THE
AMERICAN CYCLOPÆDIA:

A
Popular Dictionary
OF
GENERAL KNOWLEDGE.

EDITED BY
GEORGE RIPLEY AND CHARLES A. DANA.

WITH SUPPLEMENT.

VOLUME XII.
MOTT—PALES.

NEW YORK:
D. APPLETON AND COMPANY,
1, 3, AND 5 BOND STREET.
LONDON: CAXTON HOUSE, PATERNOSTER SQUARE.
1883.

ENTERED, according to Act of Congress, in the year 1861, by D. APPLETON AND COMPANY, in the Clerk's Office of the District Court of the United States for the Southern District of New York.

ENTERED, according to Act of Congress, in the year 1875, by D. APPLETON AND COMPANY, in the Office of the Librarian of Congress, at Washington.

ENTERED, according to Act of Congress, in the year 1880, by D. APPLETON AND COMPANY, in the Office of the Librarian of Congress, at Washington.

ENTERED, according to Act of Congress, in the year 1883, by D. APPLETON AND COMPANY, in the Office of the Librarian of Congress, at Washington.

Among the Contributors to the Twelfth Volume of the Revised Edition are
the following :

FREDERIC ADAMS, Newark, N. J.
ORANGE, N. J.

A. ARNOLD.
MOWING AND REAPING MACHINES.

PAUL ARPIN, late Editor of the *Courrier des
États-Unis*.

THE

AMERICAN CYCLOPÆDIA.

MOTT

MOTT, Lucretia (COFFIN), an American minister of the society of Friends, born in Nantucket, Jan. 3, 1793. In 1804 her parents removed to Boston, where she went to school; subsequently she attended a boarding school in Dutchess co., N. Y., in which when 15 years old she became a teacher. In 1809 she rejoined her parents, who had removed to Philadelphia, and in 1811 married James Mott, who went into partnership with her father. In 1817 she took charge of a school in Philadelphia, and in 1818 began to preach. She travelled through New England, Pennsylvania, Maryland, and a part of Virginia, advocating the tenets of the Friends and speaking against intemperance and slavery. In the division of the society in 1827 she adhered to the Hicksites. She took an active part in the organization of the American anti-slavery society in Philadelphia in 1833, and was a delegate to the world's anti-slavery convention in London in 1840, but, with other woman delegates, was refused membership on account of her sex. She took a prominent part in the first woman's rights convention, held in 1848 at Seneca Falls, N. Y., over which her husband presided; and since then she has been conspicuous in such conventions and in yearly meetings of Friends. She still (1875) resides in Philadelphia.

MOTT, Valentine, an American surgeon, born at Glen Cove, Long Island, Aug. 20, 1785, died in New York, April, 26, 1865. He graduated as M.D. at Columbia college in 1806, and studied in London and Edinburgh. In 1809 he was called to the chair of surgery in Columbia college, which he held till the medical department of that institution was merged in the college of physicians and surgeons in 1813. He withdrew from that school in 1826, and with Dr. Hosack, Dr. Francis, Dr. Mitchell, and others, founded the Rutgers medical college, which, owing to a question about its

charter, existed but four years. Subsequently he lectured in New York in the college of physicians and surgeons, and in the university medical college, as professor of surgery and regional anatomy, to which last branch he devoted special attention. His professional reputation is mainly due to his original operations as a surgeon. As early as 1818 Dr. Mott placed a ligature around the brachio-cephalic trunk, or arteria innominata, only two inches from the heart, for aneurism of the right subclavian artery, for the first time in the history of surgery. Though all apparent supply of blood vessels was cut off from the right arm, pulsation could be distinctly felt in the radial artery, and the limb presented no evidences of sphacelation. On the 26th day, however, secondary hæmorrhage having set in, the life of the patient was speedily terminated. He successfully removed the entire right clavicle for malignant disease of that bone, where it was necessary to apply 40 ligatures. He was also the first to tie the primitive iliac artery for aneurism. He tied the common carotid 46 times, cut for stone 165 times, and amputated nearly 1,000 limbs. He early introduced an original operation for immobility of the lower jaw, and succeeded after many eminent surgeons had failed. In 1821 he performed the first operation for osteo-sarcoma of the lower jaw. He was the first surgeon who removed the lower jaw for necrosis. Up to an advanced period of life he continued to lecture and practise. He had been elected a member of the principal European medical societies, and made a knight of the fourth order of the Medjidieh of Turkey. Sir Astley Cooper said in regard to Dr. Mott: "He has performed more of the great operations than any man living, or that ever did live." In 1835 he visited Europe for his health, and travelled extensively through England, the continent, and the East. His

principal works are: "Travels in Europe and the East" (New York, 1842); translation of Velpeau's "Operative Surgery" (4 vols.); "Anniversary Discourse before the Graduates of the University of New York" (1860); "Mott's Cliniques," reported by Samuel W. Francis (1860); and several separate papers concerning special operations and cases, in medical periodicals and in the "Transactions" of the New York academy of medicine.

MOTTE (or **Mothe**) **CADILLAC**. See **CADILLAC**.

MOTTEVILLE, Françoise Bertaut de, a French authoress, born about 1621, died Dec. 29, 1689. She was brought up at the court of Anne of Austria, wife of Louis XIII.; but as Richelieu objected to the influence of her mother, who was of Spanish origin, she went with her parents to Normandy. She married in 1639 the octogenarian Langlois de Motteville, after whose death she rejoined Anne, now queen regent, in 1643, in whose service she remained until the death of the latter in 1666. Sainte-Beuve praises her tact and sagacity and her spotless life. Her *Mémoires* (5 vols., Amsterdam, 1723; new ed., 6 vols., 1739; 11 vols., Paris, 1822-'3) are regarded as the best authority on the history of the Fronde and the minority of Louis XIV., and are classed by Marmontel next to those of Mme. de Lafayette as the best works written by a woman.

MOTTEZ, Victor Louis, a French painter, born in Lille, Feb. 13, 1809. He studied under Ingres and Picot, and exhibited many fine religious paintings, and also several mythological pieces, including "Leda" and "Ulysses and the Sirens." His best known portraits are those of Guizot and Mlle. Judith. After five years' residence in London, he returned to Paris in 1856, and in 1864 completed paintings for the churches of St. Germain l'Auxerrois, St. Séverin, and St. Sulpice, his masterpieces. Among his later works are "Medea" (1865), "The Cursing of the Serpent," and "The Virgin bruising the Serpent's Head" (1869).

MOUFFLON. See **SHEEP**.

MOULD, Jacob Wrey, an American architect, born at Chiselhurst, England, Aug. 7, 1825. His father was a parliamentary solicitor in London. He graduated at King's college, London, in 1842, and studied under Owen Jones and Lewis Vulliamy, with both of whom he was associated in some of their most important works. In 1852 he removed to America, and after executing several buildings in and about New York, he was employed in the architectural department of the works in the Central park. In 1870 he was appointed architect-in-chief to the department of public parks. His designs are distinguished for picturesqueness of outline and originality of detail. His principal works are the church of the Messiah, a Presbyterian church in 42d street, the church of the Holy Trinity, and several buildings and structures in the city parks. In March, 1875, he was appointed architect-in-chief of the public works in Lima, Peru.

MOULINS, or **Moulins-sur-Allier**, a town of France, capital of the department of Allier, on the river Allier, 162 m. S. S. E. of Paris; pop. in 1866, 19,890. It is the seat of a bishop, and has many educational establishments and learned societies. Among the principal buildings are the cathedral of Notre Dame (which was founded in 1468 as a collegiate church, and was completed in 1861), the college, museum, hôtel de ville, public library, barracks, and hospital. Hardware and cutlery, silk and cotton hosiery, woollen and cotton goods, articles in ivory, and catgut are manufactured; and it has a trade in iron, wood, leather, charcoal, coal, wine, oil, salt, and cattle. Moulins was formerly the capital of Bourbonnais, and the dukes of Bourbon kept their court there with great splendor. But a single tower now remains of their once famous castle.

MOULMEIN. See **MAULMAIN**.

MOULTON, Louise Chandler, an American authoress, born in Pomfret, Conn., April 10, 1835. In 1855 she was married to William U. Moulton of Boston, where she now lives (1875), but has a summer residence at Pomfret. She has been a contributor to periodicals from her 15th year, and has published the following books: "This, That, and the Other" (12mo, Boston, 1854); "Juno Clifford," a novel (New York, 1855); "My Third Book," a collection of stories (1859); "Bedtime Stories" (Boston, 1873); "Some Women's Hearts," a collection of novelettes (1874); and "More Bedtime Stories" (1874).

MOULTRIE, a central county of Illinois, drained by the Kaskaskia river and its branches; area, 320 sq. m.; pop. in 1870, 10,385. It has a level or undulating surface and a fertile soil. The Terre Haute, Paris, and Decatur, the Chicago and Paducah, and the Chicago and Illinois Southern railroads traverse it. The chief productions in 1870 were 213,564 bushels of wheat, 1,753,141 of Indian corn, 263,992 of oats, 59,263 of potatoes, 21,010 lbs. of tobacco, 56,679 of wool, 247,264 of butter, and 9,214 tons of hay. There were 6,274 horses, 3,254 milch cows, 6,695 other cattle, 20,531 sheep, and 2,300 swine. Capital, Sullivan.

MOULTRIE, Fort, a fortification on Sullivan's island at the mouth of Charleston harbor, where a victory was gained, June 28, 1776, by the South Carolina troops under Col. William Moultrie over a British fleet commanded by Sir Peter Parker. Early in that month the fleet of 40 or 50 sail arrived off Charleston with a view of investing that place. A fort which Moultrie was then building was ordered to be finished at once. On the morning of the attack it consisted of a square with a bastion at each angle, built of palmetto logs laid in parallel rows 16 ft. apart, the interspaces being filled with sand. It mounted 26 guns, and had a garrison of 435 men. Four vessels of the British fleet, with 156 guns, anchored at a distance of 350 yards and opened fire; but the balls, sinking into the soft wood, produced lit-

tle effect, while the fire from the fort was very destructive to the vessels. The whole number of guns carried by the attacking fleet was 262, on eight vessels. The action lasted, with some intermissions, from about noon until after 9 o'clock in the evening, when such of the vessels as were not disabled drew off. Several auxiliary attempts were made in the mean while by other parts of the British force, but without result. The loss of the British was 205 killed and wounded; that of the Americans 11 killed and 26 wounded. In December, 1860, Fort Moultrie was occupied by a United States force under Major Robert Anderson, who on the 26th withdrew to Fort Sumter. (See ANDERSON, ROBERT.) Fort Moultrie now exists only in name. Sullivan's island, upon which it stood, after being almost devastated during the civil war, has since come to be a suburb and watering place of Charleston.

MOULTRIE, William, an American soldier, born in South Carolina in 1731, died in Charleston, Sept. 27, 1805. In 1761 he was appointed a captain of foot in a militia regiment raised against the Cherokees. At the outbreak of the revolutionary war he was appointed to the command of the second colonial regiment, and he also represented the parish of St. Helena in the provincial congress of 1775. In March, 1776, he was ordered to construct a fortress on Sullivan's island at the mouth of Charleston harbor, and was busy at the work when the enemy made his appearance. (See MOULTRIE, FORR.) In commemoration of Moultrie's bravery in defending the fort, it was subsequently called after his name. He was soon after put upon the continental establishment, was made a brigadier general, Sept. 16, 1776, and in February, 1779, he defeated a superior British force under Col. Gardner, near Beaufort. In May following, with about 1,200 militia, he opposed the advance of Gen. Prevost on Charleston, and held the city until the approach of Gen. Lincoln compelled Prevost to retire to Savannah. In the spring of 1780 Charleston was attacked for the third time by a strong land and sea force, and Moultrie, who was second in command, shared in the capitulation of the American troops. While a prisoner he was approached by the British officers with offers of pecuniary compensation and the command of a British regiment stationed in Jamaica if he would leave the American service. He replied: "Not the fee simple of all Jamaica should induce me to part with my integrity." After remaining nearly two years a prisoner, he was permitted to go to Philadelphia, where in February, 1782, he was exchanged for Gen. Burgoyne. He was made a major general, Oct. 15, 1782. In 1785 he was elected governor of South Carolina, and again in 1794. After the close of his term in 1796 he devoted most of his remaining years to the preparation of his "Memoirs of the Revolution" (2 vols., New York, 1802).

MOUND BIRD. See BRUSH TURKEY.

MOUNDS. See AMERICAN ANTIQUITIES.

MOUNDSVILLE, a town and the capital of Marshall co., West Virginia, 12 m. below Wheeling, on the left bank of the Ohio, between two streams called Big and Little Grave creeks; pop. in 1870, 1,500. The post office name was formerly Grave Creek. It derives its present name from a mound in the vicinity, one of the largest of the ancient mounds in the United States, and one of the most interesting of American antiquities. It is connected with a series of earthworks of ancient construction, and is 820 ft. in circumference at the base, about 70 ft. high, and at the summit 63 ft. in diameter. In 1838 a shaft was sunk from the apex of the mound to its base, and a horizontal tunnel made from the exterior of the base to the centre. Two sepulchral chambers were found, one at the base, the other 30 ft. above it. These chambers had been constructed of logs and covered with stones, but had sunk in from the decay of the woodwork. One skeleton was found in the upper chamber, and two in the lower. There were also found in these chambers nearly 4,000 shell beads, several ornaments made of mica, copper bracelets, and articles carved in stone. Ten other skeletons in an advanced stage of decay were found in making the excavation. It is asserted that among the articles dug from it was a small stone on which was sculptured an alphabetical inscription. This tablet is of dark, compact, silicious rock, and is oval, $1\frac{1}{2}$ in. long and $1\frac{1}{2}$ in. broad. It is of rude workmanship, but the characters are all distinct. The inscription consists of three lines and of 22 characters, with an ideographic sign. Much diversity of opinion exists as to the nature and origin of this inscription. Dr. Wills De Hass of Virginia, in a paper read before the American ethnological society at New York, adduced evidence and arguments which seem to establish the authenticity of the tablet, of which strong doubt had been expressed. He maintained that similar ones have been found in the mounds composing the Grave Creek group, among others a small globular stone having five characters enclosed in a cartouche.

MOUNT, William Sidney, an American painter, born in Setauket, L. I., Nov. 26, 1807, died there, Nov. 19, 1868. In 1826 he entered the school of the national academy of design, in 1828 painted his first picture, a portrait of himself, and produced afterward in New York "The Daughter of Jairus," a full-length portrait of Bishop Onderdonk, and several clever portraits of children, which gave him reputation; but he soon returned to Setauket, where he devoted himself wholly to genre art. His first picture of this class, a "Rustic Dance," was exhibited in New York in 1830, and was followed in succeeding years by "Husking Corn," "Walking the Crack," "Farmer's Nooning," "Wringing the Pigs," "Turning the Grindstone," "The Raffle," "The Courtship," "Boys Gambling in a Barn," "Turn of the

Leaf," "The Power of Music," "Music is Contagious," "Raffling for a Goose," "Just in Time," "California News," "Banjo Player," "Dance of the Haymakers," and others, most of which are in private galleries in New York, and "Bargaining for a Horse," in the New York historical society's collection. He excelled especially in humorous pictures of American rustic life, and in delineations of negro life and physiognomy.

MOUNTAIN, a considerable elevation of the earth's surface, either isolated or arranged in a linear manner. Great regions of the earth are much elevated above the sea, forming high plains, called table lands or plateaus, from which mountains often rise. Such are the great plain of Thibet, with an average height of 16,000 ft.; that of western Asia, from 4,000 to 8,000; and that of western North America, of about the same height, from which rise the Rocky mountains and the Sierra Nevada. The elevation of mountains is generally calculated from the sea level. With few exceptions the mountains of the earth are arranged in continuous lines or chains, and a mountain system consists of parallel chains with intervening valleys. The great mountain system of the American continent is that which has been called the Pacific highlands, extending from Alaska to Cape Horn along the W. part of the continent. It consists in the United States, exclusive of Alaska, of the Rocky mountains to the east and the Sierra Nevada and Cascade mountains to the west, rising from the broad table land already mentioned, and having between them the great central basin with its subordinate mountain ranges. The highest points in both of these chains attain about 15,000 ft. The highest mountains in Alaska (Mt. St. Elias) and Mexico (Popocatepetl and Orizaba) rise to a height of nearly 18,000 ft. In South America the same great continental system consists of two, and in some parts of its course of three chains, separated by narrow elevated valleys. The general breadth of the whole system of the Andes is between 100 and 300 m., and the greatest height is attained in the plateau of Bolivia and in Chili, where there are peaks of from 20,000 to 23,000 or, according to some, 25,000 ft. In eastern North America are the Atlantic highlands or Appalachians, extending from the gulf of St. Lawrence to Alabama; these attain their greatest elevation in the Black mountains of western North Carolina, where there are several peaks of over 6,000 ft., one reaching 6,700 ft., and in New Hampshire, where the highest, Mt. Washington, is 6,285 ft. In the intermediate portions the heights are less, and in New York the tidal valley of the Hudson traverses the range. To the north and west of the Hudson are the Adirondack, Helderberg, and Catskill mountains, which in their continuation southward form the Alleghany and Cumberland mountains. Between this belt and the eastern one, which, extending from the Green mountains and

White mountains of New England, and the Highlands of the Hudson, takes the name of the Blue Ridge S. of the Potomac, lies what is called the great Appalachian valley, which itself attains a considerable elevation in S. W. Virginia.—From the plateau of Brazil rises along its E. portion a chain corresponding to the Appalachian; and in Africa there are similar highlands on the two sides of the continent, those of the eastern attaining an elevation of 20,000 ft. A like arrangement of highlands is seen in Australia, where however the highest elevation is about 7,000 ft. In Europe the Scandinavian and the Ural mountains are N. and S. chains, like the Appalachians; but the great mountain systems of the eastern hemisphere have a general E. and W. direction from the Atlantic to the Pacific. The Pyrenees, the Alps, the Balkan, the Caucasus, the Himalaya, and various subordinate ranges, mark this great mountain belt. Of these the Pyrenees have a crest line of about 8,000 ft., but attain in some peaks 11,000; the Alps have an average height of from 10,000 to 12,000 ft., the highest peak being Mont Blanc, 15,732 (or 15,781) ft., while the Himalayas rise in many points to 25,000 ft., and attain in Mt. Everest 29,000 ft., and the Thian-shan range, N. of these, is from 15,000 to 20,000 ft. The chains of this great mountain region of the eastern hemisphere are not always parallel, but are often considerably divergent.—The slopes of mountains are generally very gradual. Thus the average ascent of the Andes from the E. side is about 60 ft. in a mile, and on the bolder W. slope from 100 to 150 ft. in a mile; while for the E. slope of the Rocky mountains the average ascent to the great plateau is not more than 10 ft. in a mile. A much more rapid inclination than any of these is seen for isolated peaks, of which a very remarkable sample is Mont Blanc, which rises from the valleys on either side at an inclination of about 30°. The slope of the volcanic cone of Jorullo in Mexico is about the same, while those of Mt. Etna and Mauna Loa in the Hawaiian islands (reckoning from the base) are not more than 5° or 6°. The relations of mountains to climate are very important, but the discussion of them belongs to meteorology.—The early history of mountains, or orography, as it is called, presents crude notions. By the older geologists mountains were supposed to be thrust up by some force from within, and were compared to bubbles on the earth's crust. Some geologists of the present century have maintained this notion, and have even speculated upon the cataclysmal effects of a sudden upheaval of a mountain chain like the Pyrenees from beneath the ocean. But these conceptions have given place to more rational ideas. We must distinguish two classes of mountains, of widely different origin: those which are produced by the accumulation of matters ejected from volcanic vents, and those which have been formed by erosion. The first class, of

which Etna and Vesuvius may be taken as types, have been built up as an ant hill is raised by matters brought grain by grain from below the surface. Successive overflows of molten rock or lava, and showers of dust and scoriæ, the solidified scum of the lava, have heaped up these volcanic cones; while from time to time fissures or ruptures in the mass have allowed the injection of dikes of molten matter, which in cooling have given solidity to the whole. Volcanic cones are in fact generated in the air by the force of gravity. Volcanic vents may occur alike beneath the sea, in low plains, or on elevated plateaus, and sometimes from the summits of mountains not themselves volcanic. (See VOLCANO.) But the mountains of purely volcanic origin are insignificant when compared with the great systems of mountains which are not volcanic, or in which the presence of volcanic vents is but a secondary fact. These mountains, whether composed of aqueous or of igneous rocks, have had a very different origin from volcanic cones. They are due to erosion, and are the remains of great plateaus, the larger part of which has been removed. They are but fragments of the upper crust of the earth, separated from each other by valleys which represent the absence or the removal of mountain land. The popular conception is that mountain chains are due to the folding and plication of strata; but careful study of their structure shows that these are but accidents of structure, in no way essential to the formation of mountains, and sometimes absent. To De Montlosier and to J. P. Lesley we owe our first conceptions of the true nature and origin of mountains and valleys, and to James Hall its further elucidation and its illustration by the facts of North American geology. That the crust of the earth is not rigid, but yielding, and subject to movements of depression and elevation, due to a disturbance of its equilibrium, which have in all ages been operating, is evident from the distribution of sedimentary deposits in past geological periods. In addition to these there are other movements which are conceived to be due to the contraction of the earth's nucleus, resulting also in movements of depression and elevation of the surface, and in corrugations of portions of the crust. The result of these is seen in undulations of the stratified rocks, which are sometimes very slight and regular, but at other times both marked and irregular, occasionally giving rise to great overturns, folds, or inversions, and sometimes enclosing a portion of the rocks in a great fold until there is an inversion of the pinched-up strata on both sides of the axis of the fold, by which they come to present a fan-like structure when seen in transverse section. In other cases occur breaks or slidings of the strata on one another, and frequently more or less nearly vertical displacements, or faults, as they are called, by which the strata on one side of a line of fracture may be raised several thousand feet above

the same strata on the other side. These various disturbances of the strata influence in many ways the eroding agencies of the elements, so that the mountain outlines and the distribution of mountains and valleys depend upon these accidents, though not the elevation of the mountain plateau. Thus the crest of a fold from which the strata dip in opposite directions, making what is called in stratigraphy an anticlinal axis, will generally be fractured by the strain which this part has suffered, and will then present a line of weakness which becomes a line of erosion. Valleys are thus cut out, and the strata between the adjacent anticlinals, escaping the eroding action, form a synclinal mountain range, the beds in their natural order dipping from the valleys on each side toward the centre of the mountain. Such a condition of things is seen in the anthracite region of Pennsylvania, in the Catskill mountains of New York, and in western Vermont. From irregularities in the undulations, from faults, or from the intervention of harder and softer beds, it often happens that the process of erosion is less regular than this. Sometimes an anticlinal mountain appears; at other times an anticlinal mountain is divided, presenting two monoclinal mountains, or, as the result of a great fault in the strata, a single mountain of this kind in which the strata dip to one side. For a further discussion of the various forms of mountain structure, see Lesley's "Manual of Coal and its Topography."—The structure of mountains is best studied in regions of uncrystalline rocks, where the strata have not been too much disturbed, and where stratification is very evident, as in the palæozoic rocks of the Appalachians. In the crystalline eozoic rocks of this mountain system, where the strata are greatly disturbed and nearly vertical, the study of mountain structure is much more difficult. Mountains do not owe their elevation to any folding, or crushing, or piling up of the strata. The influence of folding has been well pointed out by Hall, who has shown the relations of the elevations of palæozoic rocks in the United States to the accumulation of sediments. In the upper part of the Mississippi valley, where the palæozoic rocks are represented by 3,000 or 4,000 ft. of sediments, we find hills made up of horizontal strata, the lower Cambrian rocks which form the base of the hills being everywhere above the water level, while the height of the hills is equal to the vertical thickness of the strata which compose them. In Pennsylvania, on the contrary, where the palæozoic strata have a vertical thickness of about 40,000 ft., the synclinal mountains, having in their summits the upper beds of the series, are not more than 2,000 or 3,000 ft. high, the greater part of the strata having been removed from the anticlinal valleys while they are sunk far beneath the mountains. It follows from what has been said that in horizontal and synclinal mountains the newer rocks are at the top and the older ones at the base,

but in overturned and dislocated strata this is of course no longer the case. In regions where, as the result of great folds and overturns, the fan-like structure already described has been produced, the older rocks from beneath are made to surmount and rest upon the newer strata, which have folded and doubled up beneath them. The erosion of such a region gives rise to a mountain like Mont Blanc; in this the ancient crystalline strata, which elsewhere form the floor upon which repose the newer stratified rocks, rise above these, forming the summit of the mountain, while at lower levels on its flanks the newer strata seem to dip toward the centre of the mountain, but are really bent upon themselves and doubled up, as is seen in the valley of Chamouni. Mont Blanc, which served as a type to the early students of geology, is thus an exception. The crystalline strata which form its summit were looked upon as an upthrust of granite which had lifted upon its sides the newer stratified rocks, thus giving the mountain, as was imagined, an anticlinal structure. In the process of sculpturing the earth's surface by ocean currents, frost, rain, and rivers, the unequal erosion exposes the harder masses, and thus eruptive rocks lying in the midst of softer strata appear in the form of hills, as is seen in the trappean ranges of New Jersey and the Connecticut valley. Isolated peaks of a similar origin are found in the vicinity of Montreal, and are denuded masses of eruptive rock which were once included in the soft palæozoic strata of the region long since removed by erosion. They were perhaps the stocks or underground portions of volcanoes in palæozoic times.—The question of the geological age of mountains is twofold, including, first, that of the deposition of the rocks of which they are composed, and second, that of their uplifting and erosion. Élie de Beaumont, considering only the latter question, supposed all mountain chains having the same direction on the earth's surface to be of the same age; but this notion is no longer tenable, since a great mountain chain, such as the Appalachians, exhibits considerable variations in different parts of its course, from a N. and S. direction in parts of New England to one nearly E. and W. in other parts of its extension. As regards the age of the rocks of this great chain, while the Green and White mountains, the Adirondacks, and the Blue Ridge are eozoic, the Catskills, the Alleghanies, the Unaka, and the Cumberland ranges are composed of palæozoic sediments, and the whole Appalachian system was not uplifted until after the deposition of the coal. The study of the Alps shows that the elevation of this great mountain system was still later, since even tertiary rocks are involved in the folds and inversions of the strata.

MOUNTAIN. I. Jacob, a Canadian bishop, born in Norfolk, England, in 1750, died in Quebec, June 16, 1825. His grandfather, Jacob de Montaigne, a great-grandson of Montaigne the

essayist, was banished from France by the revocation of the edict of Nantes. He graduated at Caius college, Cambridge, in 1774, became a fellow in 1777, and in 1781 was nominated to the living of St. Andrew's, Norwich, holding besides several other livings. In 1793 he was appointed first Protestant bishop of Quebec. He found but nine clergymen in his diocese, and labored for 30 years to build churches and schools and to promote the spiritual welfare of his flock. II. George Jehoshaphat, second son of the preceding, born in Norwich, July 27, 1789, died in Quebec, Jan. 8, 1863. He graduated at Trinity college, Cambridge, in 1810, was ordained priest in 1813, and appointed evening lecturer in his father's cathedral. In 1814 he was nominated rector of Fredericton, New Brunswick, and in 1817 rector of Quebec and bishop's official. In 1821 he became archdeacon, and in 1825, during a mission to England, he received the degree of D. D. On his return Bishop Stuvard appointed him his examining chaplain, and in 1835 he was sent to England on business connected with the question of the clergy reserves. While there he was appointed bishop of Montreal, and given the entire charge of the Episcopal church in Lower Canada. He continued to administer the dioceses of Quebec and Montreal till 1850, when he assumed the title of bishop of Quebec. In 1844 he visited the missions on Red river, composing during his journeys "Songs of the Wilderness" (London, 1846). He was the founder of Bishop's college, Lennoxville, and of the church society, spending most of his income for these institutions and for charitable purposes. Some time before his death he declined the dignity of metropolitan of Canada. He published sermons and addresses, and a "Journal of a Northwest American Mission" (London, 1843).

MOUNTAINS OF THE MOON, a mountain range said to exist in central Africa, in which Ptolemy and other ancient geographers placed the sources of the Nile. On modern maps, until recently, the name was given to a great range which was supposed to cross the continent from the Indian ocean to the Atlantic. It is now known that no such range exists. Capt. Speke applied the name in 1858 to a range N. of the newly discovered lake Tanganyika, though incorrectly, according to Capt. Burton.

MOUNT AUBURN. See CAMBRIDGE (Mass.).

MOUNT DESERT, an island of the state of Maine, at the southern extremity of Hancock co., in Frenchman's bay, about 30 m. S. E. of Bangor; pop. in 1870, 3,935. The island is 14 m. long and 8 m. broad, and has an area of about 100 sq. m. It is divided into three towns, Eden, Mount Desert, and Tremont, and contains 11 post offices, 15 or 20 hotels, 35 school houses, and 6 churches. Ship building and the manufacture of lumber are carried on, and the cod and mackerel fisheries are pursued. A narrow bay or sound runs from the ocean at the S. side of the island into the interior in a northerly direc-

tion to the distance of 6 or 8 m. The scenery of the island is very grand and beautiful. The greater part of its surface is covered by seven ridges of mountains, whose highest peak, Mt. Adam or Mt. Green, rises 1,762 ft. above the sea. High up among the mountains are many beautiful lakes, the largest of which is several miles long. The S. E. coast is lined with stupendous cliffs; the most remarkable of these are Great Head and Schooner Head. In Frenchman's bay, on the E. side of Mount Desert, are five high rocky islands called the Porcupines, and about 20 m. to the southward in the open ocean is Mount Desert rock, the site of a noted lighthouse. Mount Desert is much resorted to in summer for the beauty of its scenery.—The island was discovered and named by the French about the beginning of the 17th century. M. de La Saussaye and Fathers Quentin, Lalemant, Biard, and Masse, with 25 colonists from France, landed here in May, 1613, built a small fort and a few cabins, and called the place St. Sauveur. This settlement was forcibly broken up in a few weeks by Gov. Argall of Virginia. The first permanent settlement was made by Abraham Somes, who in 1761 built a house at the head of the sound.

MOUNT EVEREST. See HIMALAYA MOUNTAINS, vol. viii., p. 732.

MOUNTFORD, William, an American clergyman, born in Kidderminster, England, May 31, 1816. He was educated at Manchester New college, and was minister of a Unitarian chapel in Manchester from 1838 to 1841, when he went to Lynn-Regis. In 1850 he removed to the United States, and soon after became minister of the first Unitarian church in Gloucester, Mass. He was in France and Italy from 1856 to 1860, when he returned, and has since resided in Boston. He has published "Martyria, a Legend" (London, 1845; Boston, 1846);

"Christianity the Deliverance of the Soul and its Life," sermons (London, 1846); "Euthanasia, or Happy Talks toward the End of Life" (Boston, 1848; with additions, 1850; new ed., 1874); "Thorpe, a quiet English Town, and Human Life therein" (1852); and "Miracles, Past and Present" (1870).

MOUNT PLEASANT, a town and the capital of Henry co., Iowa, on the Burlington and Missouri River railroad, 25 m. W. N. W. of Burlington, and 110 m. E. S. E. of Des Moines; pop. in 1870, 4,245. It stands on an elevated prairie, surrounded on all sides but the east by Big creek, an affluent of Skunk river. The adjacent country is highly productive. The town is the seat of one of the state asylums for the insane, and of Iowa Wesleyan university and German college, both under the control of the Methodists. The university was established in 1855, admits both sexes, and has preparatory, collegiate, theological, and law departments, and a school of pharmacy. In 1873-'4 it had 14 instructors, 200 students, and a library of 3,000 volumes. German college was organized in 1873, and in 1873-'4 had 4 instructors and 15 students. Mount Pleasant has graded public schools, a high school, two national banks, two weekly newspapers, two monthly periodicals, and eleven churches.

MOUNTRAILLE, a N. W. county of Dakota, bordering on British America, and bounded S. W. by the Missouri river, recently formed, and not included in the census of 1870; area, about 3,200 sq. m. It is drained by White Earth and Little Knife rivers, affluents of the Missouri, and by a fork of Mouse river. The surface is elevated, being occupied by the Plateau du Coteau du Missouri.

MOUNT SAINT ELIAS. See ALASKA.

MOUNT VERNON, the home and burial place of George Washington, on the right bank of

Mount Vernon.

the Potomac in Fairfax co., Va., 9 m. S. by W. of Alexandria and 15 m. from Washington

city. At the time of Washington's decease the estate comprised several thousand acres. The

mansion is beautifully situated on a swelling height crowned with trees and commanding a fine view up and down the Potomac. The house is of wood, two stories high and 96 ft. long, with a lofty portico extending along the whole front. On the ground floor are six rooms, none large except the dining room. The library and Washington's bedroom remain as they were at the time of his death, and contain many articles of great interest. In front of the house sloping to the river is a lawn of five or six acres. About 300 yards S. of the mansion, on a hillside in full view of the river, is the old family vault, where the body of Washington was first laid and remained till 1830, when it was removed to a new vault at no great distance on the edge of a deep wooded dell. Mount Vernon mansion was built by George Washington's elder brother Lawrence, who settled there in 1743, and named the estate in honor of Admiral Vernon, under whom he had served in the West Indies. George Washington added wings to the mansion, and greatly enlarged and embellished the estate, which was his home from boyhood till his death. He bequeathed it to Bushrod Washington, from whom it passed to his nephew John A. Washington. By him the mansion and 200 acres of land were sold in 1858 for \$200,000 to the "Ladies' Mount Vernon Association," who design to hold it in perpetuity as a place of public resort and pilgrimage.

MOUNT VERNON. I. A city and the capital of Knox co., Ohio, on the N. bank of Vernon river, and on the Cleveland, Mt. Vernon, and Columbus railroad, and the Lake Erie division of the Baltimore and Ohio line, 40 m. N. N. E. of Columbus; pop. in 1870, 4,876. It is well and compactly built on gently ascending ground, is lighted with gas, and has many handsome residences. It is surrounded by a fertile and well cultivated country, and has considerable trade. The river affords good water power. The city contains two iron foundries, a woollen factory, two flouring mills, two saw mills, two national banks, graded public schools, including a high school, two weekly newspapers, and eleven churches. It was laid out in 1805. II. A town and the capital of Posey co., Indiana, on a bend of the Ohio river, in the S. W. corner of the state, and on the St. Louis and Southeastern railroad, 160 m. S. W. of Indianapolis; pop. in 1870, 2,880. It stands on a bluff commanding a view of the river, and has an active trade. It contains two banks, two flouring mills, two saw mills, a foundry, a planing mill, and other manufactories, several schools, two weekly newspapers, and seven churches.

MOURNING, an outward manifestation of grief, particularly on occasions of death. Every nation has some conventional form of mourning. The ancient Hebrews tore their garments, dishevelled their hair, threw dust or ashes on the head, and abstained from washing. During the time of mourning they sat on

the ground, and went bareheaded and barefooted. The usual period of mourning was seven days, but for Moses and Aaron they mourned a month. On public occasions professional mourning women were employed. The modern Jews preserve to some extent the customs of their forefathers, such as sitting on the ground, and making an incision in some part of their clothing to symbolize the old tearing of garments. In Jerusalem a weekly lamentation and wailing is still observed near the site of the temple. The rending of clothes was observed by the Egyptians, who also sprinkled their heads with dust and ashes, struck their breasts, allowed their hair to grow and their dress to hang neglected, went unwashed, and abstained from wine and other delicacies. The women ran crying through the streets with disordered hair and exposed bosoms. The Lycians regarded grief as unmanly, and had a law compelling men when they went into mourning to put on female garments. The Syrians wept for their dead several days in solitary places. The Persians rent their garments with wailing, and cut off their hair. The last was customary also among the Scythians.—The Greeks withdrew into retirement, cut off their hair, put on black, or in some states, as Argos, white garments, rolled themselves in the dust or mire, threw ashes on their heads, tore their clothes, never appeared in public without a veil, lacerated their faces, and frequently uttered the exclamation *ē, ē, ē*. When a popular general died, the whole army cut off their hair and the manes of their horses. In Athens the duration of mourning was about 30 days; in Sparta it was 11 days.—The Roman forms of mourning did not differ greatly from the Grecian. In the time of the republic the color of the mourning dress was black for both sexes, and it always continued so for men; but during the reign of Augustus a white veil was worn by women, and subsequently a complete costume of white became their conventional token of sorrow. Ornaments for the person were laid aside, and the men let their hair and beards grow long. The extreme duration of mourning by men was ten months, by women a year, but this period was abridged by the occurrence of any auspicious event, such as the birth of a child, the happening of any piece of good fortune to the family, certain religious feasts, or the consecration of a temple. The period of public mourning for the death of a great person or for a public disaster was fixed by special decree. At such times the forum, baths, shops, temples, schools of exercise, and other places of concourse were closed, the senators put aside the lat-clave, the consuls sat on a lower seat than usual, and the magistrates appeared without their badges of office. On private occasions the mourning was done almost wholly by the women; the men wore black only for a few days, and the domestic ceremonies in honor of the deceased terminated on the ninth day

after the funeral with a sacrifice called *novendiale*. A widow who married again during her time of mourning for a husband (ten months or a year) was accounted infamous and debarred from inheriting of her late spouse. Persons in mourning kept within doors, and the custom of tearing the garments was sometimes practised. Hired mourning women were employed at funerals by both Romans and Greeks. In the old tombs which have been opened in Palestine, Greece, and Italy are found lachrymatories or tear bottles, in which it was customary for mourners to preserve their tears.—Among the modern Syrians mourning women play a very important part at funerals. It is not unusual for families in moderate circumstances to be ruined by the expensive feasts and other commemorations which are held for weeks after the funeral.—In Arabia the men wear no mourning, and are silent in grief, but the women scream, tear their hair, and throw earth on their heads. The latter also stain their hands and feet with indigo, which they suffer to remain for eight days, and during this time they abstain from milk on the ground that its white color ill accords with the gloom of their minds. The hired mourning women of Medina dance before the house of the deceased, tearing their arms, faces, and hair.—The Chinese mourn in white, and on the death of a near relative every article of dress must be of that color. Less intense affliction is indicated simply by caps and girdles of white linen, and a very moderate degree of grief by shoes and queue cords of blue. Mourning on occasion of the death of a parent or husband is enforced by the penalties of 60 blows and a year's banishment. The duration of mourning is fixed by law. For a father or mother it is three years, but in the case of government officers it has been reduced to 27 months. During this period of mourning a Chinese cannot perform the duties of any public office. For 30 days after the demise the nearest kindred must not shave their heads nor change their dress. When the emperor dies all his subjects let their hair grow for 100 days. At funerals the relatives of the deceased furnish all who take part in the procession with mourning dresses, just as gloves and scarfs are given at the present day in Europe and America. They employ mourning women, whose faculty of shedding tears is extraordinary.—The Japanese mourning color is also white, but relatives in the ascending line and seniors neither mourn for their junior kindred nor go to their funerals. Persons in mourning stay at home for 50 days, abstain from animal food and from the intoxicating liquor *saki*, and neither shave their heads nor pare their nails. This period of 50 days, called the *imi*, is succeeded by the *buku*, or 13 months of a sort of "second mourning," during which it is not allowed to wear bright colors or enter a Shinto temple. These long periods are observed only on the death of parents; for

other relatives the *imi* and *buku* vary from 30 days and 13 months for a husband to 3 days and 7 days for cousins and their children.—In the Feejee islands, after the death of a chief, a general fast until evening is observed for 10 or 20 days, the women burn their bodies, and 50 or 100 fingers are amputated to be hung above the dead man's tomb. The ceremonies of domestic mourning consist of abstinence from delicate dishes, and from the use of oil on the person; the mourners sleep on the bare ground, and use only leaves for dress. These customs are optional; among those exacted by fashion are the "jumping of maggots," or a meeting of friends on the fourth day after the funeral to picture to themselves the corruption of the corpse, and the "causing to laugh" on the next night, when comic games are held. About the tenth day the women scourge all the men except the highest chiefs. Among the natives of New Caledonia there is a custom for women to burn parts of their bodies in time of mourning. The Hawaiians denote grief by painting the lower part of their faces black and knocking out their fore teeth. The North American Indians howl and wail, make speeches to the dead, and pierce the flesh with arrows and sharp stones.—Among all civilized modern nations there is a great similarity in mourning customs, and black is universally considered the proper color to be worn, although modern refinement has gone so far as to symbolize the gradual change from the depth of affliction to a state of cheerfulness by a gradual return from black to gay colors through the intermediate hues of purple and violet, which are recognized as "second mourning." The material of a mourning dress is also prescribed by fashion, being for ladies generally crape. The time varies, according to the degree of relationship of the deceased, from a week to a year, the latter being the period fixed by custom for a widow. Hired mourners are retained by the English as attendants at funerals, but their office is one of mere show, and they are commonly called mutes. In some parts of Ireland, however, the *keeners* or professional mourners, generally old women, are famous for their extravagant lamentations. It was anciently the custom in England to give mourning rings and suits at funerals. In Spain and France, of old, the color of grief was white. Certain forms of private as well as public mourning were prescribed by Napoleon I., but went out of use at the restoration. Court mourning in Europe for members of the reigning family, even in remote degrees, is prescribed by ceremonials which give the minutest directions as to dress. The sovereign wears violet, except in England, where the color is black; but violet was formerly used there also. The courtiers appear in black. Court mourning seldom lasts more than six months. Public mourning is not yet banished from the civilized world. It was witnessed in the United States on the death of Franklin, Washing-

ton, Lafayette, and Lincoln. Members of legislative, civic, military, and other associations usually wear a piece of crape on the left arm on public occasions for 30 days after the death of a comrade.

MOUSE, the common name of the smaller members of the rodent subfamily *murinæ*. This subfamily is characterized by incisors smooth in front and compressed laterally; molars $\frac{3}{2}$ - $\frac{3}{2}$ or $\frac{2}{2}$ - $\frac{2}{2}$, rooted, the anterior the largest; the ante-orbital foramen a deep narrow slit, widening above; palate mostly on one plane; the descending branch of the lower jaw has not the angles above the plane of the crowns of the molars; other characters in the palate and lower jaw sufficiently distinguish them from *arvicolinæ* or meadow mice; feet usually naked beneath; the hind legs the longest and five-toed, the anterior with only four and a kind of a wart for a thumb; clavicles complete; tail scaly, with hairs between the whorls of the scales. They hold their food in the fore paws, and sit on their haunches to eat it; most of them burrow and swim well. Reserving the larger species for the article RAT, this subfamily may be subdivided into two principal groups: *mures*, confined in the wild state entirely to the old world; and *sigmodontes*, exclusively American. The former have very large and broad molars, with three tubercles in each transverse series of the upper jaw; the latter have narrower molars, with two tubercles in each similar series. A third group, *merionides*, intermediate to the above, with plane molars and transverse complete lamellæ, is found in Africa and central Asia.—In the murine group of this subfamily, the genus *mus* (Linn.) has the molars of opposite sides parallel to each other, no cheek pouches, the upper lip divided, the whiskers in five series, the nose sharp and hairy to the cleft, and the large, prominent ears nearly naked; the nails are short, pointed and curved; palms naked, with five small balls, those of the hind feet the largest; the hair is soft and fine; the mammae are ten, three pairs on the

House Mouse (*Mus musculus*).

lower abdomen and two pairs on the chest. More than 50 species are described, including the house rats; the only one here called a mouse is the common little creature of our

houses (*M. musculus*, Linn.). This varies much in color, from almost black to pure white; the albino or white mice are a mere variety of the common animals, but have the ability of propagating their race *inter se*. "Singing mice" do not differ in appearance from ordinary mice, but make, especially at night, a whistling noise somewhat like the feeble chirp of a canary bird. The house mouse was originally a native of Europe and central Asia, but is now spread over most inhabited regions of the world; in some parts of the United States, and particularly in newly settled districts, it is replaced by the white-footed mouse, which commits about as much mischief in houses and out-buildings as the common mouse. Of European field mice may be mentioned the *M. sylvaticus* (Linn.), or wood mouse, found in fields and gardens, where it makes large deposits of provisions in subterranean burrows, laying up grain, nuts, acorns, &c., for winter use. It is smaller than

Nest and Head of Harvest Mouse.

the house mouse, reddish gray above, and white below; the hind legs are so long that it moves by jumps, making the transition to *meriones* (III.). The harvest mouse (*M. minutus*, Pall.; *M. messorius*, Shaw) is only $2\frac{1}{4}$ in. from end of nose to root of tail, this being about 2 in. more. These tiny mice make nests of leaves and straws among standing corn and in thistles, and are often carried into barns with the harvest, where they live and multiply; in winter they retire to burrows and corn ricks; the color is ruddy above and white below. The lined mouse (*M. pumilio*, Gmel.), from the Cape of Good Hope, weighs less than four scruples (80 grains). Some mice of the genus *dendromys* (Smith) live on trees; the upper incisors are grooved, the fore feet three-toed with a thumb-like wart, and the long tail is thinly haired and ringed; here belongs the *M. mesomelas* (Licht.).—Among the American or sigmodont mice are the genera *reithrodon* (Waterh.) and *hesperomys* (Waterh.). *Neoto-*

ma and *sigmodon* belong properly among the rats on account of the large size of all their species. In *reithrodon* the ears and tail are short and hairy, and the upper incisors are grooved longitudinally in front; three species of rat-like size have been found in the extreme southern portion of South America, while the North American ones resemble slender house mice; the body is depressed, limbs short, head broad and short, tail about as long as the body, thumb rudimentary and with a short nail, and heel hairy; the North American species are found in the southern states on the Atlantic border, and from St. Louis to the Pacific. The harvest mouse (*R. humilis*, Baird) is about 2½ in. long, with the tail a trifle less; in color and general appearance it so nearly resembles a small house mouse, that it can only be distinguished at the first glance by the grooved incisors; the eyes are small; it is rarely injurious to the farmer, preferring grass lands to grain fields for its habitation. In *hesperomys* or the vesper mice, the typical species have long tails scantily haired, large ears, the quick motions of the common mouse, and generally white feet and a whitish tail. The old genus was of very great extent, embracing a large portion of the American *muridæ*; the South American species, most of them too large to be considered mice, have been arranged by Burmeister under the genera *calomys*, *habrothrix*, and *oryzomys*, established by Waterhouse, the first resembling the common mouse, the second the meadow mice (*arvicolæ*), and the third the lemmings. Baird divides even the North American species into three groups, as follows: *hesperomys* (Waterh.), containing 13 species; *onychomys* (Baird) and *oryzomys* (Baird), each with a single species. In *hesperomys* the form is mouse-like, tail not less, or even longer than the body without the head, claws weak, hind legs and feet long, and soles naked or less than half hairy. The white-footed or deer mouse (*H. leucopus*, Le Conte) is between 3 and 4 in. long, with tail about the same; the color of the adult is yellowish brown above, darker on the back, the lower

Deer Mouse (*Hesperomys leucopus*).

parts of the body and tail and the upper surface of the feet white; the young are dark slaty; the eyes and ears are large, and the fur long and soft. It is distributed from Nova

Scotia to Virginia, and as far west as the Mississippi, and is a common inhabitant of houses and barns; it is nocturnal in its habits, as active as a squirrel, nesting in trees, in the fields, in barns and houses, and making a dwelling resembling a bird's nest; it feeds principally on grain, seeds, nuts, and acorns, and is very fond of maize; it produces two or three broods in a season, according to latitude, five or six at a birth; it is not very injurious to the farmer, most of the mischief commonly attributed to it being due to the *arvicolæ* or meadow mice; great numbers are destroyed by the smaller carnivorous mammals and birds. Allied species are found in Texas, California, the southern states, and on the Pacific coast. The cotton mouse (*H. gossypinus*, Le Conte) makes its nest under logs and in trees, often robbing the planter of more than a pound of cotton for a single nest. The hamster mouse (*H. myoides*, Gapper) is mentioned under HAMSTER. The prairie mouse (*H. Michiganensis*, Wagner) is 3½ in. long, with a tail of 1½ in., and the smallest of the genus; the color is grayish brown above, whitish beneath, with the cheeks yellow. The Missouri mouse (*H. leucogaster*, Fr. Max.), the type of the group *onychomys*, has the clumsy form of the *arvicola*, tail less than half the head and body, claws large and fossorial, the posterior two thirds of the soles densely furred, and the skull without crest; the body is 4 in. long and the tail 3½ in.; grayish brown above, passing into yellowish red and fulvous on the sides; feet and under surface of body and tail white; the eyes are large, the ears rather short, and the whiskers long; it lives on the seeds and roots of wild plants, and sometimes on corn. The rice-field mouse (*H. palustris*, Wag.), the type of *oryzomys* of Baird, has a rat-like form, ears nearly buried in the fur, coarse hair, tail longer than head and body, hind feet long, soles naked, and upper margin of the orbit raised into a compressed crest; it is more than 5 in. long, and the tail about the same; the color is rusty brown above and whitish below. It is found in the rice fields of Carolina and Georgia, burrowing in the dams just above the water line; it scratches up the newly planted rice, eats it in the milky state, and gleans it from the fields in autumn; it is a good swimmer and diver; it eats also seeds of marsh grasses, and small mollusks and crustaceans.

MOUTON, Georges. See LOBAU.

MOVERS, Franz Karl, a German orientalist, born in Koesfeld, Westphalia, July 17, 1806, died in Breslau, Sept. 28, 1856. He studied at Münster, was ordained in 1829, and officiated in the pulpit from 1830 to 1839, when he was appointed professor of Old Testament theology in the Catholic faculty of Breslau, which office he held till his death. His principal work, *Die Phönizier* (3 vols., Breslau and Berlin, 1840-'56), presents a comprehensive view of Phœnician history.

MOWATT (Ritchie), Anna Cora, an American authoress and actress, born in Bordeaux,

France (where her father, Samuel C. Ogden, a merchant of New York, was then established in business), in 1819, died in England, July 28, 1870. She was the 10th of a family of 17 children. Her early childhood was passed in a château in the neighborhood of Bordeaux, in the private theatre of which she frequently participated in juvenile dramatic performances. When she was about six years of age the family returned to New York. While at school she attracted the attention of James Mowatt, a lawyer of New York, with whom she made a runaway match in her 15th year. During the first two years of her married life she published two poems, "Pelayo, or the Cavern of Cavadonga" (1836), an epic in five cantos, and "The Reviewers Reviewed" (1837), a satire against the critics of the former poem. Her health failing, she made a visit of a year and a half to Europe, during which she wrote for private performance a play entitled "Gulzara, or the Persian Slave" (1840). After her return she gave a series of public dramatic readings in Boston, Providence, New York, and other cities. Her exertions produced a serious illness, and for two years she was a confirmed invalid, during which time she contributed to the magazines under the pseudonyme of Helen Berkley. In 1842 she published "The Fortune Hunter," a novel; in 1845 a five-act comedy entitled "Fashion," which was played at the Park theatre, New York, with considerable success; and in 1847 another drama entitled "Armand, or the Peer and the Peasant," which was represented at the Park theatre in 1848. On June 13, 1845, she made her public début at this theatre as Pauline in the "Lady of Lyons," and thenceforth for many years was a popular actress. In 1847 she made an extended professional visit to England, where in 1851 her husband died; and in 1854 she played a series of farewell engagements in the United States and left the stage. She was married on June 7 of that year to W. F. Ritchie, editor of the Richmond "Enquirer." Her later works are: "The Autobiography of an Actress" (1854); "Mimic Life" (1855); "The Twin Roses" (1857); "Fairy Fingers" (1865); "The Mute Singer" (1866); and "The Clergyman's Wife and other Sketches" (1867). She published also several compilations.

MOWER, a S. E. county of Minnesota, bordering on Iowa, and watered by several streams; area, 720 sq. m.; pop. in 1870, 10,447. It has an undulating surface, consisting mostly of prairies, and the soil is fertile. It is traversed by the Milwaukee and St. Paul and the Southern Minnesota railroads. The chief productions in 1870 were 673,017 bushels of wheat, 118,771 of Indian corn, 463,085 of oats, 39,975 of barley, 63,244 of potatoes, 7,670 lbs. of wool, 295,896 of butter, 44,470 of flax, and 18,151 tons of hay. There were 2,821 horses, 3,073 milch cows, 4,543 other cattle, 1,945 sheep, and 2,973 swine; 3 carriage factories, and 3 flour mills. Capital, Austin.

MOWING AND REAPING MACHINES, mechanical devices for cutting grain or grass by animal power. Though this invention was suggested by the ancient Romans, the first experiments toward practical results were made in Europe in the latter part of the 18th and early part of the present century. The first machines, however, which attained to much efficiency were made in the United States between 1830 and 1850. The first reaping machine on record was described about A. D. 60 by Pliny, who says that it was used on the plains of Rhætia. It had the form of a cart with a comb-like bar in front, which stripped off the ears of wheat and delivered them into a box, the straw being allowed to stand. It was propelled by an ox that walked behind the machine. A similar implement is now in use for gathering clover seed, called a header. The forerunner of the present form of machines, in which the gatherers or cutters were given increased velocity, was one constructed by Pitt in 1786, in which a cylinder armed with combs plucked off the ears and discharged them into a box. For some time after this the cutters were made upon the rotary principle, the motive power being, as ever since, the bearing wheels. In 1822 a reciprocating or to and fro motion was given to the cutters. Nearly all the inventors attached the power behind, only four previous to 1823 placing it in front. In 1806 Gladstone of England patented a front-draft side-cut machine having a revolving knife. A bar with fingers gathered the standing grain and held it to the knife. Ogle in 1822 made the first reciprocating knife, which was also attached to a forward-draft machine. He used a reel to gather the grain to the cutter, and also a platform which was tilted to drop it in portions. Bell's machine (1826) had a reel and a travelling apron which carried off the grain to one side. The names of Adams of New York, Ten Eyck of New Jersey, and Lane of Maine are among the earliest connected with the invention of harvesters in the United States. In 1833 Obed Hussey, then of Cincinnati, O., patented a machine to which he applied sawtoothed cutters and guards. This machine was at once put into practical operation. On July 12, 1837, a public exhibition of its operation, under the direction of the board of trustees of the Maryland agricultural society for the eastern shore of Maryland, gave great satisfaction. During the same season this machine cut in a satisfactory manner 180 acres of oats and barley on a farm in Maryland. The open-topped slotted finger was patented by Hussey in 1847. In 1834 Cyrus McCormick of Virginia patented a reaper, which, having been improved in 1845 and again in 1847, received a medal at the world's fair in London in 1851. It had a sickle-edged sectional knife, reciprocating by crank movement with the bearing and drive wheels; there was a reel, and a divider was used on each end of the platform. The reaper had a seat behind the platform. The names

of Haines, Ketchum, Manny, and Wood are prominent among inventors of improvements in mowers and harvesters. The practical use of self-rakers in this country dates from the invention of W. H. Seymour of New York in 1851, who arranged a quadrant-shaped platform directly behind the cutters, a reel to gather the grain, and a rake moving over the platform in the arc of a circle, depositing the sheaves on the ground. In 1856 Owen Dorsey of Maryland combined the reel and rake, and his improvement has been extensively used in this country and Europe, with some modifications, one of which was by Johnston in 1865, who arranged it so that the size of the sheaves, or gavels as they are called, could be regulated at the will of the driver.—Owing to the variety in form and the multiplicity of patented modifications of the several parts of the modern machines, and the impossibility of doing justice to all parties in an attempt to describe all the inventions within the limits of this article, we shall give a general description only of their construction and operation. These machines

FIG. 1.—Mower.

consist of a strong framework, so constructed as to support a driver's seat, the cutting mechanism, and, when used for harvesting grain, a platform on which the grain falls when cut, and from which it is raked as often as a sufficient quantity for a bundle has accumulated. This framework is somewhat longer than the width of the swath to be cut, which is usually 5 ft., and of sufficient width for the platform, say 3 ft., except when used for cutting grass, when the platform is dispensed with, as the mown grass is allowed to fall over the cutters directly upon the ground. On the front edge of the frame is the cutting apparatus, consisting of a series of iron guards or pointed fingers, which are permanently fastened to the frame and extend about 7 in. beyond its edge, parallel to each other, horizontal and pointing forward. They are about $3\frac{1}{2}$ in. apart, and $1\frac{1}{2}$ in. wide at the base, lessening toward the point. Each guard has a horizontal mortise through it, and being on a line with each other they all form a continuous horizontal mortise or slit through the whole line of guards. The cutters are

formed of thin triangular plates of steel, fastened to a straight flat rod or plate of metal. These steel plates are arranged side by side, resembling a saw with teeth 3 in. wide at their base and 4 in. long, sharp on both sides, and terminating in a point. This saw or cutting plate is passed through the slits in the guards with the teeth pointing forward and their points coming even with the centres of the guards. One end of the saw is connected with a crank, which receives a rapid motion through intermediate cog wheels, from the tractive force and motion of the main or driving wheel. The framework with all its mechanism is supported by two or more wheels, the drive wheels being much larger than the others, and the axles so constructed as to admit of the platform, cutters, &c., being horizontal and suspended within a few inches of the ground. The pole is so attached to the framework as to allow the team to walk before the machine on the stubble of the last swath, while the platform with the cutters on its front edge extends on the right at right angles with the direction of the horses, so that the guards and cutters are presented to the standing grain or grass. A large reel, in front of and parallel with the series of cutters, is sometimes attached to the framework, and, being connected by a band or otherwise to the drive wheel, is made to revolve with it in the right direction to bend back the top of the standing grain or grass, past the cutters and over the platform, which tends to assist the cutting and to insure the backward fall of the grass upon the platform, or the ground in the rear of the machine. Some of the later machines, like the one shown in fig. 2, of which the "Champion" reaper of Springfield, O., is an example, have a sweep rake consisting of arms which, by means of a circular inclined plane, or stationary cam over which the heels of the arms are made to pass in revolving, become elevated when passing over the inner drive wheel, and lowered to the proper level when passing over the platform, so that the grain is gathered into parcels of a

FIG. 2.—Reaper.

suitable size for sheaves. A seat for the driver is usually attached directly behind the team, above and over the outer drive wheel in the harvester, but in the mower it is usually between the two drive wheels. Some patents have been granted for machines for reaping

and threshing grain at the same operation, and many for a binding apparatus as an attachment to the reaper; but the more simple machines are the ones in general use.

MOXA, a counter-irritant used especially in cases of gout, rheumatism, and nervous disorders. It is of Japanese invention, having been in use in that country many centuries. The term is derived from the Japanese *mogusa*, "burning herb or grass." The finer woolly parts of the young leaves of wormwood, a species of *artemisia*, are applied to the skin in the form of small cones, and set on fire by means of a magnifying glass. They burn very slowly, and leave a scar or blister, which afterward breaks and discharges. The operation is not severely painful, except when it is applied twice in the same place. The Japanese have elaborate treatises on the art of moxa burning, according to the part to which it is applied. Its use in Japan is almost universal, and nearly every person, especially among the lower classes, is scarred with moxa spots, burned on the back to relieve pleurisy, asthma, and indigestion; on the legs for rheumatism and to strengthen the feet; on the arms to relieve sore or weak eyes. It is used occasionally in the practice of western physicians.

MOXOS, or **MOJOS**, a nation of Indians in South America, occupying a large tract in Bolivia, between lat. 13° and 16° S., and lon. 64° and 69° W. They believed that they originated on the spot, and from their superstitious reverence for its mountains, lakes, and rivers, each band feared to emigrate. They are lighter in color and taller than the neighboring nations; are industrious, cultivating the soil, fishing and hunting. The women spin and weave. Their manners are generally mild, though they have some cruel superstitions. Missions were attempted among them at a very early period by the Dominicans, and a great mission of Jesuits was founded by Cyprian Baraza in 1676. They stopped the feuds among the Moxos bands, increased the planting of maize and bananas, and taught them various arts, collecting them in 15 fine missions. The Moxos Christians suffered greatly from the attacks of the Portuguese, who carried off whole villages as slaves, but the suppression of the Jesuits was the greatest blow. They left 30,000 converts, but in less than 20 years the missions were reduced to 11. They have declined still further during the revolutions of the present century. In 1820 Velasco, the governor of the district, killed the cacique of San Pedro, and the Moxos rose in rebellion and put Velasco and his soldiers to death. In 1831 the Moxos missions, with those of the kindred Baures and Muchojeones, numbered only 13,620 souls in all, of whom 1,000 were in a wild state. They have a few books copied from generation to generation, and still play the old church music from notes. Even in their wild state they had a kind of signs which they used in writing. A history of the Moxos was written by F. Francis X.

Iraizos. Their language lacks *d*, *f*, *l*, is harmonious, and abounds in frequentative words. There is an *Arte de la lengua Moxa con su vocabulario*, by Father Marban (Lima, 1701).

MOZAMBIQUE (Port. *Moçambique*). **I.** A name applied to a large extent of the seaboard of E. Africa, belonging to Portugal; area, about 380,000 sq. m.; pop. about 300,000. It is bounded E. by the Mozambique channel, N. by Cape Delgado, lat. 10° 41' S., and S. by Delagoa bay, lat. 26° S.; on the west the boundary is indefinite. The coast includes the two prominent headlands of Cape Corrientes in the south and Cape Delgado in the north, and several large bays, the chief of which are Delagoa and Pamba. Between Delagoa bay and Cape Corrientes, and from Mozambique city to Cape Delgado, the shores are high and precipitous; while reefs and numerous islands lie off the land nearly throughout its entire length. Many large streams discharge themselves here; the principal is the Zambesi, the largest river of E. Africa, which debouches by several mouths at the middle point of the Mozambique coast. The climate is hot and unhealthy. Considerable tracts are cultivated and yield abundant crops of rice. The forests supply wood of great beauty and value. The rivers abound with hippopotami, which yield fine ivory. Gold was formerly obtained by washing the sands, but little is now produced; and copper ore is said to be found in several places. The vast plains of the interior abound in elephants, lions, and other wild animals, from which ivory and valuable skins are obtained. But the Portuguese have so neglected their possessions that the trade and government are now very feeble. The native chiefs are absolute rulers in most parts of the territory, and many of them are inimical to the Portuguese authority, which does not extend ten consecutive miles in any direction. Many of the subordinate officials and the entire garrison of 1,000 men are convicts. The coast for administrative purposes is divided into six sub-districts, of which Mozambique is the head. A governor general and secretary, appointed by the crown, administer the government, assisted by a *junta* composed of a president, treasurer, and 12 members; and it is represented by two members in the Lisbon cortes. The established religion is Roman Catholic, and is superintended by an apostolical prefect and a few priests. Education, like religion, is at a very low ebb, and most of the teachers reside in the capital. The Portuguese settlements, beginning from the north, are São João, Mozambique, Quilimane, Sena, Tete, Sofala, Inhamban, and Lourenço Marques; all of which have declined.—This coast was known to the Arabs centuries before its discovery by Europeans, and was occupied by them when first visited by the Portuguese in the beginning of 1498. The fame of its gold and the convenience of its ports for the Indian trade led the Portuguese to at-

tempt the expulsion of the original settlers. This was not difficult, and in 1508 they had obtained a footing in two places, and built a fort upon the island of Mozambique. They have made some unsuccessful attempts to penetrate the interior; but since 1860 a considerable part of the territory immediately adjacent to the Zambesi, and its tributary the Shire, to Lake Nyassa, has been explored by Dr. Livingstone. The slave trade is still carried on, but not so actively as formerly, and several Portuguese officials have been removed for permitting it or participating in it. In 1873 Sir Bartle Frere visited Mozambique and adjoining countries, and negotiated with the sultan of Zanzibar a treaty for the suppression of the slave traffic on the E. coast of Africa.

II. A city, capital of the territory, on a coral island near the mainland; pop. about 7,000. The centre of the island is in lat. $15^{\circ} 3' S.$, lon. $40^{\circ} 48' E.$ It is about $1\frac{1}{2}$ m. long and $\frac{1}{4}$ m. broad, in the form of a crescent, with the hollow side toward the sea; and, with two

other islets, it is near the mouth of a bay 6 m. long and 5 m. broad, which furnishes a safe and excellent harbor. The ground on which the town stands is from 20 to 50 ft. above the water, and the position is strongly fortified. The governor's palace is an extensive stone building. There are two churches and three chapels, a custom house, a hospital, prisons, tanks, and storehouses. The streets are very narrow, and the houses being all whitewashed, the glare and heat are very great, the mercury rising from 6° to 10° higher in the town than on the mainland. The inhabitants are a mixture of Indian, Arabian, and European, and their costumes are as various as their races. With the exception of the governor and his staff, the greater part of the European settlers are convicts. Other classes are descendants of the old Arab settlers, most of whom are sailors, the Banian traders from Hindostan, and negroes. Mozambique formerly supplied nearly all the markets in that part of the world with slaves, besides sending some to the West Indies.

Mozambique.

The legitimate traffic of the place is principally carried on by Arab ships, which bring piece goods and eastern produce from India, and take back ivory. It was made a free port a few years ago, but the rise of Zanzibar and the almost total suppression of the slave trade have interfered with its prosperity, though its export of ivory is still important.

MOZAMBIQUE CHANNEL, the passage between the E. coast of Africa and the island of Madagascar, lat. 12° to $25^{\circ} S.$ At its S. entrance it is 550 m. wide, at its N. nearly 600, and in the middle about 250. Its length from N. E. to S. W. is about 1,050 m. The Comoro islands lie at its N. entrance.

MOZART. **I.** Johann Georg Leopold, a German musician, born in Augsburg, Nov. 14, 1719, died May 28, 1787. He excelled on the organ when a youth, and paid his way while studying law by teaching music. Having gone to Salzburg to perfect his studies, he accepted the post of chamberlain to Count Thurn, a prebendary of the cathedral. In 1743 Archbishop

Sigismund appointed him chamber musician; a few years later he became court composer and leader of the orchestra, and in 1762 vice chapelmaster. In 1757 his musical works were already very numerous. His "Violin School" (1756), which laid the foundation for modern German violin playing, is remarkable as the first of its kind, and as teaching that mere execution is but a means to the true artistic end. He married in 1747 Anna Maria Pertlin, who bore him seven children, all of whom died in infancy excepting a daughter and a son. The daughter, Maria Anna Walburga Ignatia (born 1751, died 1829), became known as a pianist and afterward as a teacher, and married Baron Berchthold. **II.** Johannes Chrysostomus Wolfgang Amadeus (generally called Wolfgang), a German composer, son of the preceding, born in Salzburg, Jan. 27, 1756, died in Vienna, Dec. 5, 1791. When in his third year he attracted his father's notice by striking chords upon the harpsichord, and by readily learning passages in his sister's music

lessons. In his fourth year his father began to teach him short pieces for the harpsichord. In his fifth year he composed little melodies with simple but correct harmonies, which his father wrote out. Though music was his chief delight, he displayed great aptitude for languages and mathematics. In January, 1762, when Wolfgang was six years old, the elder Mozart took his two children to Munich, where they played before the elector and excited the deepest astonishment. In the autumn they visited Vienna, and were at once summoned to Schönbrunn. In October the boy was seized with the scarlet fever, which interrupted their performances, and after a visit to Presburg they reached home in January, 1763. Mozart at this time played at sight the second violin part in six trios, which one of his father's pupils had written during his absence. Schachtner relates that one day Wolfgang, who was playing his own violin, said to him: "Your violin is tuned half a quarter of a note lower than mine here, if you have left it as it was when I last played it." Schachtner's violin was brought and found to be as Wolfgang had said. This extraordinary memory for pitch afterward became conspicuous in Mozart's performances. In the summer of 1763 another tour was undertaken, extending to Paris and London. The boy most astonished old musicians by his organ playing, and in Heidelberg this was commemorated by an inscription placed upon the organ. After performances before various German princes and in cities, they at length reached Frankfort. The following is an extract from the advertisement of their concert in that city, on Aug. 30: "The girl, now in her 12th, and the boy, in his 8th year, will not only play concertos upon the harpsichord (the girl indeed the most difficult pieces of the greatest masters), but the boy will also perform a concerto upon a violin, accompany in symphonies upon the harpsichord, cover the keys with a cloth and play as well as if they were in sight, and also designate any note or chord struck at a distance, whether upon a harpsichord or any other musical instrument, or upon bells, glasses, musical clocks, &c. Finally, he will extemporize, not only upon the harpsichord, but also upon the organ, so long as any one desires, in all, even the most difficult keys that can be proposed, and thus prove that he understands the organ, which is totally different from the harpsichord in its treatment." After successful performances in Coblenz, Aix-la-Chapelle, and Brussels, they reached Paris in November. Here they won additional fame. Mozart accompanied Italian and French airs at sight, transposing them when required to do so, a task then more difficult than now, as the accompanist had to read the full score or depend upon a figured base. At this time his first work was published, consisting of four sonatas for harpsichord and violin. In April, 1764, the family went to London, where they were received with even

greater enthusiasm than in Paris. The queen accepted the dedication of six sonatas for pianoforte and violin from his pen, and the public crowded the concerts, in which he appeared in the new character of composer of symphonies for the orchestra. They returned through Holland up the Rhine, and through Switzerland to Salzburg, where they arrived in November, 1766. The elder Mozart now put both children to a systematic and thorough study of both instrumental execution and the theory of music. Wolfgang studied with unflagging zeal Emanuel Bach, Hasse, Handel, and the old Italian masters. A German passion cantata and a Latin *comædia*, "Apollo and Hyacinth," attest his progress in contrapuntal study and composition in 1767. The emperor Joseph II. suggested the composition of an opera by young Mozart on the occasion of the marriage of an Austrian princess with King Ferdinand of Naples. An Italian opera buffa, *La finta semplice*, was selected, and Wolfgang was engaged to compose it on the usual terms, 100 ducats. The score was finished soon after Easter. It is still preserved, and is fully up to the standard of similar works of that period, but owing to the intrigues of jealous musicians it was never performed. At the request of Maria Theresa, he composed a mass and conducted it in presence of the empress, Dec. 7, 1768. He also produced an operetta, "Bastien and Bastienne." The pecuniary success of this visit to Vienna was limited, but Mozart's increased fame led the archbishop Sigismund to appoint him concert master. The year 1769 was devoted to severe study. Two masses of this date indicate the pains taken by the father that his son should become a contrapuntist of the severest school, as the foundation for the future practice of free composition. In December of this year his father took him to Italy. Concerts were given in Verona, Mantua, and other places, Wolfgang appearing as singer, composer, and performer on the harpsichord, organ, and violin. His extemporaneous compositions had the greatest weight with musicians, and that of several arias to words from Metastasio displayed so much talent that the composition of an opera for the next winter was offered him under very flattering auspices. In Lodi he composed his first string quartet; and in Rome he reproduced Allegri's *Miserere* from hearing it in the Sistine chapel. Several weeks were next spent in Bologna, where Wolfgang had the advantage of much intercourse with Padre Martini, and where he became a member of the philharmonic society. He went thence to Milan, where he wrote his opera *Mitridate, re di Ponto*. It was finished and rehearsed in less than two months, and on Dec. 26, 1770, successfully given, Wolfgang presiding at the harpsichord. It ran 20 nights, and when he left Milan the score remained behind, to fill orders for five copies. They visited Turin, Padua (where an oratorio was ordered from Wolfgang, prob-

ably the *Betulia liberata*), Vicenza, and Verona, and reached home in March, 1771. Maria Theresa had ordered an opera by Hasse and a serenata by Mozart for the occasion of the marriage of the archduke Ferdinand with a daughter of the prince of Modena, which was to be celebrated in Milan with great splendor. It was September before the text to the serenata, *Ascanio in Alba*, in two acts with ballet, was delivered, and scarcely six weeks were left for the composition and rehearsal of the work; but it was ready in time, and wholly eclipsed Hasse's opera. Just as they reached Salzburg again, Archbishop Sigismund died. His successor, Hieronymus, Count Colloredo, did all in his power to break the spirit, crush the hopes, and ruin the prospects of young Mozart. For the festivities of his installation Mozart was ordered to compose Metastasio's opera, *Il sogno di Scipione*. It was a hasty composition, and bears more marks of being a mere occasional piece than any other of his works. In November he again reached Milan, bringing with him a part of the recitative of an opera which had been ordered, but changes in the text forced him to rewrite most of it. The singers were not yet there for whom he was to adapt the principal parts. It was already December, and only the recitative, choruses, and overture were finished. Yet on the 26th it was publicly given, and, in spite of a bad performance, was a success. It was repeated more than 20 times; but notwithstanding its success it was Mozart's last opera written for the stage in Italy, because Hieronymus henceforth refused his concert master, save in a single instance, leave of absence. In the autumn of 1774 came an order for a comic opera for Munich. Hieronymus stood in such relations to the elector, that he could not refuse Mozart the necessary leave of absence. The fine orchestra and excellent singers were a new spur to the young man, and this effort surpassed all his previous ones. The opera was *La finta giardiniera*, performed Jan. 13, 1775. A visit of Maria Theresa's youngest son, Maximilian, afterward elector of Cologne, to Salzburg, was the occasion of Mozart's last youthful operatic composition; it was Metastasio's *Il repastore*. During the next two years he filled his position as concert master at a court where there was a constant demand upon him as performer and composer. He was the favorite of all classes, and had but one enemy, the man upon whom he depended for subsistence. He was wretchedly paid, and the family avoided debt only by the most rigid economy. Another artistic tour was a necessity, and as a preparation for this Mozart went again through a course of study in perfecting himself as a performer upon the organ, harpsichord, and violin. In the autumn of 1777 the father petitioned for leave of absence for himself and son. The request was rudely refused. Wolfgang, now of age, immediately resigned his place as concert master. He was the first pianist, one of the first

organists, and in the highest rank of violinists in Europe; and the author of more than 200 works, from the opera, grand mass, and symphony, down through all classes of compositions. He first went to Munich with his mother, but there was no vacancy; and he turned his steps to Mannheim, where he could not obtain employment. He stayed till March, 1778, partly in consequence of a passion for a beautiful young singer, Aloysia Weber. The mother and son now tried Paris, where they arrived March 23. The contest between the Gluckists and Piccinists was at its height, and they with the French composers filled the stage. Baron Grimm received the Mozarts with great kindness; but he belonged to the Italian party. He procured Mozart a few pupils, who were his main dependence during his stay in Paris. Le Gros, the conductor of the *concerts spirituels*, and others, were very ready to use the young composer's talents for their own benefit, until he was forced to refuse any application for new music not accompanied by the offer of a reasonable compensation. The spring passed away, and the prospect began to improve. Le Gros ordered a symphony, which was given with the greatest applause. At this time (July 3) Mme. Mozart died, and Mozart's father ordered his return to Salzburg. He felt it to be his duty to obey, although fortune was evidently turning in his favor in Paris. The time spent there had been of great value to him. He had made himself familiar with many of the principal works of the three great schools of opera, Gluck's, the Italian, and the purely French. The coming of Christian Bach from London, and his friendship for Mozart, opened a prospect also in the English capital; the place of organist at Versailles, almost a sinecure, had been proposed for him. He delayed at Munich, where he met the Weber family and found that Aloysia's love for him had grown cold; and he did not reach Salzburg till January, 1779. Mozart was now "concert master and court and cathedral organist;" the salary was small, but, together with that of the father and what he earned by teaching, enabled the family to live in comfort. It was stipulated in the new contract with the archbishop that leave of absence should be granted at reasonable intervals, for the production of new works in other cities. So passed nearly two years, Mozart being called upon continually for new music for church and chamber, and supplying the demand with a succession of works of increasing excellence. Of dramatic music during this period he produced only the choruses and *entr'actes* to the play of "Thamos, King of Egypt," and an unfinished opera, *Zaide*. In 1780 he received the order for *Idomeneo*, the opera seria for the ensuing carnival, which was produced Jan. 29, 1781. Five years had elapsed since his last work for the operatic stage, which had been in the formal Italian style. *Idomeneo* from the character of the text was of the same school, but bears marks of the composer's

studies at Paris, and exhibits proofs of a genius rapidly becoming independent of traditional trammels. It was received with great applause. Mozart had hopes of obtaining a permanent appointment from the elector Charles Theodore, when he received a peremptory order from the archbishop to meet him in Vienna. Mozart and two other musicians in the archbishop's train dined with the two chamberlains and the three head cooks. The archbishop exhibited his concert master both as performer and composer, but took care that he should have no opportunity of playing where he could increase his income; and it was only through the persistency of men whose request Hieronymus dared not refuse that Mozart was permitted to play in the grand annual charitable concert. The impression made by him on this occasion was remarkable even in Vienna. His success is the only known reason why Mozart was ordered to return to Salzburg early in May. An accident caused him to delay a few days, and when he called on his master to excuse himself and take leave, he was received with a torrent of abuse. Remembering the needy circumstances of his father, he had borne the indignities to which he was subjected for six weeks, but he could endure them no longer, and tendered his resignation. The archbishop took no notice of it, and he repeated his application on June 8, upon which Count Arco, "master of the kitchen," grossly abused him and turned him out of the room. Nothing but the remonstrances of the father prevented the son from publicly calling Arco to account. No cause has ever been suggested for the hatred of the archbishop, except that the Mozarts disdained to play the part of flatterers. Mozart now gave lessons and concerts, and published music by subscription. He resided for some months with the Weber family in Vienna, where Aloysia, who had married Lange the actor, was engaged as a singer. The emperor Joseph, who was then busy with his project of establishing an opera devoted to German works, and who was friendly to Mozart, ordered a composition from him. This was the opera "Belmont and Constanza." Mozart received the text in July, 1781, and the music was soon ready; but owing to the opposition of the singers and orchestra, urged on by the Italian faction, the opera was not produced till July 12, 1782, and then only by express command of the emperor. In the mean time Mozart had become enamored of Constanza Weber, sister of Aloysia, and his father, apparently believing the groundless stories respecting their intimacy, gave an unwilling consent to their marriage, which took place Aug. 4, 1782. They had several children, of whom only two survived infancy. The emperor having given up his idea of establishing a German opera, and the Italian school continuing to thwart his progress, Mozart endeavored in 1783 to compete with it by procuring popular texts, but was successful only after his acquaintance with Da

Ponte, who furnished him with the libretto of the "Marriage of Figaro." Beaumarchais's play was just then exciting extraordinary interest in Paris. Mozart saw the capabilities of the subject, and proposed to Da Ponte to make it the theme of an Italian opera text. It was finished in six weeks. At the first performance, May 1, 1786, Mozart was obliged to go to the emperor's box after the first act to inform him that several of the singers were singing false purposely, to prevent his success. The emperor put an end to these intrigues, and none of Mozart's successes was more triumphant. His opponents now plotted in secret to prevent its repetition, and it was given but nine times, when V. Martini's *Cosa rara*, with its light pleasing music, long ago forgotten, met with such a popular reception that the managers withdrew *Figaro* from the stage for the next two years. But in Prague it was received with so much applause that Mozart was induced to visit that city. His stay there was one of the happiest periods of his life, and he consented to prepare a new piece for the manager of the Prague opera, for which Da Ponte wrote his libretto of *Don Giovanni*. It was given first on Oct. 29, 1787, the overture being played without rehearsal from parts just from the pens of the copyists, Mozart not having written it out until the night before. On Nov. 3 it was sung for the fourth time and for the benefit of the composer. Just as Mozart reached Vienna again, Gluck died of apoplexy (Nov. 15), and the emperor, aware that the composer was only awaiting adequate proposals to go to London, at once appointed him one of his chamber musicians, a sinecure with a salary of 800 florins, which, though small, was higher than that of his colleagues. The report of the first performance of *Don Giovanni* had excited a desire in Vienna to hear it. It was performed May 7, 1788, but was coldly received. The emperor said to Da Ponte: "The opera is divine! perhaps finer than *Figaro*; but it is no food for the teeth of my Viennese." Da Ponte repeated this to Mozart. "Let them have time to chew upon it," said he. Da Ponte used his influence to have the performances of it follow each other as rapidly as possible, and the result was an astonishing success, as the audience gradually recognized the transcendent merits of the work. A new sphere of activity now opened for Mozart. Starzer, director of the great oratorio, died, and Mozart was engaged in his stead. In Handel's time the deficiencies of the orchestra were compensated by the organ; but, as the performances in Vienna took place in halls where there was no organ, it was necessary to supply its place with additional orchestral parts. Four of Handel's works were arranged by Mozart: "Acis and Galatea" (1788), "The Messiah" (1789), and "The Ode for St. Cecilia's Day" and "Alexander's Feast" (1790). Although he never worked harder than at this time, his pecuniary condition was becoming deplorable. He was

plundered of his labors by performers, and of his money by delinquent borrowers; but his fame was extending, and his works, notwithstanding their striking originality, were becoming more generally appreciated. In the spring of 1789 he became a travelling companion of Prince Charles Lichnowsky, and he gave performances in Dresden, Leipsic, and Berlin. The king of Prussia, Frederick William II., understood Mozart's music very well, and took such a liking to him as to offer him the place of chapelmaster with 3,000 thalers salary. Mozart refused the offer out of regard for the emperor Joseph, whereupon the king told him it should remain good for a year and a day. After an absence of three months he returned to Vienna, where his profits were soon absorbed by the illness of his wife. He now wrote a quartet for the king of Prussia, for which he received a gold box and 100 friedrichs d'or. He had as yet said nothing of Frederick William's offer; but, urged by his friends, he submitted to the emperor his needy condition and requested his dismissal. Joseph was unpleasantly surprised, and exclaimed: "What! you will leave me, Mozart?" Mozart was touched, and replied: "Your majesty, I throw myself upon your mercy, and will remain." His *Così fan tutte* was produced Jan. 26, 1790, and was running successfully when the emperor died, before he had increased the composer's salary. The new emperor Leopold II., hostile to his predecessor's favorites, declined his services; and he carried his spitefulness so far that when the musicians in Vienna played before the king of Naples, Mozart was not invited to take part. In the autumn he visited Frankfurt, Mentz, and Mannheim, on occasion of Leopold's coronation. In Munich he was invited to play before the king of Naples, upon which he wrote to his wife: "Very honorable to the court at Vienna that the king could only hear me in a foreign land!" He was still pressed for money, but fortune was turning. Soon after his return, John Peter Salomon came to Vienna to engage Haydn, and after him Mozart, for his London concerts. Early in the spring of 1791 an old acquaintance, Schikaneder, proprietor of a small theatre in Vienna, applied to him to compose music for a fairy play. The subject was the *Zauberflöte* ("Magic Flute"). Constanza Mozart was in Baden at the sulphur baths, and her husband while engaged upon this opera was thrown much into the society of Schikaneder, who led a dissipated life. With him and his companions the disappointed and harassed composer forgot his troubles, and for 10 or 12 weeks, the first and only time in his life, was induced to break in upon his abstemious habits. With the exception of those which relate to this short period, the stories unfavorable to his reputation which are current in musical literature are without foundation. On May 9 the magistrates of Vienna appointed Mozart adjunct and successor to the chapelmaster Hoffmann of St. Stephen's church, the

best musical position in Vienna, except the imperial chapelmasterships. In July a messenger unknown to Mozart (his name was Leutger) brought him an anonymous letter in which, after speaking warmly of the composer's genius, his terms for a requiem were demanded. Mozart gave them, and soon after the messenger returned and paid him 50 ducats (or according to some authorities 100) in advance. At this time he was so assiduously engaged on the "Magic Flute" that he could not carry out Da Ponte's suggestion of giving performances in London, and he was moreover suddenly called upon in August to compose an opera for the coronation of the emperor as king of Bohemia at Prague. But four or five weeks remained for the entire labor of composition and rehearsal of this, the *Clemenza di Tito*, one of Metastasio's texts. When they were about to leave for Prague, some one pulled Mme. Mozart's dress as she and her husband were entering the carriage. She turned, and recognized the man who had ordered the requiem. Mozart explained the necessity of the journey, and promised to complete it at once on his return. When he reached Prague but 18 days were left before the opera was to be given. But his pupil Süssmaier was so well acquainted with Mozart's style of composition, that his master could give the score into his hands after the vocal parts were written and the accompaniment sketched, to be filled out. In this manner the work was completed in time; but it was not received as his others had been, partly on account of the character of the libretto, and partly because the subject was scarcely fitted for the excitement of a coronation. The opera afterward became popular. In September Mozart returned to Vienna, sick and disappointed, to divide his time between the "Magic Flute" and the requiem. The opera was performed on the 30th of that month, Mozart directing. The audience remained cold to the end of the first act, but warmed up before the close, and the composer was called before the curtain. Its popularity increased with each performance. It was given 24 times in October alone. There is hardly another instance in the annals of the lyric stage where an opera possessed of so little dramatic action has become so universally popular. That Goethe wrote a second part to it is perhaps the greatest compliment that could be paid it. Mozart now applied himself to the composition of the requiem with all the force of his genius. He was unable to discover the name (a Count Walsegg) of him who had ordered it, and he began to fancy that there was something supernatural about it. The anxieties of the preceding year, possibly the change in his habits while under the influence of Schikaneder, and his labors on the "Titus," had brought his nervous system into a condition which required a long period of rest. But he persisted in work, although he fainted repeatedly while engaged on the "Magic Flute;" and the restless energy with which he labored

on the requiem daily enfeebled him. His wife became anxious, called a physician, and took away the score. He then imagined that some one had given him poison. In November he was so much better as to write a cantata for the masonic lodge to which he belonged, "Praise of Friendship;" but at this time a rheumatic inflammatory fever was epidemic in Vienna, and in Mozart's enfeebled condition it seized upon him. Inflammation of the lungs led to dropsy of the chest, and after two weeks' confinement to his bed he died. On the last day of his life he busied himself with the requiem, which he fancied he was composing for his own obsequies, but left it unfinished. The widow could not return the money which had been received for it, and she determined to have it completed from her husband's rough notes. Süssmaier, Mozart's pupil, had often conversed with him about the plan of the work, and as his hand had a remarkable similarity to that of his master, he undertook the task. He copied all that Mozart had written, and added the rest, consisting of the close of the *Lacrimosa*, the *Sanctus*, the *Benedictus*, and the *Agnus Dei*, save that to the words *Cum sanctis* he repeated the fugue of the *Kyrie*. When the messenger came for the requiem, this score was given him; and its authenticity as a manuscript from Mozart's hand was never suspected by Walsegg until it began to be discussed by the press. While Mozart lay sick, the Hungarian nobility secured to him an annual pension of 1,000 florins, and a musical association in Amsterdam a still higher annuity, for which he was to furnish certain compositions annually.—Mozart left more than 800 works for the pianoforte in all forms, variations on a simple theme, works for two pianofortes, and up through all gradations to the concerto, with full orchestra; for orchestral instruments of every kind, from solos to the grand symphony; there are even compositions for Franklin's harmonica, and a piece for a musical clock. Equally universal is he in vocal music, from songs and airs for every kind of voice, to the opera and church music in all its forms as employed in the Roman Catholic service. But it is not so much the quantity as the excellence of his music which excites the astonishment of the musician. This was owing not more to the greatness of his genius than to his profound studies, which from infancy to the close of his life never ceased. During the rehearsals of *Don Giovanni* at Prague, in a conversation with the chapelmaster Kucharz, he remarked, in reply to praises of the new work: "People err if they think my art has cost me no trouble; I assure you, my dear friend, no one has taken such pains with the study of composition as I. There is hardly a celebrated master in music whom I have not carefully, and in many cases several times, studied through." Several generations of musicians have been educated upon the works of Mozart. His ideas have become common stock; and effects which, if now introduced

into a composition, would sound hackneyed, were in his works the joint production of lofty genius and profound contrapuntal knowledge, guided and restrained by exquisite taste. As an instrumental composer perhaps one only has surpassed him, Beethoven; but Beethoven had perfected his genius by studying Mozart. Haydn had developed the quartet form and invented the grand symphony. Mozart gave them a new spirit, and one sees his influence in all Haydn's later works. That great master said to Mozart's father in 1785: "I tell you before God and as a man of honor, that I look upon your son as the greatest composer of whom I ever heard; he has taste, and possesses the most thorough knowledge of composition." The symphony in C with the fugue is alone sufficient proof of the correctness of Haydn's opinion; it is the greatest work of the kind ever written before Beethoven. But it was as an operatic composer that Mozart reached a height upon which, like Handel in oratorio, and Bach in his own contrapuntal sphere, and Beethoven in orchestral music, he stands superior to all his predecessors. Two musical institutions bear his name, the Mozarteum at Salzburg, and the Mozartstiftung in Frankfurt, and a monument was erected to him in the former city in 1852.—Among German works relating to Mozart are those by Niemetschek (1798), Röchlitz (1801), Arnold (1803), Nissen (1828), and Otto Jahn (4 vols., 1856-'9; new ed., 2 vols., 1869), the last of which is considered the best. The best French works on Mozart are by Fétis and Scudo. Several of the German works have been translated into French, and a publication in French by the Russian Ulibisheff (Moscow, 1841) has been translated into German (new ed. by Prof. Santler, 3 vols., 1873). In English, E. Holmes published a "Life of Mozart" (2 vols., London, 1865). Mozart's letters, edited by Nohl (1865; new ed., 1870), have been translated into English by Lady Wallace (2 vols., London, 1865). The earliest notice of Mozart in any language is by Daines Barrington in the "Philosophical Transactions" (1770). In 1874 the house in which Mozart composed the "Magic Flute" was removed to the Mirabellgarten in Salzburg, to be a repository of portraits and autographs of his eminent contemporaries and of musicians and poets of the present day.—KARL, the last surviving son of Mozart, attended the centennial celebration of his father's birth at Salzburg in 1856, and died in Milan, Oct. 31, 1858, leaving a large fortune.

MOZIER, Joseph, an American sculptor, born in Burlington, Vt., Aug. 22, 1812, died in Switzerland in October, 1870. He removed to New York in 1831, and was engaged in mercantile pursuits till 1845, when he retired from business, and shortly after visited Europe. Having devoted several years to the study of sculpture in Florence, he went to Rome, where he long resided. His principal works are a statue of Pocahontas, the "Wept of the Wish-ton-Wish," contributed to the in-

ternational exhibition at London in 1862, statues of "Truth" and "Silence" in the possession of the New York mercantile library association, "Rebecca at the Well," "Esther," a group illustrating the parable of the prodigal son, an "Indian Girl at the Grave of her Lover," and "Jephthah's Daughter."

MOZLEY, James Bowling, an English clergyman, born in Lincolnshire in 1813, died Jan. 4, 1878. He graduated at Oriel college, Oxford, in 1834, was elected fellow of Magdalen college, and became vicar of Shoreham, Sussex, in 1856. He was appointed Bampton lecturer in 1865, canon of Worcester in 1869, and regius professor of divinity and canon of Christ church, Oxford, in 1871. He published "A Treatise on the Augustinian Doctrine of Predestination" (1855); "Primitive Doctrine of Baptismal Regeneration" (1856); "Review of the Baptistical Controversy" (1862); "On Subscription to the Articles" (1863); and "On Miracles" (Bampton lectures, 3d ed., 1872).

MTZENSK, or **Mzensk**, a town of Russia, in the government and 35 m. N. E. of the city of Orel, on the Zusha; pop. in 1872, 13,373. It is the capital of a circle, contains 13 churches and two convents, and has a considerable trade in agricultural products.

MUCUS SÆVOLÆ. See **SÆVOLÆ**.

MÜCKE, Heinrich Karl Anton, a German painter, born in Breslau, April 9, 1806. He completed his studies in Berlin under Schadow, whom he accompanied to Düsseldorf, where he became in 1844 teacher of anatomy at the academy. In 1849 he was appointed professor and subsequently member of the academical senate, which offices he resigned in 1867. He visited Italy and England, and was employed in painting in the former country, and on designs for the "Art Journal" in the latter. Among his principal works are frescoes in the palace of Heltorf, near Düsseldorf, illustrating the life of Frederick Barbarossa, with Lessing and other artists; and a large fresco in St. Andrew's church at Düsseldorf. His fine frescoes for the Elberfeld town hall have been destroyed. Among his most celebrated oil paintings is "St. Catharine carried by Angels to Mount Sinai." His other works include "The Storming of Jerusalem by Godfrey of Bouillon," "The Crowning of the Virgin," "The Resurrection," and many etchings and designs for illustrated works.

MUCOUS MEMBRANE. See **MEMBRANE**.

MUCUS, a transparent, colorless, and glairy or viscid fluid, exuded upon the free surface of the mucous membranes of the living body. It is the secretion of the numerous glandulæ or follicles with which these membranes are provided, and varies in the details of its composition and the degree of its viscosity with the particular region in which it is produced and the special function which it is destined to perform. It does not readily mix with water, but when agitated with that liquid is broken up into floating shreds or flakes, which are apt to become frothy from the entanglement of bub-

bles of air. It consists of water combined with a small quantity of the mineral salts, and a peculiar variety of animal or organic matter termed mucosine; to this last ingredient the glairy or viscid consistency of mucus is mainly due. The office of mucus is to lubricate the mucous canals and thus facilitate the passage of their contents, as in the mouth, œsophagus, and genito-urinary passages; to protect their surfaces from injury by desiccation, as in the nares, trachea, and bronchial tubes; or to take part in the chemical changes going on in their cavities, as in the small intestine. In the cervix uteri, during gestation, the mucus has so great a degree of viscosity as to be semi-solid like gum or strong paste; its office is to block up the cavity of the cervix uteri and prevent the escape or injury of the fœtus.

MUD EEL. See **SIREN**.

MUD FISH (*amia*, Linn.), a genus of American ganoids, found in the fresh waters of the United States. After it had been referred by ichthyologists to cyprinoid, salmonoid, and clupeoid fishes, Vogt discovered it to be a ganoid, having found in the muscular arterial trunk two oblique rows of five or six valves each and a spiral intestinal valve. Müller considers it the living representative of a ganoid family, like the fossil *megalurus*, *leptolepis*, and their congeners. The body is long and flexible, with a bony vertebral column; there are no spiny plates on the anterior border of the fins as in the gar fish, nor a series of separate dorsal fins as in *polypterus*; the mouth is trout-like, except in the absence of lingual teeth; there are two nasal cirri; the head is flat, and the bones under the very thin skin are sculptured plates; the large sublingual bone is naked and furrowed, the gill openings large, and the branchiostegal rays broad and flat, 11 or 12; tongue thick and fleshy; behind the conical teeth of the jaws are flat pavement-like ones; the scales are horny rather than osseous, flexible and rounded, yet presenting bone corpuscles of the same form and character as *lepidosteus* and other ganoids; the ventral fins are median, the single dorsal long, and the anal short; the

Western Mud Fish (*Amia occidentalis*).

caudal comes further forward above than below, rounded, giving an indication of the heterocercal tail. The larger air bladder is cellular and lung-like, communicating with the

cesophagus; no pancreatic cæca; ova dropping into abdominal cavity. Of about ten species, the best known is the western mud fish (*A. occidentalis*, De Kay), from 1½ to 3 ft. long; the back of the head is bluish black, the sides often obscurely spotted with olive, white below, and with a black spot at the upper edge of the caudal. It is found in the great northern lakes, south to Carolina, and west to the Mississippi; it is the bowfin of Lake Champlain, the dog fish of Lake Erie, and the marsh fish of the Canadians; it feeds on crawfish and other crustaceans, and is sometimes eaten by the Indians. This may include several species.

MUD HEN. See *Coor*.

MUDIE, Robert, a British author, born in Forfarshire, Scotland, in 1777, died in London in 1842. He was self-educated, and in 1802 was appointed professor of Gaelic and teacher of drawing in the Inverness academy. In 1820 he went to London, and was employed as a reporter on the "Morning Chronicle," but his career ended unhappily. He published a great number of popular works on natural history, astronomy, and other subjects, including "The British Naturalist" (2 vols., 1835), "Man, Social, Intellectual, Moral, Physical," "Hampshire," &c.

MUEZZIN (Arab. *mueddzin*, caller, proclaimer), an officer of a mosque who calls the faithful to prayer, as prescribed in the Koran, at dawn, near noon, in the afternoon, a little after sunset, and at nightfall, generally about an hour and a quarter after sunset. He stands upon the balcony of a minaret, and turning successively toward the four cardinal points chants in a loud voice: "God is great; I testify that there is no God but Allah; I testify that Mohammed is the prophet of God. Come to prayer; come to the temple of safety. God is great. There is no God but Allah." For the convenience of those who may desire to perform extra devotions, the muezzin chants the same words during the night, and at these times, immediately after the words "come to the temple of safety," he adds: "Prayer is better than sleep." According to an Arabic tradition, the office was instituted by Mohammed himself, and the words last quoted were added to the regular formula by the first muezzin on an occasion when the prophet overslept himself. Mohammed approved of them, and they were ever afterward retained in the nightly call. As the lofty position of the muezzin enables him to overlook the roofs and balconies of the neighboring private houses, on which the women often pass their time, it has long been the custom to confer the office only on blind men; and stories abound in the East of men feigning blindness in order to secure it. Purity of morals, acquaintance with the Koran, and a strong and pleasant voice are also regarded as indispensable qualifications.

MUFTI (Arab., one who expounds the law), a doctor of the law of the Koran who performs certain religious and civil functions. There is

one in every large town of the Ottoman empire. In his religious capacity he manages the property of the church and watches over the due observance and preservation of its rites and discipline. In his civil capacity he pronounces decisions in such matters of dispute as may be submitted to him. He has no power to enforce his decision, but if it is not voluntarily conformed to by the parties, it has great weight before any other tribunal to which they may appeal. Matters of police, disputes between families, and generally questions involving private interests of no great importance, are decided by the mufti without the intervention of advocates or any legal expense. According to tradition, his decisions should be given in the fewest words without assigning any reasons; if possible, it should be simply "Yea" or "Nay." The mufti of Constantinople, or grand mufti, called also *sheikh ul-Islam*, "chief of Islam," is the highest religious authority of the empire. He is appointed by the sultan and can be deposed by him, but the sultan cannot sentence the grand mufti to death nor confiscate his property. The grand mufti ranks next to the grand vizier; he is the chief interpreter of the law, and his authority and influence, though merely advisory, were formerly very great. Of late years the practical importance of the office has greatly declined.

MÜGGE, Theodor, a German author, born in Berlin, Nov. 8, 1806, died there, Feb. 18, 1861. He abandoned commercial life to enlist in the army, and was about to join Bolivar in Peru when the news of the expulsion of the Spaniards reached him in London. He then studied in the university of Berlin, published *Bilder aus dem Leben* (1829), and after losing by his political pamphlets in 1830 all chance of receiving a public office, he began to publish tales, novels, and narratives of travel. A complete edition of his works appeared in 23 volumes in 1862-'7. The most notable are: *Toussaint Louverture* (1840); *Die Schweiz* (1847; English translation by Mrs. Percy Sinnet, London, 1848); and his novels delineating Scandinavian life, *Afraja* (1854; English translation by Edward Joy Morris, Philadelphia, 1854; French, Paris, 1857), *Erich Randal* (1857), and *Leben und Lieben in Norwegen* (1858).

MUGGLETON, Ludowick, an English fanatic, who in conjunction with John Reeve founded the sect of the Muggletonians, born in 1609, died March 14, 1697. He was a tailor, and in 1651 proclaimed himself and Reeve the "two last witnesses" mentioned in the Apocalypse, and armed with power to prophesy and to punish men. Muggleton professed to be the "mouth" of Reeve, as Aaron was of Moses. They began their mission by denouncing all religious sects, especially Ranters and Quakers. In 1656 appeared an exposition of their doctrines under the title of "The Divine Looking Glass." They held that God has the body of a man, that there is no distinction of persons in the Trinity, and that God, descending to earth

and suffering on the cross, left Elias as his vicergerent in heaven during his absence. They were attacked by William Penn in a book called "The New Witnesses proved Old Heretics." Muggleton was arraigned at the Old Bailey for blasphemy in 1676. The first complete edition of his works was published in 1756. In 1832 another edition appeared in 3 vols. 4to, including his rhapsodies and those of Reeve, with several tracts by others.

MÜHLBACH, Luise. See MUNDT, KLARA.

MÜHLBERG, a town of Prussia, in the province of Saxony, on the right bank of the Elbe, 40 m. S. E. of Wittenberg; pop. about 3,500. It is memorable for the victory obtained here, April 24, 1547, by the emperor Charles V. over the elector of Saxony, John Frederick, which terminated the war of the Smalcald league, the elector himself being taken prisoner. The Protestant cause in Germany was completely prostrated, but the fruits of his victory were lost to the emperor by the defection in 1552 of Maurice, the new elector of Saxony.

MÜHLDORF, Battle of. See AMPFING.

MUHLBERG. I. Peter John Gabriel, an American general, son of Henry Melchior Muhlenberg, the founder of the German Lutheran church in America, born at Trappe, Montgomery co., Pa., Oct. 1, 1746, died near Philadelphia, Oct. 1, 1807. He was ordained to the ministry in England, and preached at Woodstock, Va. His last sermon was upon the duties men owe to their country; and saying, "There is a time for all things, a time to preach and a time to fight, and now is the time to fight," he stripped off his gown after the service, put on a uniform, read his commission as colonel, and formed a regiment among his parishioners. He was made brigadier general in 1777, and major general at the close of the revolution. After the war he removed to Pennsylvania, where he was elected a member of the supreme executive council, and in 1785 became vice president of the commonwealth. He was a member of congress in 1789-91, 1793-5, and 1799-1801. In 1801 he was elected United States senator, but resigned the next year, and was appointed supervisor of the revenue for the district of Pennsylvania. From 1803 till his death he was collector of the port of Philadelphia. His life has been written by H. A. Muhlenberg (Philadelphia, 1849). **II. Gotthilf Henry Ernst**, an American clergyman and botanist, brother of the preceding, born in New Providence, Montgomery co., Pa., Nov. 17, 1753, died in Lancaster, May 23, 1815. At the age of 10 he was sent to the university of Halle. In 1770 he returned to America, and in 1774 became assistant to his father, then pastor of the Lutheran congregation in Philadelphia. In 1780 he became pastor of the church at Lancaster. He was a member of the American philosophical society, of the *Gesellschaft naturforschender Freunde* in Berlin, of the philosophical and physical societies of Göttingen, and of various

other associations in Germany and Sweden. His chief works are: *Catalogus Plantarum Americae Septentrionalis* (Lancaster, 1813), and *Descriptio Ueberior Graminum*, &c. (1817). **III. William Augustus**, an American clergyman, great-grandson of Henry Melchior Muhlenberg, born in Philadelphia, Sept. 16, 1796, died in New York, April 8, 1877. He graduated at the university of Pennsylvania in 1814, was ordained in the Protestant Episcopal church in 1817, and became assistant in Christ's church, of which Bishop White was rector. In 1821 he accepted the rectorship of St. James's church, Lancaster, where he was instrumental in establishing the first public school in the state out of Philadelphia. He founded in 1828 a school at Flushing, L. I., which was afterward known as St. Paul's college, and for nearly 20 years was its principal. In 1846 he became rector of the church of the Holy Communion, New York, which was erected by his sister, and was the earliest free Episcopal church. Not long afterward he began his efforts to secure the founding of St. Luke's hospital, which was erected in Fifth avenue and 54th street, and opened in 1858, Dr. Muhlenberg becoming its first pastor and superintendent, which post he still holds (1875). In 1845 he organized the first Protestant sisterhood in the United States, and the ladies of this association are in charge of St. Luke's hospital. He has also, within the past few years, made an effective beginning toward establishing an industrial Christian settlement at St. Johnland, Long Island, about 45 m. from New York. He is the author of the well known hymn, "I would not live alway," and of other poems, has published "Church Poetry, being Portions of the Psalms in Verse and Hymns suited to the Festivals and Fasts, from various authors" (1823); in conjunction with Bishop Wainwright, "Music of the Church" (1852); and "The People's Psalter" (1858). He originated the famous memorial movement in the Episcopal church, and has written much on evangelical catholic union.

MUHLBURG, a W. county of Kentucky, bounded N. E. by Green river and W. by Pond river, its principal branch; area, 430 sq. m.; pop. in 1870, 12,638, of whom 1,633 were colored. The surface is hilly and the soil generally fertile. It contains coal and iron mines near Green river. The Elizabethtown and Paducah railroad passes through it. The chief productions in 1870 were 36,544 bushels of wheat, 364,513 of Indian corn, 86,880 of oats, 1,821,988 lbs. of tobacco, 27,091 of wool, 76,389 of butter, and 2,615 tons of hay. There were 2,985 horses, 1,290 mules and asses, 2,961 milch cows, 4,024 other cattle, 13,959 sheep, and 17,830 swine. Capital, Greenville.

MÜHLHAUSEN, or *Mülhausen* (Fr. *Mulhouse*), a town of the German Reichsland of Alsace-Lorraine, in the district of Upper Alsace, on the Ill, 19 m. N. W. of Basel and 62 m. S. S. W. of Strasburg; pop. in 1871, 52,825, since which it

has considerably increased by immigration from Germany. It consists of an old and a new town, the former on an island, the latter on the right bank of the Ill. Since the beginning of the present century it has been an important seat of industry. Cotton printing was introduced here about the middle of the 18th century, and is largely carried on; and recently the manufacture of woollen goods has assumed great importance. The town with its territory once formed part of the Swiss confederation, but was united to France in 1798. It was occupied by the Germans in September, 1870, and by the treaty of May, 1871, was ceded to Germany.

MÜHLHAUSEN, a town of Prussia, in the province of Saxony, on the Unstrutt, 29 m. N. W. of Erfurt; pop. in 1871, 19,516. It has a gymnasium, 14 churches, three hospitals, and an orphan asylum. The principal manufactures are linens, woollens, leather, and tobacco. It is surrounded by walls, and was formerly a free city of the empire. It is memorable as the headquarters of Münzer, the leader of the peasants' war, and the scene of his execution in 1525.

MÜHLHEIM-ON-THE-RHINE, a town of Rhenish Prussia, on the Cologne and Minden railway, 2 m. N. of Cologne; pop. in 1871, 13,511. It has a Catholic and two Protestant churches, a synagogue and a pro-gymnasium. The industry is very flourishing; the chief manufactures are velvet, silk, and leather. There are also numerous mills, and a brisk trade by river and railway. Its prosperity dates from the beginning of the 17th century, when some Protestant emigrants from Cologne settled here.

MÜHLHEIM-ON-THE-RUHR, a town of Rhenish Prussia, 35 m. N. of Cologne; pop. in 1871, 14,267. It has a Catholic and a Protestant church, a *Realschule*, and a school of weaving. There are important manufactories of woollen and linen cloth, of paper, tobacco, soap, and starch, and a large cotton mill. Many vessels are built here for the navigation of the Rhine and the Ruhr, which here becomes navigable and is crossed by a chain bridge. An important trade is carried on in coal, large quantities of which are shipped to Holland, and in building materials.

MUIR, John, a British orientalist, born in Glasgow in 1810. He was educated in the university of Glasgow and in the school of the East India company at Haileybury, and was employed in the civil service in British India from 1828 to 1853. He gave £5,000 to the university of Edinburgh for the endowment of a chair of Sanskrit and comparative philology, and has greatly promoted the diffusion of Christianity among the Hindoos. His principal work is "Original Sanskrit Texts on the Origin and History of the People of India, their Religion and Institutions" (5 vols., London, 1858-'70).—His brother, Sir **WILLIAM MUIR** (born in 1819), became governor of the North-western Provinces of India in 1868.

MULATTO. See **NEGRO**.

MULBERRY, a name, the derivation of which is obscurely traced to *morus*, the Latin name of a genus of trees which some botanists place in a division of the nettle family (*urticaceæ*), while others make an order *moreæ* for this, the fig, the breadfruit, and a few other related genera. The mulberries are trees with rounded leaves, a milky juice, and monœcious or diœcious flowers in small axillary spikes; the flowers are apetalous, the sterile consisting of a four-parted calyx and four stamens; the fertile with a similar calyx and a two-celled ovary with two styles; in ripening, one of the cells of the ovary disappears, and the fruit proper is one-seeded; it is surrounded by the calyx, which in ripening becomes fleshy and berry-like, and the whole fertile spike, crowded with the ripened calices, becomes edible.—The red mulberry (*M. rubra*) is found from New England southward; it is usually a small tree 15 to 30 ft. high, but in some localities it reaches 60 or 70 ft., forming a handsome head; its leaves are heart-ovate, serrate, rough above, downy beneath, and on young shoots often lobed; the flowers are frequently diœcious; the fruit is about an inch long, dark purple, and pleasant to the taste. This native species has been singularly neglected; it is a handsome ornamental tree, and produces an acceptable fruit, which, to judge from what has been done with other species, may be greatly improved; but its chief value is in the excellent quality of its timber, which is of a yellowish color, strong, compact, and regarded as equal in durability to that of the locust; it is used in ship building as a substitute for locust in treenails, and for the light timbers of vessels and boats, for which use it is in the southern

Black Mulberry (*Morus nigra*).

states preferred to any wood except the red cedar.—The black mulberry (*M. nigra*), probably originally from Persia, has been known from very early times, and it is believed that

the mulberry mentioned in the Scriptures was this species; it has long been cultivated in England, as it is mentioned by Tusser in 1557; Shakespeare had a favorite tree of this species in his garden at Stratford, and from this Garrick raised two trees which were standing a few years ago. There are several instances recorded of the longevity of this tree; those at Syon House, the residence of the duke of Northumberland, can be traced back more than three centuries. Not only is the tree long-lived, but exceedingly tenacious of life; it is stated in the *Annales des sciences naturelles* that a root sent up shoots after lying dormant in the ground for 24 years. This species is not hardy in a climate more severe than that of the city of New York. It seldom grows more than 30 ft. high, is much branched, and has heart-shaped, rough leaves; its fruit is much larger and finer than that of our native species, being an inch and a half long and an inch thick; when ripe the fruit falls spontaneously, and it is customary to plant the tree in grass so that the fruit may be kept clean; the seeds of cress or other fine-leaved annuals are sown around the tree when it stands in bare ground, to form a mat to receive the fruit. In England the mulberry is a popular dessert fruit, and it is used to form a sweetmeat and a sirup; its juice is mixed with that of apples to form mulberry cider. The wood of this species is of little value except for fuel.—The white mulberry (*M. alba*) is a native of China, and has become naturalized in the older portions of this country. It is readily distinguished by its obliquely heart-shaped, somewhat lobed leaves, which are smooth and shining, and by its generally yellowish white fruit, which is mawkishly sweet and without flavor. While silkworms will feed upon the leaves of other species, none produce silk of so fine quality as those kept upon the leaves of the white mulberry. This species was introduced into Europe by the way of the Levant in 1434. The variety of this, with smaller stems and more abundant leaves, called *M. alba multicaulis*, is preferred in the silk-growing countries to any other. The remarkable excitement caused by the introduction of this variety into the United States 30 or 40 years ago is still within the recollection of many; hundreds of people were engaged in raising mulberry trees for sale, with the expectation of a handsome fortune; but as unfortunately there were no buyers, the speculation subsided as suddenly as it arose. A seedling of the multicaulis is Downing's ever-bearing mulberry, which originated with Mr. Charles Downing at Newburgh, N. Y.; the tree is very productive and remains in bearing a long time; the fruit is nearly as large as that of the black mulberry, which it resembles in flavor; it is maroon-colored or blue-black at maturity. Although the fruit of the multicaulis is white, it has produced several dark-colored seedlings besides this. Hicks's ever-bearing mulberry, which originated in

Kentucky, produces an immense quantity of sweet and insipid fruit for four months; in the southern states it is planted in poultry yards to afford the fowls both shade and food.

Paper Mulberry (*Broussonetia papyrifera*).

—The paper mulberry belongs to another genus of the same family, *Broussonetia*, named in honor of a French naturalist, Broussonet; three species have been described, but they are probably all forms of one, *B. papyrifera*, which grows wild in Japan, China, and many of the islands of the Pacific. It is a small quick-growing tree, 20 or 30 ft. high, with leaves very variable in shape; upon the older branches they are ovate or heart-shaped, but those upon vigorous shoots, or suckers that spring up from the roots, are so much lobed and cut that one would hardly think they could belong to the same tree with the others; they are all rough above and downy beneath. This species is truly dioecious, the staminate trees being much more numerous than the fertile; the sterile flowers are in cylindrical catkins much like those of the mulberry, while the fertile are crowded in a round head about the size of a marble; they consist of a three- or four-lobed calyx, out of which the ripened ovary protrudes as a club-shaped, pulpy fruit, which is scarlet, sweetish, and insipid. This has long been cultivated in New York and southward as a shade tree, but elsewhere than in paved streets it becomes a nuisance on account of the great abundance of suckers it produces. It is fortunate that the fruit-bearing trees are rare, as in streets the abundant pulpy fruits fall and keep the walk in an unpleasant condition. The Japanese cultivate this tree to furnish material for their paper; the tree is kept cut back to produce an abundance of young shoots; these, in pieces of convenient size, are boiled to separate the bark, which is then peeled off and dried for use. The bark is converted into paper by

scraping off all extraneous matter, and boiling in ley until its fibres separate; it is then beaten with wooden sticks, and the pulp thus obtained is mixed with mucilage and spread upon frames of rushes to dry. The so-called India paper, used by engravers to take proofs of their work, is also prepared from this bark. In the South sea islands the bark is used to make tapa, which serves the natives as a substitute for cloth; the bark is soaked for a long time and then beaten to the requisite thinness by the use of a square stick of hard wood, the sides of which are sharply creased; the cloth, which is made into garments, is used plain or stamped with rude figures in various colors. The tree is propagated from cuttings made of the root.—Mulberries are propagated by seeds, cuttings, and layers; they grow readily from seeds which are sown in early spring. The black mulberry is grown from cuttings, the multicaulis variety by both cuttings and layers. Downing's ever-bearing is propagated by grafting upon roots of the white mulberry.

MULDER, Gerardus Johannes, a Dutch chemist, born in Utrecht, Dec. 27, 1802. He studied at the university of Utrecht, and became a physician in Amsterdam. In 1827 he was appointed lecturer on botany and chemistry in the medical school of Rotterdam, resigned in 1830, and in 1840 became professor of chemistry at Utrecht. His chief work, translated from the Dutch into German by Kolbe, and into English by Fromberg, is "Chemistry of Vegetable and Animal Physiology" (edited by J. F. W. Johnston, Edinburgh, 1849). In this he deduces as the result of original inquiries the existence in animals of a substance which he calls "proteine," which they derive ready formed from plants. This discovery involved Mulder in a controversy with Liebig, who from the difficulty of obtaining it doubted the existence of proteine as an independent compound. Among his other works are "Chemical Researches" (1847), "The Chemistry of Wine" (edited by H. Bence Jones, London, 1857), "The Chemistry of Beer" (1856), and "The Chemistry of the Vegetable Mould" (3 vols., 1861-'4), all of which have been translated into German.

MULE. See Ass.

MULE DEER. See DEER.

MULGRAVE, I. Constantine John Phipps, lord, a British navigator, born May 30, 1744, died in Liège, Belgium, Oct. 10, 1792. His father was raised to the Irish peerage as Baron Mulgrave in 1767. He early entered the navy, commanded a northeast arctic exploring expedition in 1773, and returned the same year, having reached lat. 80° 48', beyond which an impenetrable field of ice stretched as far as could be seen. He was afterward commissioner of the admiralty, and in 1790 was created Baron Mulgrave in the British peerage. He published a "Journal of a Voyage toward the North Pole" (London, 1774).

II. Henry Phipps, first earl of Mulgrave and

Viscount Normanby, brother of the preceding, born Feb. 14, 1755, died April 7, 1831. He served in the British army during the American war of independence. On his brother's death the English barony became extinct; but he succeeded to the Irish title, became a member of Mr. Pitt's administration, and was noted for his opposition to Roman Catholic emancipation. In 1807 he was made first lord of the admiralty, and in 1812 was created earl of Mulgrave and Viscount Normanby. (See NORMANBY.)

MULGRAVE, John Sheffield, earl of. See BUCKINGHAM, or BUCKINGHAMSHIRE, DUKE OF.

MULGRAVE (or Mille) ISLANDS, a group in the southern part of the Radack chain, which forms the eastern part of the Marshall or Mulgrave archipelago in the N. Pacific ocean. Their extent is not very well determined, but the surrounding reefs have been examined for about 40 m., and only one pass for ships and another for boats could be found. Some of the islands are mere coral rocks submerged at high tide, but nearly all have deep water close to the reefs. When they reach the level of the water they become, like the islands already formed, covered with sand and vegetation. Some of them are of considerable size, and have clumps of coconut and breadfruit trees.

MULHOUSE. See MÜHLHAUSEN.

MULL, an island of the Hebrides, forming part of Argyleshire, Scotland, in the Atlantic ocean, and separated from the mainland by a narrow strait called the sound of Mull; area (including that of the surrounding islets), 301 sq. m.; pop. in 1871, 5,947. The coast is rocky, and deeply indented. The surface is mountainous, Benmore, its highest summit, attaining an altitude of 3,168 ft. The most remarkable natural objects are the caverns and basaltic columns and arches around its shores. The soil is chiefly devoted to pasturage. Herring and white fish are caught off the coasts. Mull contains several villages. Tobermory, near the N. E. extremity, is the most important.

MULLEIN, the common name of *verbascum thapsus*, said to be derived from the Latin *malandrium*, a disease like leprosy, applied to this plant on account of its having been used for this and similar diseases in cattle. It is a common and troublesome plant in cultivated grounds and by roadsides in the older parts of the United States. The genus includes more than 80 species, which are widely distributed; it belongs to the family of figworts or *scrophulariaceæ*, and differs from most others of the family in having an open, wheel-shaped corolla. The common mullein is a biennial with radical leaves 6 to 12 in. long, oblong-acute, those of the stem smaller and decurrent at the base, forming wings upon the stem; the leaves and the stem, which is 4 to 6 ft. high, are clothed with a dense woolly pubescence, which gives the plant a hoary appearance; the flowers are collected in a dense spike, a foot or more long, the bright yellow corolla nearly equally five-

lobed; stamens five, the upper three with bearded filaments; the fruit a thick, ovoid, two-celled capsule, containing numerous small seeds. The plant is found all over Europe and

Common Mullein (*Verbascum thapsus*).

the temperate parts of Asia, and has long been naturalized in this country. Were it not a weed, the mullein would be valued as an ornamental plant, as a single well grown specimen is a stately object; but its chief importance is as a weed, and its presence indicates slovenly culture. Although it so abundantly seeds the ground, it is not difficult to eradicate if taken while young. The leaves have a mucilaginous and bitter taste, and slight narcotic properties, and have long been used in domestic medicine to allay coughs and other irritations, and externally as an emollient application to tumors, piles, &c.; on account of its use in diseases of cattle, one of its common names in England is bullock's lungwort. The down upon the leaves, when perfectly dry, makes a good tinder; the same substance served the ancient Greeks for lamp wicks, and the Romans dipped the stalks in suet to make funeral torches. High taper and hig or hag taper are old English names for the plant, and refer to its use in the incantations of witches.—Moth mullein (*V. blattaria*) is less common than the other, and more abundant in the eastern states than elsewhere; it is from 2 to 4 ft. high, with leaves and stem smooth and green; the flowers are in a leafy raceme, and yellow, or white with a tinge of purple; the filaments of the stamens are all bearded with violet-colored wool, which gives to the very ephemeral flowers no little beauty. This is also an introduced plant, having abroad an equally wide range with the preceding, and is of no other importance than as a weed for the farmer to get rid of.—The white mullein (*V. lychnitis*) is of rare occurrence in Pennsylvania and New York; its stem and leaves are clothed with a thin, powdery pubescence, and its yellow flowers (only rarely white)

are in a pyramidal panicle. It is also from Europe, where as well as here it hybridizes with the common mullein, and produces some puzzling intermediate forms.—Some species rank as ornamental plants, including *V. Chaixii* from the Pyrenees, which, unlike the others, is perennial; its abundant flowers are yellow, with a violet throat, and arranged in a large pyramidal panicle.

MÜLLENHOFF, Karl Victor, a German philologist, born at Marne, Holstein, Sept. 8, 1818. He studied in Berlin, and graduated in 1837 at Kiel, where he became professor of the German language and of ancient history. In 1858 he was transferred to the university of Berlin. His writings relate mainly to early German literature and philology, and include *Altdeutsche Sprachproben*; *Denkmäler deutscher Poesie und Prosa aus dem 8. bis 12. Jahrhundert*, with Scherer (Berlin, 1864); and *Deutsche Alterthumskunde* (1870).

MÜLLER, Charles Louis, popularly known as Müller de Paris, a French painter, born in Paris, Dec. 22, 1815. He studied under Cogniet and Gros, and in the school of fine arts, and in 1837 exhibited his first picture, "Christmas Morning." From 1850 to 1853 he was director of the manufacture of Gobelin tapestry, and in 1864 he succeeded Flandrin in the academy of fine arts. Among his principal works are "The Martyrdom of St. Bartholomew," "The Massacre of the Innocents," "Primavera," and "The Appeal of the Victims of the Reign of Terror." The last, his masterpiece, contains portraits of the most illustrious victims. In 1855 he exhibited a large painting, *Vive l'empereur*, illustrating a poem by Méry, representing an episode in the battle before Paris, March 30, 1814, which gained for him a medal of the first class. Among his later works are "Desdemona" (1868), and "Languisais at the Tribune" (1869).

MÜLLER, Friedrich, a German painter and poet, born in Creuznach in 1750, died in Rome, April 23, 1825. He early devoted himself to painting and copperplate engraving, and in his 18th year published several collections of etchings, which attracted much attention from their originality. In 1776 he went to Rome, and studied the works of Michel Angelo; but his taste for the grotesque constantly increased and gave a fantastic character to his productions. He was chiefly known as a guide in Rome, where he was called Müller the painter. He succeeded better as an author than as an artist, writing idyls, romances, ballads, and dramas. His best drama is *Niobe*. A complete edition of his works has been published (3 vols., Heidelberg, 1811; 2d ed., 1825).

MÜLLER, Friedrich, a German philologist, born at Jemnik, Bohemia, March 5, 1834. He completed his studies in Vienna from 1853 to 1857, and was employed as a librarian there from 1858 to 1866, when he became extraordinary and in 1869 ordinary professor of comparative philology and of Sanskrit at the uni-

versity, and a member of the academy of sciences. Benfey regards him as the highest authority on comparative philology and ethnology, and he has written extensively on these subjects for periodicals. His principal works are: *Reise der österreichischen Fregatte Novara: Linguistischer Theil* (Vienna, 1867), and *Ethnographischer Theil* (1868); and *Allgemeine Ethnographie* (1873).

MÜLLER, Friedrich Max, an English philologist, son of the poet Wilhelm Müller, born in Dessau, Germany, Dec. 6, 1823. He commenced his philological studies in Leipsic, where he took his degree in 1843. Induced by Hermann Brockhaus to give special attention to Sanskrit, he published in the following year his first work, a translation of the *Hitopadeśa*, a collection of Hindoo fables. After attending the lectures of Bopp and Schelling in Berlin, and examining the collection of Sanskrit manuscripts then purchased by the government, he went to Paris, where he prepared himself, at Burnouf's suggestion, to undertake the editing of the *Rig Veda* with the Sayana commentary. For the purpose of comparing the manuscripts of the Louvre with those in the possession of the East India company and those contained in the Bodleian library, he went in 1846 to England, where Bunsen and Wilson induced him to remain, and the East India company assumed the expense of the publication of his edition of the *Rig Veda*. The first volume of this stupendous work appeared in 1849, and the sixth and last at the end of 1874. Each volume consists of more than 1,200 pages. This edition has a special value from the masterly introductions prefixed to the volumes, which form important additions to the science of Indian antiquities and linguistics. The first volume of a second edition of the *Rig Veda*, without the Indian commentary, was published at Leipsic in 1856. He has published in German an excellent translation of Kalidasa's *Meghadūta* (Königsberg, 1847), a charming novel entitled *Deutsche Liebe* (Leipsic, 1857; English translation, Chicago, 1875), and several articles in philological journals; but most of his publications are in English. After a series of essays on the modern dialects of India, which appeared in the "Transactions of the British Association" and literary journals in England, he issued in 1854, on the occasion of the Crimean war, a treatise entitled "Suggestions on learning the Languages of the Seat of the War in the East." After the publication of "Proposals for a Missionary Alphabet" appeared his "History of ancient Sanskrit Literature" (1859), which has passed through several editions. The greatest success, however, has attended his "Lectures on the Science of Language," delivered at the royal institution of Great Britain in 1861 and 1863 (2 vols., London, 1861-'4), in which he shows in a popular style the bearing of the science of language on some important problems of philosophy and religion. His "Handbooks for the Study of Sanskrit,"

of which the first volume was published in 1865, are held in high esteem. They comprise a Sanskrit grammar and dictionary, and an edition of the text of the *Hitopadeśa* with a Latin transcription, an interlinear translation, and grammatical notes. In the years 1867-'70 appeared several volumes of his essays, first published in periodicals, under the title of "Chips from a German Workshop," on subjects pertaining to the science of religion, mythology, and the history of literature. In 1870 he delivered a course of lectures introductory to the science of religion, which produced considerable discussion in Europe and America. When they were published he added two essays on "False Analogy" and "The Philosophy of Mythology." He lectured in 1872 before the newly inaugurated university in Strasburg, and in 1873 in Westminster abbey, which led to remonstrances on the part of the orthodox clergy. Having settled in 1848 in Oxford, where his edition of the *Rig Veda* was to be printed, he was invited by the university to give courses of lectures on comparative philology as deputy Tylorian professor. Though once defeated as candidate for a professorship of Sanskrit, a new professorship of comparative philology was founded in 1868, with his name in the statute as the first incumbent. He has been since 1865 director of the oriental department of the Bodleian library, and in 1874 he presided over the Aryan section of the first international oriental congress.

MÜLLER, George, an English philanthropist, born at Kroppenstädt, Prussia, Sept. 27, 1805. He graduated at Halle, went to England in 1829, and in 1830 was settled as pastor over a small Independent chapel at Teignmouth. In a few months he relinquished his salary, believing that God would supply his wants in direct answer to prayer. In 1832 he became pastor at Bristol, refusing all salary except voluntary offerings. He established a free breakfast for all poor persons who would listen to religious reading while eating; but this was discontinued because the neighbors objected to the presence of so many beggars. In 1833 he opened two day schools, and before the end of the year had four schools in operation. In 1836 he determined to establish an orphanage, and hired a house for that purpose. By June, 1837, he had received £1,000 for his orphans, and considerable sums for other benevolent purposes. In 1838 he hired three houses, and supported 86 orphans. In 1842 he had ten schools and 96 orphans. In 1845 he determined to erect a building sufficient for all orphans that should be sent to him, and began to pray for £10,000, besides current expenses. In December a donation of £1,000 was sent to him; in July, 1846, he received a donation of £2,050; and up to January, 1847, he had received £9,284 besides current expenses. In 1850 the large orphan house was built and furnished at a cost of £15,000, and was im-

mediately filled with 300 orphans. At this time his annual receipts for all his enterprises amounted to £8,000, all of which he says was received in direct answer to prayer, without application to a single person. Praying for still more funds, he received in January, 1851, a gift of £3,000; in March, 1852, one of £1,000, and another of £500; in the spring of 1853 one of £8,100, and in the autumn one of £5,200. Believing it wrong to run in debt, he laid all these aside until he should have enough to finish one building. In May, 1856, he had accumulated £29,297, and began to build; and by May, 1860, he had received £45,000 for his building fund alone. In March, 1862, two more houses had been built and furnished, and were occupied by 700 orphans, making 1,000 supported by him, besides numerous schools and other benevolent undertakings. His three houses being full, he began to pray for funds to build two more. These were finished in 1870, when the five houses contained 2,050 children, besides teachers and attendants. During the year ending May 26, 1874, he received £37,855 15s. 6d., with which 189 missionaries and 122 schools were supported in whole or in part, 2,261 orphans maintained, and 47,413 Bibles or parts of the Bible and 3,775,971 tracts and books distributed. Between October, 1830, and May, 1874, he had received in all £617,000, by which 38,800 children had been taught in schools in Great Britain, Spain, Italy, India, and British Guiana; 467,000 Bibles and Testaments had been distributed, 50,000,000 tracts circulated, 190 missionaries supported year by year, and 4,408 orphans brought up. The orphans, after being educated, are put out to service or apprenticed to trades. The five orphan houses, erected at a cost of £115,000, are vested in a board of trustees; but they have no endowments, as their founder believes that funds will be provided as required. He is also pastor of a church of 900 members, built up by his own labors.

MÜLLER, Gerhard Friedrich, a Russian historian, born at Herford, Westphalia, Oct. 18, 1705, died in Moscow in October, 1783. He studied at Leipsic, became in 1725 a teacher in St. Petersburg, and in 1730 was appointed professor of history. In 1733 he accompanied Gmelin and De Lisle de la Croyère to Siberia, and returned in February, 1743, having spent the interval in studying the geography and antiquities of that country. In 1747 he was appointed historiographer of the Russian empire, in 1754 secretary of the academy of sciences, in 1766 keeper of the archives at Moscow, and afterward councillor of state. He is best known by his *Sammlung Russischer Geschichte* (9 vols., 1732-'64). His other writings include *Histoire des voyages et découvertes des Russes* (2 vols., Amsterdam, 1766). He has been called the father of Russian history, wrote French, Latin, Russian, and German with equal ease, and was the first to found a literary journal in the Russian language.

MÜLLER, Johann. See REGIMONTANUS.

MÜLLER. I. Johann Gotthard von, a German engraver, born at Bernhausen, near Stuttgart, May 4, 1747, died in Stuttgart, March 14, 1830. He prepared himself for the church, but attended at the same time the academy of fine arts. He studied engraving in Paris, where he remained from 1770 to 1776, when he was admitted to the French academy of fine arts, and was appointed by Duke Charles to found a school of art at Stuttgart, which under his guidance produced many excellent artists. Among his best prints are the "Battle of Bunker Hill," after Trumbull's picture, Raphael's *Madonna della Seggiola*, St. Catharine after Leonardo da Vinci, and a portrait of Louis XVI. **II. Johann Friedrich Wilhelm**, son of the preceding, born in Stuttgart in 1782, died near Dresden, May 3, 1816. After a careful training under his father he completed his studies in Paris, where besides other works he executed engravings of "St. John" and "St. Cecilia" after Domenichino. After preparing in Rome for the engraving of Raphael's *Madonna di San Sisto*, he devoted the remainder of his life to that masterpiece, his reproduction of which is one of the finest achievements of the art. In 1814 he was appointed professor in the academy at Dresden, but his health being impaired by overwork, he retired. He engraved in all only 18 plates.

MÜLLER, Johann Heinrich Jakob, a German physicist, born in Cassel, April 30, 1809, died Oct. 3, 1875. He studied in Darmstadt, Bonn, and Giessen, taught at Darmstadt, and in 1844 was appointed professor of physical sciences at Freiburg, Baden. His principal work, *Lehrbuch der Physik und Meteorologie* (2 vols., Brunswick, 1842; 7th ed., 1868-'9), was originally a version of Pouillet's *Éléments de physique*; and he published a supplement to it, *Lehrbuch der kosmischen Physik* (1856; 3d ed., 1872). Among his other works are: *Grundriss der Physik und Meteorologie* (1846; 10th ed., 1869-'70; with two supplements); *Grundzüge der Krystallographie* (1845; 2d ed., 1869); *Die constructive Zeichnungslehre* (2 vols. 1868); and *Anfangsgründe der geometrischen Disciplin für Gymnasien, &c.* (3d ed., 1869).

MÜLLER, Johannes, a German physiologist, born in Coblenz, July 14, 1801, died in Berlin, April 28, 1858. He was the son of a poor shoemaker, and was about to be apprenticed to a saddler when his talents attracted the attention of his teacher, and he prepared himself for the Roman Catholic priesthood. After attending in 1819 the university of Bonn, he took the degree of M. D. and went to Berlin, where under the influence of Hegel and Rudolphi he was induced to reject all systems of physiology which were not founded upon a severe philosophical observation of nature. Returning to Bonn in 1824, he lectured as private professor on anatomy, physiology, embryology, and related subjects; and in 1826 he became extraordinary professor of physi-

ology and anatomy. In 1833 he was appointed to the chair of anatomy in the university of Berlin, then considered the first in Europe in that department of science. He founded the physico-chemical school of physiology, raising it from a speculative to a positive science, and reformed the study of medicine. He generally passed his vacations on the shores of the Mediterranean, where he became a favorite with the Italians. His publications, numbering upward of 100, embrace nearly every subject in comparative anatomy and physiology, not one of which failed to receive new and valuable illustrations from his hand. His most important work is the *Handbuch der Physiologie* (Coblentz, 1833), which has been translated into English by Dr. W. Baly ("Elements of Physiology," 2 vols., London, 1837-'42), and into several other languages. Among his other works are: *De Respirazione Fœtus* (Leipsic, 1823), a prize dissertation; *Zur vergleichenden Physiologie des Gesichtsinnes des Menschen und der Thiere* (1826; English translation by Baly, 1848); *Grundriss der Vorlesungen über die Physiologie* (Bonn, 1827); *Grundriss der Vorlesungen über allgemeine Pathologie* (1829); and *Ueber die organischen Nerven der erectilen männlichen Geschlechtsorgane, &c.* (Berlin, 1835). He also wrote numerous dissertations on subjects not altogether physiological. Among these are: *Horæ Ichthyologicae* (Berlin, 1849); *Ueber die phantastischen Gesichterscheinnungen* (Coblentz, 1826); *Der Tabak in geschichtlicher, botanischer, chemischer und medicinischer Hinsicht* (Berlin, 1832); *Ueber die fossilen Reste der Zeuglodonten, &c.* (1848); and *Ueber Synopta digitata und über die Erzeugung von Schnecken in Holothurien* (1852). His latest investigations were devoted to infusoria, and his *Terminologia Entomologica* was published at Brinn in 1850. He also founded several influential periodicals for the promotion of physiology, anatomy, and other sciences.

MÜLLER, *Johannes von*, a Swiss historian, born in Schaffhausen, Jan. 3, 1752, died in Cassel, May 29, 1809. He completed his studies at Göttingen, where Schlözer diverted his attention from theology to history. He was professor of Greek in Schaffhausen from 1772 to 1774, when he removed to Geneva, where for a time he supported himself by teaching. In 1781 he accepted a professorship in Cassel, but returned to Switzerland in 1783 to prosecute historical labors, lecturing occasionally, but generally depending upon friends and incurring large debts. From 1786 to 1807 he was in the service, in various capacities, of the elector of Mentz, the emperor, and the king of Prussia, and received several titles and patents of nobility. After the occupation of Berlin by the French, he incurred the displeasure of his German friends by his subserviency to Napoleon, and by holding office under his brother, King Jerome of Westphalia. This sentiment, however, subsequently gave way to

a general acknowledgment both of his extraordinary merits as a writer and the noble traits of his character. His most celebrated work is *Die Geschichte der schweizerischen Eidgenossenschaft* (4 vols., 1780-1805), extending to 1489, and continued to the end of the 16th century by Glutz-Boltzheim (vol. v., 1816) and J. J. Hottinger (vols. vi. and vii., 1825-'9). A French translation by Monnard and Vulliemin extends to the 19th century (19 vols., Paris, 1837-'51). Among his other writings are minor political essays; *Essais historiques*, published in French under the auspices of Frederick the Great (Berlin, 1780); *Reisen der Päpste* (new ed., Aix-la-Chapelle, 1831; French translation, 1859), written against the anti-papal reforms of Joseph II., although he was a Protestant; and *Vierundzwanzig Bücher allgemeiner Geschichten*, lectures delivered in Switzerland (3 vols., Tübingen, 1811; often republished). His complete works have been published in 27 vols. (Stuttgart, 1810-'19), and 40 vols. (1831-'5). Among his biographers are Heeren (1809), Wachler (1809), and Woltmann (1810).

MÜLLER. I. *Karl Otfried*, a German archæologist, born in Brieg, Silesia, Aug. 28, 1797, died in Athens, Greece, Aug. 1, 1840. He was educated at the gymnasium of Brieg, the university of Breslau, and that of Berlin, where he graduated in 1817, and published in the same year his *Ægineticorum Liber*. On leaving Berlin he was appointed instructor in ancient languages in the Magdalenum of Breslau, where he employed much time in mythological studies and in the analysis of the different mythical cycles, the results of which are embodied in his *Geschichte hellenischer Stämme und Städte*, of which vol. i., *Orchomenos und die Minyer*, appeared at Breslau in 1820. At the recommendation of Böckh he was appointed in 1819 to a professorship at Göttingen, the duties of which included a series of lectures on archæology and ancient art; and to prepare himself he visited France, England, and various parts of Germany. His *Die Dorier* (2 vols. 8vo., Breslau, 1824), forming vols. ii. and iii. of the *Geschichte hellenischer Stämme und Städte*, was intended to show the connection of manners, religion, politics, and history in one of the Greek races. An English translation by H. Tuffnell and Sir George Cornewall Lewis was published at Oxford in 1830, with additions and corrections by the author, and a new German edition of the whole work was published at Breslau (3 vols., 1844). Of his remaining works, the most important are the *Prolegomena zu einer wissenschaftlichen Mythologie* (Göttingen, 1825; English translation by J. Leitch, London, 1844); *Ueber die Wohnsitze, die Abstammung und die ältere Geschichte des makedonischen Volkes* (Berlin, 1825); *Die Etrusker* (Breslau, 1828); and *Handbuch der Archæologie der Kunst* (translated by Leitch, London, 1850). He also undertook for the society for the diffusion of useful knowledge a

history of Greek literature, the first volume of which was translated into English by Lewis and Donaldson (1840), previous to its publication in Germany, where it was issued after Müller's death by his brother Eduard (*Geschichte der griechischen Literatur bis auf das Zeitalter Alexanders*, 2 vols., Breslau, 1841; 2d ed., 1857), and was brought down by Donaldson in English to the capture of Constantinople (3 vols., London, 1858). He published also several special archæological treatises and articles in periodicals, and edited Festus, Varro's *De Lingua Latina*, and the *Eumenides* of Æschylus. In 1839 he undertook a tour of exploration in southern Italy and Greece, and while superintending excavations at Delphi contracted a fatal fever. He was removed before his death to Athens, and buried on an eminence near the site of Plato's academy. A collection of his *Kleine deutsche Schriften* was published posthumously by his brother Eduard (3 vols., Breslau, 1847-'8).—See *Erinnerungen an Otfried Müller*, by Lücke (Göttingen, 1841). **II. Julius**, a theologian, brother of the preceding, born in Brieg, April 10, 1801, died Sept. 27, 1878. He abandoned the study of law for that of theology, and was settled over several small parishes from 1825 to 1831. He was then appointed preacher at the university of Göttingen, and in 1834 professor of theology. From 1835 to 1839 he filled the same chair at Marburg, and afterward at Halle. He published various theological works and essays, and his *Die Christliche Lehre von der Sünde* (Breslau, 1839; 4th revised ed., 2 vols., 1858; English translation by W. Pulsford, "The Christian Doctrine of Sin," 2 vols., Edinburgh, 1852-'3) is one of the most noted productions of contemporary German Protestant literature. In 1850 he was associated with Neander and Nitzsch in founding the *Deutsche Zeitschrift für christliche Wissenschaft und christliches Leben*. Having been a representative of evangelical union in the Berlin synod of 1846, he published in 1854 *Die evangelische Union, ihr Wesen und göttliches Recht*. **III. Eduard**, brother of the preceding, born in Brieg, Nov. 12, 1804. Since 1853 he has been director of the gymnasium of Liegnitz, and has published *Geschichte der Theorie der Kunst bei den Alten* (2 vols., Breslau, 1834-'7), and a tragedy, *Simson und Delilah* (1853).

MÜLLER, Otto, a German novelist, born at Schotten, Hesse-Darmstadt, June 1, 1816. He began his career as a librarian and a journalist, and resided in various places till 1856, when he settled in Stuttgart. He early published a series of novels, and in 1845 appeared his *Bürger, ein deutsches Dichterleben*, which was followed by *Georg Volker* and other political novels. In 1854 appeared his admirable *Charlotte Ackermann*. Among his subsequent novels are *Der Klosterhof* (1859), *Aus Petrarca's alten Tagen* (1862), *Erzählungen und Charakterbilder* (1865), *Der Wildpfarrer* (1866), *Der Professor von Heidelberg* (1870), *Der Fall von Konstanz* (1872), and *Der Majoratsherr*

(1873). His *Ausgewählte Schriften* appeared in Stuttgart (12 vols., 1874).

MÜLLER, Otto Frederik, a Danish naturalist, born in Copenhagen in March, 1730, died Dec. 26, 1784. He was educated for the church, became tutor to a young nobleman, and after several years' travel with him settled in Copenhagen in 1767, and married a lady of wealth. His first important works, *Fauna Insectorum Friedrichsdaliana* (Leipsic, 1764), and *Flora Friedrichsdaliana* (Strasbourg, 1767), recommended him to Frederick V. of Denmark, by whom he was employed to continue the *Flora* of Denmark, and he added two volumes to the three published by Oeder since 1761. The study of zoölogy, and particularly of the minute animals, meanwhile began to occupy his attention almost exclusively, and in 1771 he produced a work in German on "Certain Worms inhabiting Fresh and Salt Water," which described many new species of those annulose animals called by Linnæus *aphroditæ* and *nereides*, and gave much additional information respecting their habits. In his *Vermium Terrestrium et Fluviatilium, seu Animalium Infusoriorum, Helminthecorum, et Testaceorum non Marinorum, succincta Historia* (2 vols. 4to, Copenhagen and Leipsic, 1773-'4), he arranged the infusoria for the first time into genera and species. His *Hydrachnæ in Aquis Danicæ Palustribus detectæ et descriptæ* (Leipsic, 1781), and *Entomostraca* (1785), describe many species of minute animals previously unknown. To these was added an illustrated work on the infusoria, published in 1786. These three works, according to Cuvier, give the author "a place in the first rank of those naturalists who have enriched science with original observations." His *Zoologica Danica*, which was intended to correspond in the animal kingdom with the *Flora Danica* in the vegetable, was commenced in 1779, but only two parts, each containing 40 plates, were finished by him.

MÜLLER, Peder Erasmus, a Danish bishop, born in Copenhagen, May 29, 1776, died Sept. 16, 1834. He was educated at the university of Copenhagen, where, after visiting France and England, he was appointed professor of theology in 1801, and in 1830 bishop of Seeland. He published theological treatises and works on the language, literature, and history of Denmark and Iceland. The most celebrated is his "Library of the Sagas" (1816-'20), in which he gives an account of all the Icelandic sagas or tales. From 1805 to 1832 he was editor of the "Danish Literary Gazette" (*Dansk Literatur Tidende*).

MÜLLER, Sophie, a German actress, born in Mannheim in 1803, died at Hietzing, near Vienna, June 20, 1830. She was a daughter of the actor Karl Müller (1783-1837), and appeared on the Carlsruhe stage in her 15th year. In 1821 she went to Munich, and in 1822 was engaged at the court theatre of Vienna, acquiring the reputation of one of the most distinguished tragedians of her day. She also

became reader to the empress of Austria. Her biography, by Mailáth, was published at Vienna in 1832.

MÜLLER, Wilhelm, a German poet, born in Dessau, Oct. 7, 1794, died there, Oct. 1, 1827. He studied at the university of Berlin, and after serving in the war of liberation (1813-'14) he returned to Berlin, and applied himself especially to the ancient German language and literature. From 1817 to 1819 he travelled in southern Germany and Italy, and on returning was appointed classical instructor in the new normal school of Dessau. His works include *Blumenlese aus den Minnesängern* (1816); a translation of Marlowe's "Faustus" (1818); and *Lieder der Griechen* (1821-'4). His translation of patriotic Greek songs for Fauriel's collection (2 vols., 1825), and his *Lyrische Spaziergänge* (1827), are his best productions. His *Vermischte Schriften* were published by S. Schwab with a biography (5 vols., Leipsic, 1830). His *Gedichte* (2 vols., 1837) had several editions, and his *Ausgewählte Gedichte* appeared in 1864. He was the father of Max Müller. (See MÜLLER, FRIEDRICH MAX.)

MÜLLER, William John, an English painter, born in Bristol in 1812, died there, Sept. 8, 1845. He studied with J. B. Pyne, the landscape painter, and in 1833-'4 made a tour through Germany, Switzerland, and Italy. In 1838-'9 he made a tour through Greece and Egypt, among the results of which were two landscapes, "Athens from the Road to Marathon," and "Memnon, or Ruins at Gornou in Egypt at Sunset." In 1843 he accompanied Sir Charles Fellows on his expedition in quest of the Xanthian marbles. Five pictures of Asiatic scenery in the exhibition of 1845 were, like previous contributions, treated with neglect, and soon after he was seized with illness, the result of mortification, from which he never recovered. His pictures subsequently commanded high prices, and a collection of 300 sketches was sold soon after his death for £4,360.

MÜLLER VON KÖNIGSWINTER, Wolfgang, a German poet, born at Königswinter, near Bonn, March 5, 1816. He studied medicine at Bonn, graduated at Berlin in 1840, and was a physician in Düsseldorf from 1842 to 1853, when he removed to Cologne, where he became a popular poet, novelist, and chronicler of the Rhine region. Among his works are: *Junge Lieder* (1841); *Balladen und Romanzen* (1842); *Rhein-fahrt* (1846); *Gedichte* (2d ed., 1857); *Lorelei* (2d ed., 1857); *Eine Maikönigin* (1852); *Prinz Minnewin* (1854); *Der Rattenfänger von St. Goar* (1857); *Johann von Werth* (1858); *Erzählungen eines rheinischen Chronisten* (1860); *Vier Burgen* (1862); *Zum stillen Vergnügen* (1865); *Der Pilger in Italien* (1868); and *Durch Kampf zum Sieg* (1871).

MULLET, a name given to two families of acanthopterygian fishes, the *mugilidæ* and the *mulloidæ*, though the latter, to avoid confusion, are better styled surmullet. In the *mugilidæ* the body is more or less cylindrical; head and

body covered with large, easily detached scales, in reality ctenoid, but so slightly denticulated as to appear cycloid; gill covers thin and smooth; head flattened, and the eyes large and far apart; the mouth small, and the teeth, when present, exceedingly fine; a kind of crest in the lower jaw received into a groove in the upper; dorsals two, small and distinct, the first with usually four spinous rays, the second with flexible rays; ventrals behind pectorals; the pharyngeals are very large, the stomach rather fleshy, and the intestine with a few pyloric cæca; the swimming bladder is large. More than 50 species of the principal genus *mugil* (Linn.) have been described, from Europe, America, Africa, and the East Indies, inhabiting salt water, in preference about the mouths of rivers which they can ascend or descend with the tide. The gray mullet of western Europe (*M. capito*, Cuv.) attains a length of from 1 to 2 ft., the color above is dusky gray tinged with blue, the sides and belly silvery with longitudinal parallel dusky lines; a dark spot at the base of the pectoral fin. They are highly esteemed as food, and are caught in nets, from which they attempt to escape by jumping over the edge. This species is common on the English coasts, never far from land, and ventures many miles inland with the tide; it is one of the species which thrive in fresh water; the food consists of soft or decaying animal or vegetable substances; the spawning time is in midsummer. The gray mullet of the Mediterranean (*M. cephalus*, Cuv.) may be known by the two adipose veils which half cover the eyes, by the long ridged scale at the base of the pectoral fins, and by the entire concealment of the maxillary bone when the mouth is shut; it attains a weight of 10 or 12 lbs., and is taken in nets in great quantities at the mouths of rivers; the flesh is tender, delicate, and fine-flavored, and has been esteemed from ancient times; it is eaten fresh, salted, and smoked. Of the American species may be mentioned the striped mullet (*M. lineatus*, Mitch.), 6 or 8 in. long, purplish brown above, lighter on the sides, with 10 or 12 dark brown longitudinal stripes, pupils black and

Striped Mullet (*Mugil lineatus*).

irides yellowish white, and abdomen pearl gray; this is an excellent fish, ranges from New York southward, and appears in the markets in early autumn; the white mullet (*M. albula*, Linn.), of a general whitish color, about 9 in. long, plump and firm, appearing in

July and August, and prized by epicures; and the rock mullet (*M. petrosus*, Cuv.), like the last, found from New York to the gulf of Mexico. The African and Asiatic species are generally greenish brown above, with golden and silvery reflections, and white below.—The other family of mullets, more properly called surmullets (*mullidæ*), have some affinities with the perch family in the position of the fins, but differ from them in the unarmed opercula and the slightly ctenoid character of the scales; the branchiostegal rays are four; the scales are large and easily detached; the dorsals are two, widely separated, and all the fins are moderate; body oblong, little compressed; profile nearly vertical; mouth small, and teeth feeble; gill opening wide; eyes large and at top of the head; in most species the lower jaw has two barbels at the symphysis. In the genus *mullus* (Linn.) there are no teeth in the upper jaw, but pavement-like ones on the vomer and lower jaw, and no air bladder. The red mullet (*M. surmuletus*, Linn.) is bright red above and on the sides, with three golden yellow longitudinal lines behind the pectorals, and rosy white below; it attains a length of 12 to 15 in. It is found from the English coast southward, being more common to the south, and very abundant in the Mediterranean, where it feeds upon crustaceans and mollusks; it is less esteemed as food than the next species. The bearded mullet (*M. barbatus*, Linn.) has a more vertical profile and a deeper and more

Bearded Mullet (*Mullus barbatus*).

uniform red color; comparatively rare north of the English channel, it is most abundant in the Mediterranean; this is the *rouget* of the French. Of about the same size as the last, it is more highly esteemed for its white, firm, well flavored, and easily digested flesh; the old Roman epicures paid immense prices for this fish; they kept them alive in *vivaria*, and exhibited their brilliant colors, rendered more beautiful in the agonies of death, to their guests.—In America fish of the allied genus *upeneus* (Cuv.), with teeth in both jaws, are called mullets; most of these have a large air bladder. The *U. maculatus* (Bloch), with others, 6 or 8 in. long, is found in the gulf of Mexico, the West Indies, and South America; the color is red, with a few blackish spots; the flesh is not much prized.

MÜLLNER, Amadeus Gottfried Adolf, a German dramatist, born at Langendorf, near Weissenfels, Oct. 18, 1774, died in Weissenfels, June 11, 1829. He practised for some time as a lawyer, and wrote on jurisprudence; but he is best known by his dramas *Der neunundzwanzigste Februar* and *Die Schuld*, which were among the most popular productions of the fatalistic dramatic school. His miscellaneous writings were published in 2 vols. (Stuttgart, 1824-'6), and his dramatic works in 7 vols. (Brunswick, 1828). The hundredth anniversary of his birth was celebrated at Weissenfels in 1874.

MULOCK, Dinah Maria. See CRAIK.

MULREADY, William, a British painter, born in Ennis, Ireland, April 1, 1786, died at Bayswater, near London, July 7, 1863. He was admitted a student of the royal academy at 14 years of age. His "Rattle" (1808), "Roadside Inn" (1811), and "Punch" (1813) showed careful study from nature and a good idea of color. His "Idle Boys" (1815) procured his election as an associate of the academy, and in 1816 he was admitted to full membership. His subsequent works, including "The Fight Interrupted" (1816), "Lending a Bite" (1819), "The Wolf and the Lamb" (1820), "The Convalescent" (1822), "The Origin of a Painter" (1826), "The Last In" (1835), "First Love" (1840), and "The Ford" (1842), established his reputation. In 1840 he prepared 20 designs to illustrate the "Vicar of Wakefield," which suggested his subsequent pictures, "The Whistonian Controversy" (1844), "Choosing the Wedding Gown" (1846), and "Burchell and Sophia" (1847). Of his later works the best known are "The Butt" (1848), "Women Bathing" (1849), and "Blackheath Park" (1852). Choice specimens of his style are contained in the royal collection, in the Vernon and Sheepshanks portions of the national gallery, and in the Peel collection.

MULSO, Hester. See CHAPONE.

MULTNOMAH, a N. W. county of Oregon, bordering E. on the Cascade mountains, bounded N. by the Columbia river, and intersected in the west by the Willamette; area, about 400 sq. m.; pop. in 1870, 11,510, of whom 508 were Chinese. The soil is generally fertile, and agriculture and cattle raising are the chief industries. It is traversed by the Oregon and California and Oregon Central railroads. The chief productions in 1870 were 5,003 bushels of wheat, 1,473 of Indian corn, 11,882 of oats, 3,724 of barley, 1,826 of peas and beans, 60,490 of potatoes, 4,626 lbs. of wool, 115,549 of butter, 11,260 of cheese, and 6,138 tons of hay. There were 838 horses, 1,966 milch cows, 2,213 other cattle, 2,583 sheep, and 2,583 swine; 1 manufactory of awnings and tents, 4 of bread, 8 of carriages and wagons, 27 of clothing, 3 of confectionery, 6 of cooperage, 5 of furniture, 4 of iron castings, 6 of engines and boilers, 5 of saddlery and harness, 3 of sash, doors, and blinds, 8 of tin, copper,

and sheet-iron ware, 5 of upholstery, 5 tanneries, 4 breweries, 3 flour mills, 1 planing mill, 7 saw mills, and 1 beef and 1 pork packing establishment. Capital, Portland.

MUMMIUS, Lucius, a Roman general of the 2d century B. C. He was prætor in 154 B. C. His province was Further Spain, where he met with several defeats, but finally was victorious over the Lusitanians and Bosto-Phœnicians. When he became consul in 146, the Achæan chiefs, only partially humbled by the victories of Metellus, his predecessor, had assembled an army on the isthmus of Corinth. Mummius took command in person, easily defeated the Achæans, and entered Corinth. The city, almost entirely deserted by its inhabitants, was pillaged and burned. Mummius carried off an immense quantity of spoils, consisting largely of the finest paintings and statuary in Greece. Many of the rarer works he sold to the king of Pergamus, and the remainder he sent to Rome, where such of them as had escaped the perils of the sea were exhibited in his triumph. For his great victory, which completed the conquest of Greece, Mummius received the surname Achaicus, being the first *novus homo* thus honored for military service. He

remained in Greece during the greater part of the years 146 and 145, having in the latter year the title of proconsul. He governed wisely, and respected the religion of the people. He became censor in 142 with Scipio Africanus the younger; the two men were exact opposites in character and culture, and disagreed in everything. Mummius was rustic, rigidly honest, but lenient to others, and died poor.

MUMMY (Persian and Arabic, *mumiyā*, from the Persian *mum*, naphtha or liquid asphaltum), a dead body embalmed, or preserved from decay by desiccation. The custom of thus preserving the bodies of the dead prevailed among several ancient nations. The Assyrians, Persians, and Ethiopians practised it to some extent, as did also the Hebrews, Greeks, and Romans, and in America the Mexicans and Peruvians; but it was most general among the Egyptians, who embalmed all their dead. For the methods employed by the last, see **EMBALMING**. After the embalming process was finished, the Egyptians swathed the body with narrow linen bandages

gum of the *mimosa Nilotica*. These were wound around with great nicety, all the irregularities being padded so as to bring the body to a symmetrical shape. In the Greek and Roman period the limbs were bound separately, but the Egyptians enclosed in one envelope the entire body, which when thus prepared exhibited only the general outlines of the human form, even the face being covered. The bandages, which differ in quality from fine muslin to coarse canvas, were sometimes more than 1,000 yards in length. The body was next enclosed in a cartonnage or case made of layers of cloth cemented together, which was probably adjusted to it when damp so as to take its exact shape. When fitted it was taken off, dried, and then put on again and sewed up at the back; after which it was richly painted and gilded, the face being colored to represent

1. Mummy in Bandages. 2. Cartonnage. 3. Outer Case. 4. Sarcophagus.

the features of the deceased, or overlaid with thick gold leaf, and the eyes made of enamel. The cartonnage was covered with other cases, sometimes three or four, made of cedar or sycamore, similarly painted. The cases varied in number, beauty, and style, in proportion to the expense incurred by the friends of the deceased, and the whole was sometimes placed in an outer sarcophagus of wood or stone, ornamented with paintings or sculptures. Mummies thus prepared were of those embalmed by the most expensive process, generally the bodies of priests or other dignitaries. The bodies of the middle classes seldom had more than one covering, and those of the lower orders were merely wrapped in coarse mats. Within the bandages were often placed papyri, small figures of Osiris in blue porcelain, scarabæi, amulets, necklaces of glass beads or agate, ear rings, finger rings, bracelets, hair pins, and other ornaments; and many of these are now found in mummies which have been undisturbed. Mummies preserved by resinous substances are of an olive color, and the skin dry, flexible, and as if tanned. The features appear

as during life; the teeth, hair, and eyebrows are well preserved. Mummies of this kind are light, dry, and easily broken. Those filled with bitumen are black; the skin hard and shining, as if varnished; the features perfect; and the whole corpse dry, heavy, and difficult to break. Of mummies preserved with natron and filled with asphaltum and resinous substances, the skin is hard and elastic, resembling parchment, and does not adhere to the bones; the countenance is little altered, but the hair falls off on being touched. The bodies of the poor, which were salted and boiled in bitumen, are black, dry, heavy, and very hard to break, and neither the hair nor the eyebrows are preserved. It has been estimated that more than 400,000,000 human mummies were made in Egypt from the beginning of the art of embalming until its discontinuance in the 7th century. In addition to these, vast numbers of sacred animals, bulls, apes, cynocephali, dogs, cats, sheep, vultures, falcons, ibises, geese, lizards, serpents, crocodiles, and fish were embalmed. The principal places where mummies are found are the necropolis in the plain of Sakkarah, opposite the site of Memphis, and the necropolis of Thebes. Great numbers have been removed, and mummies of the best class are now scarce. Many are burned for fuel by the Arabs, and ship loads have been transported to England to be ground up for manure.

MUMPS (*cynanche parotidea*, *parotitis*), a specific inflammation of the parotid and submaxillary glands. This curious affection, called by the Scotch *branks*, and by the French *oreillons* or *ourles*, has been known from the time of Hippocrates. It commences with a feeling of pain and tension beneath the ear, swelling takes place, and motion of the jaw is painful. The swelling soon involves the parotid and submaxillary glands; it is somewhat pasty to the feel, and is unattended with redness of the skin. Sometimes one side only is affected, sometimes both at once, more commonly one after the other. The disease is attended with slight fever, but the pain is by no means proportioned to the swelling and the deformity. The duration of the complaint is from eight to ten days, it taking four days to attain its height, and four days being occupied by its decline. Occasionally in males the testes, and in females the breasts, become swollen and hard as the swelling of the salivary glands subsides; and very rarely, in the subsidence of the swelling, either of the parotid or of the testes, inflammation of the brain or its membranes has occurred. The disease is often epidemic, and is generally believed to be contagious. It ordinarily requires little treatment, the administration of a laxative and warm and emollient applications to the affected part being all that is necessary. When the brain is attacked, it must be treated irrespective of the original affection.

MUNCH, Ernst Hermann Joseph von, a German historian, born in Rheinfelden, Switzerland,

Oct. 25, 1798, died there, June 9, 1841. He was for some time professor at Freiburg, and filled the chair of ecclesiastical history and law at Liège. He was also royal librarian at the Hague, and director of the private library of the king of Würtemberg. Among his principal works are *Allgemeine Geschichte der neuesten Zeit* (6 vols., Leipsic, 1833-'5), and his autobiography, *Erinnerungen und Studien aus den ersten 37 Jahren eines deutschen Gelehrten* (3 vols., Carlsruhe, 1836-'8).

MUNCH, Friedrich, a German author, born at Niedergemünden, Hesse-Darmstadt, June 25, 1799. He is the son of a clergyman, studied theology at Giessen, and succeeded his father as pastor of the village church. He founded in 1833, with Paul Follen, an emigration society at Giessen, and came with a number of emigrants to the United States, settling as a farmer in Missouri. He was active in promoting German immigration, and was a member of the Missouri senate from 1862 to 1866. He has published *Ueber Religion und Christenthum* (1847), of which an English edition appeared in Boston; *Der Staat Missouri* (New York, 1859; 2d ed., abridged, Bremen, 1866); *Amerikanische Weinbauschule* (3d ed., St. Louis, 1867); *Die sinnliche und die geistige Lebensansicht* (Philadelphia, 1871); *Geisteslehre für die heranreifende Jugend* (St. Louis, 1872); and *Das Leben von Karl Follen* (Neustadt-on-the-Haardt, 1872).

MUNCH, I. Peder Andreas, a Norwegian historian, born in Christiania, Dec. 15, 1810, died in Rome, May 25, 1863. He graduated in 1834 at the university of Christiania for the civil service, but devoted himself to philology and history, and became lecturer in 1837, professor in 1841, and historiographer of the king and archivist of Norway in 1861. His principal work is *Det norske Folks Historie* (9 vols., Christiania, 1852-'63), for the preparation of which he visited England, Scotland, and France. From 1858 to 1861 he was at work in the archives of the Vatican, and he returned to Rome shortly before his death. He also published grammars of the Runic, Old Norwegian, and Old Norse languages, and prepared several editions of Old Norse philological works. **II. Andreas**, a Norwegian poet, cousin of the preceding, born Oct. 19, 1810. He was the son of the bishop of Christiansand, and studied jurisprudence at Christiania. He published a volume of poems in 1836 and a drama in 1837. From 1841 to 1846 he edited a journal, and from 1850 to 1860 was amanuensis in the university library. A stipend voted to him by the storting in the latter year enabled him to devote himself to literature, and to publish collections of his poems. His *Sorg og Trøst* (1852) has had several editions. Among his other works are *Billeder fra Syd og Nord*, an account of a journey to Italy (1848), and the dramas *Salomon de Caus* (1854), *En Aften paa Giske* (1855), *Lord William Russel* (1857), and *Hertug Skule* (1863).

MÜNCH-BELLINGHAUSEN, Eligius Franz Joseph von, baron, a German dramatist, known by his pseudonyme of Friedrich Halm, born in Cracow, April 2, 1806, died in Vienna, May 21, 1871. His first drama, *Griseldis* (Vienna, 1834), was well received. Of the succeeding ones, the most celebrated are *Der Sohn der Wildniss* (1842; translated into English by Charles E. Anthon, New York, 1848, under the title of "The Son of the Wilderness," but frequently performed on the American stage under that of "Ingomar the Barbarian"), and *Der Fechter von Ravenna* (1854). Among his later works is a drama entitled *Iphigenie in Delphi*, in imitation of Goethe's *Iphigenie*, and a play written for the Schiller festival in 1859 entitled *Vor hundert Jahren*. He published a volume of poetry (1850), a work on ancient Spanish plays (1852), and an edition of his works (8 vols., 1857-'64). In 1861 he was made member for life of the Austrian house of lords. For several years he was first keeper of the imperial library, and from 1867 to 1870 director of the court theatre in Vienna.

MÜNCHHAUSEN, Hieronymus Karl Friedrich von, baron, a German soldier, born at Bodenwerder, Hanover, in 1720, died there in 1797. He served in his youth as a cavalry officer in the Russian army, and passed his latter days in Hanover. He delighted in telling wonderful stories of his adventures in the campaign against the Turks in 1737-'9, which gained for him the reputation of being one of the greatest liars who ever lived. The stories were repeated from one end of the country to the other, and created universal merriment. They are said to have been first compiled by Rudolf Erich Raspe, a man of letters, who, being compelled to flee from Cassel to England on account of a charge of embezzlement, was engaged in London in literary pursuits, and is generally believed to have published anonymously an English edition of the stories under the title of "Baron Munchausen's Narrative of his Marvellous Travels and Campaigns in Russia" (London, 1785). A second edition, considerably enlarged and ornamented with views from the baron's drawings, was published at Oxford in 1786, under the title of "The Singular Travels, Campaigns, Voyages, and Sporting Adventures of Baron Munnikhousen, commonly pronounced Munchausen; as he relates them over a bottle when surrounded by his friends." A third edition (London, 1786) bore the additional title of "Gulliver Revived," and was soon followed by others. The work was first issued in a German form in 1787, under the auspices of the poet Bürger. A German edition of this famous work, entitled *Des Freiherrn von Münchhausen wunderbare Reisen und Abenteuer* (Göttingen and Berlin, 1849), contains an introduction by Adolf Ellisson upon the life and writings of the author, the sources and originals of the Münchhausens, and the literature of fictitious travels in general. But a large proportion of the hunting

stories in this edition are derived from Henry Bebel's *Facetiæ* (Strasburg, 1508), while other incidents are borrowed from Castiglione's *Cortegiano* and Bildermann's *Utopia*, which are included in Lange's *Delicia Academicæ* (Heilbronn, 1765). A free German version of the English edition appeared in Leipsic in 1846, under the title of *Münchhausens Lügenabenteuer*. The work still maintains its popularity in Germany as well as in England and the United States. Imitations of Münchhausen's stories are called in Germany *Münchhausiaden*. The success of the work gave rise to Immermann's celebrated novel *Münchhausen* (4 vols., 2d ed., Düsseldorf, 1841), and to Adolf Schrödter's picture representing the baron surrounded by his listeners.

MUNDT. I. Theodor, a German author, born in Potsdam, Sept. 19, 1808, died in Berlin, May 30, 1861. He was educated in Berlin and Leipsic, and became prominent among the young Germany school of writers and politicians. His liberalism giving umbrage to the government, he travelled in various parts of Europe, and was permitted to teach at the university of Berlin after his return in 1839. In 1848 he was appointed professor of general literature and history at Breslau, and in 1850 he became director of the library of the Berlin university. Among his earliest writings was *Madonna, oder Unterhaltungen mit einer Heiligen* (Leipsic, 1834); its morbid though poetical views of life are said to have prompted Charlotte Stieglitz to commit suicide from devotion to her husband, whom she hoped to divert from his varied troubles by the greater sorrow caused by her death. (See STIEGLITZ, HEINRICH.) Mundt edited her writings under the title *Charlotte Stieglitz, ein Denkmal* (Berlin, 1835). Among his subsequent works are a series of novels, including *Thomas Münzer* (Altona, 1841), and *Carmola, oder die Wiedertaufe* (Hanover, 1844); *Mendoza, oder der Vater der Schelme* (Berlin, 1847); and *Die Matadore* (Leipsic, 1850). He also published *Spaziergänge und Weltfahrten* (Altona, 1838-'40), *Völkerschau auf Reisen* (Stuttgart, 1840), and other sketches of travels, and a delineation of the character of Knebel in the edition of that author's posthumous works which he prepared in concert with Varnhagen von Ense. Among his other productions are *Kunst der deutschen Prosa*; *Allgemeine Literaturgeschichte*, in continuation of that of Schlegel; *Dramaturgie*; *Geschichte der Literatur der Gegenwart*, &c. His *Geschichte der Gesellschaft* (1844) was followed by a *Geschichte der deutschen Stände* (1854); and he published in 1851 a work on Machiavelli. In 1844 he began the publication of an edition of Luther's political works. His last work, *Rom und Neapel*, appeared in 1860. **II. Klara** (MÜLLER), best known by her pseudonyme of **LUISE MÜHLBACH**, a German novelist, wife of the preceding, born in Neubrandenburg, Jan. 2, 1814, died in Berlin, Sept. 27, 1873. She was married in 1839, and

in the same year published her first novel. The long series of romances which followed gained great popularity, and brought her a large fortune, enabling her to support her husband during the long illness which preceded his death, and to build a handsome residence in Berlin, where she was a prominent figure in literary society. Mme. Mundt was an advocate of female suffrage and of great changes in the social position of women, an extreme liberal in her political views, and a frequent participant in reform movements in these and similar directions. She wrote many essays on social questions. Her historical romances have been translated into English, and are as well known in Great Britain and America as in Germany. The facts of history are very freely treated in them, and the imagination of the writer is allowed full liberty; but the narratives are spirited, and the social features of the periods of which they treat are often fairly represented. The best known of these works are "Frederick the Great and his Court," "Joseph II. and his Court," "The Merchant of Berlin," "Frederick the Great and his Family," "Berlin and Sans-Souci," "Henry VIII. and Catharine Parr," "Louisa of Prussia and her Times," "Marie Antoinette and her Son," "The Daughter of an Empress," "Napoleon and the Queen of Prussia," "The Empress Josephine," "Napoleon and Blücher," "Queen Hortense," "Goethe and Schiller," "Andreas Hofer," "Prince Eugene and his Times," and "Mohammed Ali and his House." Among her latest works were "The Thirty Years' War," "Emperor William," and "From Königrätz to Chiselhurst," all published in 1873. She wrote in all more than 50 separate novels, comprising nearly 100 volumes.

MUNICH (Ger. *München*), the capital of Bavaria and of the district of Upper Bavaria, on the Isar, in the midst of an extensive plain, 1,700 ft. above the level of the sea, in lat. 48° 9' N., lon. 11° 35' E., 33 m. S. E. of Augsburg, 290 m. S. S. W. of Berlin, and 220 m. W. of Vienna; pop. in 1871, 169,478 (in 1812, 40,000). It is celebrated for its architectural splendor, for its admirable institutions and works of art, and for its university. The city is composed of the old and the new town and of five suburbs on the left bank and three on the right bank of the Isar. The river is spanned by four bridges, the Isar bridge being the largest and the Maximilian the finest and most recent. The number of streets is about 275, and new streets are springing up in every direction, particularly near the new railway stations in Haidhausen and other suburbs, and in the S. part of the city. The streets in the old town are irregular, but spacious and bustling. The most celebrated in the modern city are the Ludwig and Maximilian streets, which respectively contain the most remarkable public and private buildings. There are nearly 20 squares, of which the Max-Joseph is the largest; and others conspicuous for attractiveness are the Odeon, Wittels-

bach, Maximilian, Karl, and Promenade squares, the Carolinenplatz, and the Königsplatz. Favorite promenades are the Hofgarten and the English garden, the latter remarkable for a Greek temple and other embellishments. The S. continuation of it, known as the Hirschau, abounds with deer, stags, and pheasants; and N. of the park is the new zoological garden. Not far from Munich is the park adjoining the palace of Nymphenburg, and the picturesque scenery of the upper banks of the Isar makes many of the neighboring villages favorite resorts, while the immediate vicinity of the city teems with public gardens.—Munich contains upward of 20 Roman Catholic churches and chapels. St. Peter's, the oldest, dates from the 13th century. The Gothic cathedral (*Frauenkirche*), completed at the end of the 15th, has two lofty dome-capped towers. St. Michael's is remarkable for the beauty of the interior and for the width of its roof unsupported by pillars; it contains Thorwaldsen's monument of Eugène de Beauharnais. St. Cajetan's contains the tombs of the royal family. The modern edifices are however the most interesting. All Saints' chapel (*Allerheiligen-Kapelle* or *Hofkapelle*) has columns of red Tyrolese marble with white bases and gilded capitals. The upper part of the aisles is incrustated with colored marbles; all the rest is covered with frescoes upon a golden ground. The *Ludwigskirche*, in the round arch style, is also famous for the beauty of its execution and its designs, and for the wealth of its decorations, which comprise colossal statues of St. Peter and St. Paul and other works by Schwanthaler, and Cornelius's "Last Judgment," upward of 60 ft. high. The parish church of *Maria-Hilf*, in the Au suburb, and in the German pointed style of the 14th century, with high lancet windows, contains 19 painted windows illustrative of incidents in the life of the Virgin. The church or basilica of St. Boniface, finished in 1850, in the Byzantine style, is the largest and most splendid of them all. The front has a portico of eight Corinthian columns with three bronze doors. The side façades have a double row of round-headed windows. The interior, divided into a nave 75 ft. high and 50 ft. wide, and a number of aisles, is supported by 64 monolithic columns of marble disposed in four rows. The pavement is of marble mosaic, and the roof of open timber work, the beams of which are carved and richly decorated, and the ceiling between them azure with golden stars. The frescoes on the walls represent saints and martyrs and incidents in the life of St. Boniface.—The majority of the population are Roman Catholics, and an archbishop resides here. Munich has also recently become the great centre of the Old Catholic movement. There are about 16,000 Protestants, who have several places of worship. There is only one synagogue, Jews being less numerous here than in most other parts of Germany, numbering

barely 2,000. Charitable institutions are numerous; the most prominent are those for the blind and deaf and dumb, and the new lunatic asylum in the Au suburb. The penitentiary, or great prison, in the same locality, is one of the most remarkable establishments of the kind in Germany, resembling a manufactory in which every handicraft is carried on, the prisoners, male and female, being obliged to work at their respective trades. Among the finest official buildings are the war and post offices, the mint, the office of the mining and salt works, and the renovated city hall (*Rathhaus*).—The Ludwig-Maximilian university, founded in Ingolstadt in 1472, and in 1800 transferred to Landshut, was removed to Munich in 1826, and has since attained world-wide celebrity, particularly under the reign of Maximilian II. (1848-'64). The 400th anniversary of its foundation was celebrated in 1872. In the winter term of 1874-'5 it was attended by 1,145 students, including 80 in Roman Catholic theology, 223 in jurisprudence, &c., 307 in medicine and pharmacy, and 432 in philosophy. Connected with it were 113 professors, one of whom is Dr. Döllinger. Attached to the university, which occupies a new and imposing edifice, are the Georgianum or theological school, a philological seminary, anatomical and clinical institutions, and the general hospital. The royal polytechnic school, founded within the last generation, has rapidly risen to great importance, and was attended in 1875 by upward of 1,300 students. A fine building was appropriated in 1863 for an athenæum for training young men for the civil service, and contains Kaulbach's "Battle of Salamis," one of 100 paintings illustrating universal history. There are many other educational institutions in Munich, extending over every specialty of military and civil instruction, and including a Catholic normal seminary. The libraries of Munich are extensive and numerous. The most celebrated is the royal or public library (*Hof- und Staatsbibliothek*), a splendid building in the Ludwig street, resembling an Italian mediæval palace, and containing a reading room, 900,000 volumes, and 22,000 manuscripts, the books from suppressed monasteries greatly contributing to swell the number. Next in extent is the university library, with 230,000 volumes and 2,000 manuscripts. The academy of sciences is rich in scientific collections, and has jurisdiction over the cabinet of antiquities in the old royal

palace, the chemical laboratory established by Liebig, the botanic garden and the new palm house, and the observatory and meteorological bureau, near the neighboring village of Bogenhausen.—The academy of fine arts, including the Schwanthaler and other museums, is devoted to architecture, sculpture, drawing, and engraving. Piloty succeeded Kaulbach as president in 1874. A plot of ground near the Siegesthor was in 1874 purchased by the government for the erection of a new building for the academy. The Glyptothek or sculpture gallery is surrounded by pleasure grounds, and consists of 12 halls named after the statues which they contain. The 1st is filled with Egyptian sculptures, and the 2d with the earliest Greek and Etruscan; the 3d with Æginetan antiquities, which are especially celebrated for the marbles discovered in 1811 and restored by Thorwaldsen; the 4th (the hall of Apollo) is devoted to the works of Phidias; the 5th

The Glyptothek.

(hall of Bacchus) contains the sleeping or Barberini faun, and other famous works; the 6th (hall of the sons of Niobe) is remarkable for a kneeling figure of Ilioneus, the youngest son of Niobe; the 7th (hall of the gods) is devoted to heathen mythology, and the 8th (Trojan hall) to the heroes of Homer; in the 9th (hall of heroes), are statues of Alexander the Great and Nero; the 10th (Roman hall) is remarkable for its decoration, and contains busts which exhibit the decline of Roman art; the 11th is the hall of colored sculpture; and the 12th is that of modern statuary, containing Thorwaldsen's Adonis and bust of King Louis I. The Pinakothek or picture gallery, a more extensive building than the Glyptothek, like the latter designed by Klenze, was completed in 1836. It contains about 1,300 paintings, consisting of the best works of the royal collections, arranged according to schools in 9 halls and 23 compartments, the large works of each school being placed in the central hall, which

communicates on one side with the collections of the smaller paintings, and on the other with an extensive corridor, divided into 25 *loggie*, adorned with frescoes by Cornelius illustrative of the history of the fine arts during the middle ages. Cimabue, Giotto, Leonardo da Vinci, Correggio, Titian, Michel Angelo, Albert Dürer, Rembrandt, and Vandyke are here represented, some of them by numerous works. An entire compartment is filled with those of Raphael, and 95 works of Rubens take up the entire space of the central and largest hall of the gallery. Murillo, Poussin, and other Spanish and French painters are also represented. The lower story contains collections of 9,000 drawings by the old masters, including some of Raphael, the drawings of Cornelius for the *loggie*, and 3,000 drawings of South American scenery by Rugendas. The cabinet of engravings comprises about 300,000 works. On the ground floor of the W. wing is a collection of Etruscan and other vases. On the north is the new Pinakothek, completed in 1853, destined for the works of contemporary artists, and comprising 52 rooms in two stories. The upper floor, which contains them, is divided into 5 large central halls, 5 rooms on the south and 14 small cabinets on the north, besides a room at the west with Rottmann's encaustic illustrations of Grecian history and sites. In the central hall are Kaulbach's "Destruction of Jerusalem" and Schorn's "Deluge." It contains also Wilkie's "Reading of the Will." On the ground floor are paintings on porcelain, with copies of the most celebrated works of the picture gallery. In the old picture gallery on the N. side of the royal park is a collection of antiquities and curiosities from different parts of the world. The Leuchtenberg gallery of paintings was removed to St. Petersburg in 1853. The new royal palace (*der neue Königsbau*) is a magnificent and stupendous extension of the old palace. The interior is embellished after the model of the *loggie* of the Vatican. The ground floor consists of state rooms decorated with Schnorr's *Nibelungen*. The kings' and queens' apartments are adorned with paintings respectively from Greek and German poets. Other apartments are devoted to Klopstock, Wieland, Goethe, Schiller, and Tieck. The most interesting part of the palace is the *Festsaalbau*, containing on the E. side of the ball room two rooms for card playing called halls of the

beauties, with portraits of beautiful women of modern times, including Lola Montez. The banquet hall and the halls of Charlemagne, Barbarossa, and Rudolph of Hapsburg are full of fine decorations, the throne room being the most gorgeous of all. Among other royal residences are the Wittelsbach palace and the palaces of Prince Max and Prince Luitpold, the latter formerly known as the Leuchtenberg palace, situated on the Odeon square, opposite to the fine bazaar celebrated for its arcades; and there are several private mansions of remarkable architecture. The Bavarian national museum, completed in 1866, about 500 ft. long and 95 ft. high, contains varied and interesting collections relating to Bavarian antiquity, history, and manufactures, and the walls are decorated with many frescoes of stupendous size. There are various other buildings used as museums and for exhibitions of ancient and modern art, of which latter

The Ruhmeshalle.

Munich contains a greater number than any other place of its size, the so-called crystal palace in the old botanic garden being the most extensive. Some of the city gates, as the *Siegesthor* (the triumphal arch), after the model of the arch of Constantine, and the *Isarthor*, are exceedingly interesting, as well as the Propylæum, a triumphal arch in the old Doric style, with bass reliefs, commemorating the modern Greek war of independence and King Otho. The *Ruhmeshalle* (hall of fame) is the most conspicuous monument of Munich. It is situated on high ground in the Theresienwiese, and consists of a large Doric portico of Bavarian marble, forming three sides of a quadrangle and an open side, in the centre of which rises Schwanthaler's colossal bronze statue of Bavaria, about 100 ft. high, including the pedestal. There are 48 columns with busts of eminent Bavarians. In the tympana are female statues representing Bavaria, the Palatinate, Swabia, and Franconia; and in the frieze are

upward of 90 metopes, adorned with figures of Victory and with reliefs symbolical of the arts and occupations of civilized society. The principal squares and streets are adorned with monuments of Bavarian monarchs, some of them of colossal size, especially the equestrian statute of Louis I. on the Odeon square, and that of Maximilian II., erected in 1874. Goethe, Schiller, Gluck, and other eminent men are likewise honored here by monuments; and among the most recent are those of Liebig and Kaulbach. In the southern cemetery and the adjoining new cemetery are also interesting monuments; the former contains a house (*Leichenhaus*) for funeral exposition of the dead, and the latter has a fine *campo santo*, in the mediæval Lombard style, consisting of a large square enclosure, surrounded by an elegant structure of brick. The opera house of Munich, the concerts in the Odeon and other places, and the conservatory of music are among the best in Germany; the royal school of music was attended in 1874-'5 by 59 female and 45 male pupils. There are several theatres for dramatic performances, the most recent being the *Volkstheater* for popular plays and also for operettas.—There were seven railway stations in 1874. The lines to Paris and Vienna and to Italy form here a main junction, making Munich a great centre of travel, especially in summer, and of increasing trade and industry. In 1874 there were nearly 200 manufactories of various articles. The most celebrated establishments are the breweries; the royal bronze founderies, where Crawford's statues of Beethoven and Washington, and the doors of the capitol at Washington, were cast; the royal glass and porcelain works, Maffei's manufactory of machinery, Mannhardt's of steeple clocks, and Ertl's of technological instruments (which was founded by Reichenbach); Fraunhofer's and Utzschneider's optical works, continued by März and sons; and photographic and xylographic establishments. The staple article of trade is grain, and there are two great annual fairs (*Dulten*). Granaries, a cattle market, and an abattoir have been built near the railway stations, where new establishments spring up in increasing numbers.—Munich was originally a settlement of monks (*Mönche*), whence the name, which was first mentioned early in the 12th century; and Henry the Lion raised the *Villa Municha* to some importance (1158). It became the residence of the dukes of the house of Wittelsbach, and was much enlarged after its destruction by fire in 1327, and endowed with many public buildings by Duke William the Pious (1579-1596) and the duke and elector Maximilian I. (1596-1651). On May 17, 1632, it was taken by Gustavus Adolphus of Sweden, and held for some time. Under Charles Theodore (1777-'99) Munich was greatly improved and enlarged. It was entered by a division of the French army under Moreau in June, 1800, and in October, 1805, by Napoleon, who again visited the city

in January, 1806, on occasion of the marriage of Eugène de Beauharnais. Munich from an inferior town has risen under the fostering care of King Maximilian I. (died in 1825), and particularly under that of his son Louis I., to the rank of an important capital. While still crown prince Louis ordered the building of the Glyptothek and of other public works, and he contributed most powerfully to invest Munich with its present splendor, and continued his exertions for the embellishment of the capital even after his abdication in 1848. Under his son Maximilian II. arose the magnificent street and bridge which bear his name, and many remarkable institutions and works of art. His influence on science was great, and he gave to the university the benefit of the services of Liebig and other eminent men, and encouraged poets and literary men generally. The present king, Louis II., is chiefly interested in music, but proposed in 1874 to endow Munich with a palace and museum after the model of Versailles.

MUNJEET, the commercial name for the root of an East India plant, *rubia munjistia*, or according to some of *R. cordifolia*, used for the same purposes as madder. The roots are of similar appearance to those of madder, but are thinner and much longer, and are found in commerce in bundles 2 or 3 ft. long, and as thick as one's wrist. The coloring principle appears to be alizarine, and, as in madder, this is convertible into garancine, for which purpose the roots are used in Europe. Munjeet dyes a very bright scarlet.

MUNK, Salomon, a French orientalist, born of Jewish parents in Glogau, Prussian Silesia, May 14, 1805, died in Paris, Feb. 6, 1867. He was educated in Berlin and Bonn, and afterward studied the oriental languages in Paris. In 1835 he visited the university of Oxford, with a view of collecting materials for an edition in the original Arabic text in Hebrew letters of the celebrated work of Maimonides, *Moreh nebukhim* ("Guide of the Perplexed"), which he published with a French translation and notes under the title of *Le guide des égarés* (3 vols., 1856-'66). In 1840 he was appointed deputy custodian of the oriental manuscripts in the royal library of Paris. In the same year he accompanied Sir Moses Montefiore and Crémieux to Egypt, where he secured many interesting Arabic manuscripts. In 1852 failing eyesight compelled him to relinquish his office in the library, but, with the assistance of friends, he still pursued his studies. In 1865, though entirely blind, he was appointed professor of the Hebrew, Chaldaic, and Syriac languages in the collège de France. He wrote *Palestine, description géographique, historique et archéologique* (Paris, 1845, included in Didot's *Univers pittoresque*). A portion of his contributions to the *Dictionnaire des sciences philosophiques*, on Arabic and Hebrew philosophy, has been translated into German under the title of *Philosophie und philosophische Schriften der Juden*

(Leipsic, 1852). He also published *Réflexions sur le culte des anciens Hébreux dans ses rapports avec les autres cultes de l'antiquité* (1833), and other works; and prepared a *Cours de langue hébraïque, chaldaïque et syriaque* (1865).

MUNKÁCS, a town of N. E. Hungary, in the county of Bereg, on the Latorcza, 67 m. E. S. E. of Kaschau; pop. in 1870, 8,602. E. of it, on a high rock, is the fortress of the same name, remarkable for numerous sieges, and formerly used by the Austrians as a state prison. Among the prominent prisoners confined there was Alexander Ypsilanti. During the war of 1848-'9 the town and fortress were in the hands of the Hungarians. It has large iron and saltpetre works.

MÜNNICH, Burkhard Christoph, count, a Russian soldier, born in the then Danish duchy of Oldenburg, May 20, 1683, died in St. Petersburg, Oct. 27, 1767. He was the son of a peasant ennobled by Frederick III. of Denmark, and early distinguished himself. He was made a prisoner in the battle of Denain, and sent to Cambrai, where he was very kindly treated by Fénelon. In 1720 he was received with distinction by Peter the Great, who confided to him the execution of the great Ladoga canal. In the reign of Anna he became field marshal and president of the council of state. He reduced Dantzic in 1734. In 1735 he was called to the chief command of the army against the Turks, and gained distinction by his victories. He desolated the Crimea (1736), took Otchakov (1737), defeated the Turks near Stavutshay (1739), seized the fortress of Khotin, and occupied Moldavia. The treaty of Belgrade (Sept. 18, 1739) put an end to the war. Previous to the death of the empress he prevailed upon her to appoint the duke Ernest Biron of Courland as regent during the minority of her successor. But his hope of securing in this manner his own influence was disappointed by the duke taking the power into his own hands, upon which Münnich caused him to be arrested, and transferred the regency nominally to Princess Anna, the mother of Ivan, the young presumptive heir to the crown, while he assumed the reins of government as prime minister of the empire, endeavoring to consolidate his power by an alliance with Prussia. The regent Anna lavished upon him her bounties, but entered into negotiation with Austria and Saxony in order to neutralize Münnich's coalition with Prussia, in consequence of which he relinquished his office (May, 1741). He was on the point of removing to Königsberg, when on the accession of Elizabeth (December) he was arrested by her order and sentenced to death. The sentence was commuted to exile to Siberia, but his estates were confiscated. In 1762 he was recalled by Peter III., who restored his property and position. Catharine II. appointed him in the same year director general of the Baltic ports. His *Ébauche pour donner une idée de la forme du gouvernement de l'empire de Russie* was published at Copenhagen in 1774.

MUÑOZ, Fernando, duke of Rianzares, husband of Maria Christina, ex-queen dowager of Spain, born at Taranco, province of Cuenca, about 1808, died near Havre, Sept. 13, 1873. He was of low birth, and while a private in the royal guards attracted by his personal beauty the admiration of Maria Christina, to whom he was secretly married, Dec. 28, 1833, three months after the death of her husband, King Ferdinand VII. The marriage was publicly solemnized, Oct. 13, 1844, and Muñoz was made duke of Rianzares, a Spanish grandee of the first class, and a knight of the golden fleece. On the marriage of the duke de Montpensier to the sister of Queen Isabella II., Louis Philippe bestowed upon Muñoz the French title of duke of Montmorot. On the expulsion of Maria Christina from Spain in 1854 he went with her to France, and subsequently resided with her at Malmaison and in Paris.

MUNRO, Alexander, an English sculptor, died young in Cannes, France, Jan. 1, 1871. He executed the colossal statue of James Watt at Birmingham, the statue of Queen Mary now in Westminster hall, London, a fountain nymph in Berkeley square, and statues of Hippocrates, Galileo, Davy, and Watt in the Oxford museum. He excelled in medallion portraits in high and low relief, and also in the busts of females and children. His works are generally remarkable for gracefulness, delicacy, and picturesqueness.

MUNSEES, Monseys, or **Minis**, a tribe of American Indians formerly residing on the upper Delaware and the Minisink. In 1663 they aided the Esopus Indians in attacking the Dutch post, and were chastised by Kregier. They claimed all the land from the Minisink to the Hudson, the head waters of the Delaware and Susquehanna, and south to the Lehigh and Conewago. Settlers began to encroach on them early in the 18th century, and they fell back to the Susquehanna. The Moravians drew some to their missions, but the main body were discontented; moving westward through the Iroquois country, they joined the French at Niagara, and were with difficulty gained over by Sir William Johnson. After the fall of the French, some listened to the Moravians, but in the revolution most of the tribe, under Capt. Pipe, retired to Sandusky and joined the English, and even after the war remained hostile, rejecting terms in 1793, and not making peace till 1805. In 1808 a part settled on Miami land at White river. Some years later they joined the Stockbridge Indians near Green bay. Most of the Munsees, under a treaty in 1839, removed to Kansas. They are now nearly extinct, being represented in Wisconsin by a single family of half a dozen souls, and in Kansas by part of a band of 56 Chippewas and Munsees. Their language was an Algonquin dialect closely allied to the Delaware.

MUNSELL, Joel, an American printer, born in Northfield, Mass., April 14, 1808. He went to Albany in 1827, edited and published the "Albany Minerva" in 1828, and was publisher

and editor of the "New York State Mechanic" from 1841 to 1843. He has compiled "Annals of Albany" (10 vols., Albany, 1850-'58); "The Typographical Miscellany" (1850); "Chronology of Paper and Paper Making" (1857); and "Every-Day Book of History and Chronology" (New York, 1858). He has also published "Historical Series" (10 vols.), in great part edited and annotated by himself; "Woodworth's Reminiscences of the City of Troy;" and "Collections on the History of Albany" (4 vols., 1865-'71), and numerous other works. He has at various times been the publisher of papers and periodicals, among which are the following dailies: the "Unionist," "Albany Daily State Register," "Albany Morning Express," and "Statesman." He has made the art of printing, in its history and application, a special study, and his collection of works on the subject, the largest ever made in America, has been in part purchased by the state for the New York state library. In 1872 he published a catalogue with full titles of all the books and pamphlets he had printed down to that date, in 191 closely printed brevier pages, 8vo.

MUNSTER (anc. *Mumhan*), the largest and southernmost of the four provinces of Ireland, bounded N. by Connaught, N. E. by Leinster, and on other sides by the Atlantic, and comprised between lat. 51° 26' and 53° 12' N., and lon. 6° 56' and 10° 26' W.; area, 9,272 sq. m.; pop. in 1871, 1,390,402. In the west are the highest mountains in Ireland, and the south is crossed by long chains of hills. Three fourths of the surface is arable, and one fourth under tillage. The principal rivers are the Suir, Blackwater, Lee, Bandon, Cashen, Maigue, and Fergus, with the estuary of the Shannon, all of which are navigable. The principal lakes are those of Killarney. Except in the rugged uplands of Kerry, Clare, and western Cork, the limestone soil of Munster is excellent. The climate is the most genial in Ireland. Geologically, the province is peculiar in Ireland for the rare appearance of igneous protrusions and the absence of bituminous coal, though possessing perhaps the most extensive anthracite deposit in the British isles. Clay slate is found, and copper abounds all along the S. coast. Lead, silver, iron, alum, black and mottled marbles, plastic clays, and fine ochres are found. The province comprises the counties of Clare, Cork, Kerry, Limerick, Tipperary, and Waterford.—As a kingdom of the Irish pentarchy, Mumhan was perhaps the most formidable of the five states; it early subjected Leinster to the payment of an annual tribute; its princes successfully opposed and ultimately expelled the Danes, and more than once usurped the sceptre of Tara as sovereigns of the entire island. It was then divided into three principalities, Thomond, Desmond, and Ormond (*i. e.*, North, South, and East Munster), and Cashel was the civil, as it is still the ecclesiastical, metropolis. During the rebellions in the

time of Queen Elizabeth Munster was governed through a local president and council.

MÜNSTER, a city of Germany, capital of the Prussian province of Westphalia and of a district of its own name, on the small river Aa, connected by railway with Düsseldorf, and with the river Ems by a canal, 76 m. N. N. E. of Cologne; pop. in 1871, 24,815. It has fine Gothic buildings, the ground floor of the houses of the main street being provided with arcades to support the upper stories. Among the remarkable public buildings are the cathedral, of the 13th century, and St. Lambert's church. The house of John of Leyden, a fine specimen of the Gothic, still exists in the market place. The treaty of Westphalia, which ended the thirty years' war, was signed here in 1648. The town house was renovated in 1860, and a grand Gothic hall was added. The churches of St. Maurice and St. Leger have also recently been renovated. The Catholic university, which was supplanted in 1818 by the state university of Bonn, has been since reduced to an academy consisting of a theological and a philosophical faculty, which in 1873 had 28 professors and 387 students. There are also a gymnasium, a library of 50,000 volumes, a number of minor Roman Catholic churches and convents, a Protestant church, and a synagogue. The city is the seat of a bishop, and contains several learned societies. The manufactures consist of leather, woollen goods, cloth, linen, sugar, &c.—Münster was known in the time of Charlemagne under the name of Mimi-gardevord. In the 13th century it joined the league of the Hanse towns. The reformation was introduced in 1532, and in 1533-'5 it witnessed the agitations of the Anabaptists. (See ANABAPTISTS.) The former bishopric of Münster was raised in the 12th century to the rank of an imperial principality. Among the prince-bishops was the warlike Galen. (See GALEN.) In 1719 the archbishop of Cologne was invested with the see of Münster. After the peace of Lunéville (1801) the bishopric was secularized, and a part of it ceded to Prussia, which constituted it a principality. This was ceded to France by the treaty of Tilsit in 1807, but restored to Prussia in 1815, with the exception of a small district allotted to Oldenburg.

MÜNTER. **I.** Balthasar, a German clergyman, born in Lübeck, March 24, 1735, died in Copenhagen, Oct. 5, 1793. He studied theology at Jena, was for a time a preacher at Gotha, and became celebrated as a pulpit orator in the German church of Copenhagen, and as the author of the *Bekehrungsgeschichte des Grafen von Struensee* (Copenhagen, 1772; English translation, "A Faithful Narrative of the Conversion and Death of Count Struensee," &c., by the Rev. Mr. Wendeborn, 2d ed., London, 1774). He wrote a series of hymns (1773 and 1774). He was the father of Friederike Brun. **II.** Friedrich, a German-Danish theologian and archaeologist, son of the preceding, born in Gotha, Oct. 14, 1761, died in Copenhagen,

April 9, 1830. He was professor of theology at Copenhagen, and from 1808 till his death bishop of Seeland. He wrote several books on the history of Christianity and of the reformation in Denmark and Norway, and critical works on the cuneiform inscriptions of Persepolis (1800), on similar inscriptions in Sicily (1802), on the religion of the Carthaginians (1816), and various other topics of ancient and mediæval history.

MUNTJAC (*cervulus*, De Blainv., or *styloceras*, H. Smith), the name of several small East Indian deer, which seem to make the transition from the typical *cervidæ* to the musk deer. The horns are small, with only one anterior snag, elevated on pedicels supported by longitudinal ridges on the face; there are large canines in the upper jaw, and large and deep suborbital pits; there are no metatarsal glands nor tufts; the hoofs are triangular, partly united in front by a web, and the false hoofs small and transverse; the hair is thin, shining,

Muntjac (*Cervulus vaginalis*).

and generally unspotted, and the tail is tufted; the form is light and elegant. The few species inhabit the forests and jungles of elevated regions in India and its archipelago, where they are hunted for their excellent venison. The common muntjac or kijang (*C. vaginalis*, Gray) is dark reddish brown, with the lower parts lighter, and a narrow white streak on the front edge of the thigh; it is about $2\frac{1}{2}$ ft. high at the shoulders; in the living animal there are two folds of skin along the sides of the ridges which support the horns, uniting below like a V, but drying after death in three ribbed lines, which suggested to Pennant the name of rib-faced deer. The principal horns are 4 or 5 in. long, at first straight, but curving inward and backward at the top, the anterior antler being about $1\frac{1}{2}$ in.; the pedicels upon which they rest are 3 in. high, covered with skin and hair, so that when the antlers are shed they appear to have straight horns. The food consists chiefly of a kind of sugar cane, and malvaceous and succulent plants. Its speed and agility are

great, the flight being generally in a circle; when brought to bay, it is capable of inflicting severe wounds upon the dogs with its canines; it is sometimes taken in snares, and falls a frequent victim to beasts of prey. It is found in Sumatra and Java. The Nepaul muntjac (*C. moschatrus*, De Blainv.) is bright reddish yellow, the thigh streaked and under the tail white, and the chin and throat whitish. The Chinese muntjac (*C. Reevesii*, Gray) is grayish brown, with the hair short, with paler rings; it has a larger head and tail than the common species, with less red and more bluish tinge, and no white over the hoofs. According to Gray, the earl of Derby had these three species at the Knowsley menagerie; but they so bred together that it became "impossible to discriminate the mules from the original species."

MÜNZER, Thomas, a German mystic, born at Stolberg in the Hartz mountains about 1490, beheaded at Mühlhausen, Thuringia, in May, 1525. After preaching at various places, in 1520 he became pastor of the principal church in Zwickau, Saxony. Here he associated himself with Nikolaus Storch, a weaver, who professed to receive divine revelations. They formed a society among the weavers separate from the church, whose members believed in dreams, visions, and divine inspirations. They soon gained such an influence that Münzer's co-pastor Egranus, who opposed him, was obliged to leave the city. The city council, who for a time had favored Münzer, finally considered his revolutionary views dangerous to the public peace, and imprisoned many of his adherents. Others, among whom was Storch, fled to Wittenberg, where they still professed to receive inspirations, and rejected infant baptism. Münzer went to Bohemia, where he spent six months endeavoring to stir up reformatory movements. Meeting with little success, he went to Thuringia, married, and in 1523 became curate at Allstädt. He was the first to substitute the German language for the Latin in the public prayers and singing. He composed a directory for worship, which was in harmony with his ideas of the reformation. Infant baptism was to be administered in the presence of the church, instead of privately as before, the baptismal liturgy to be in German. Besides his public ministrations, he organized those whom he considered truly regenerated into a separate society, whose members held community of goods and aimed at the overthrow of hierarchy and despotism. Their fanaticism soon led them to destroy the images and burn the chapel in a neighboring place of pilgrimages. The Saxon princes opposed these proceedings; Luther also wrote against them; and Münzer was obliged to leave Allstädt in the summer of 1524. He went to Nuremberg, where he wrote a violent pamphlet against Luther; then to Basel, where he conferred with Ecolampadius; then to Waldshut, where he exerted considerable influence on the men who soon afterward began the peasants' war. Re-

turning to Thuringia, he was settled early in 1525 as curate at Mühlhausen. The city council, who had opposed his settlement there, were deposed, and a new council installed, who were entirely under the control of Münzer and his disciple Pfeiffer. At the outbreak of the peasants' war in southern Germany, Münzer summoned the people to rise and secure their liberty, threatening vengeance on all who resisted them. His pamphlets and letters were signed "Thomas Münzer, a servant of God against the ungodly," or "Thomas Münzer, with the sword of Gideon." Still he himself hesitated to take up arms, until Pfeiffer forced him to do so by alleged inspiration. Led by him, the peasantry of N. W. Thuringia destroyed cloisters, chapels, and the castles of such nobles as refused to engage in the insurrection. For some time they encountered little resistance, until in May the elector John the Constant and Duke George, both of Saxony, the landgrave Philip of Hesse, and other princes rallied their forces against them. The peasants, in their fortified encampment near Frankenhäusen, were assured by Münzer that God would give them the victory; but they were quickly routed in the battle of May 15, and about 5,000 of them were killed. Münzer fled in disguise to Frankenhäusen, but was captured, tortured, and removed to the castle of Heldrungen. From that place he addressed a letter to the people of Mühlhausen, recommending his wife and child to their care. After the capitulation of that city the leaders were sentenced to death, including Münzer and Pfeiffer. Münzer was beheaded in the market place. His numerous writings, all of which are still extant, indicate a more than ordinary power of mind and will, but a strange lack of clear and sound judgment. His language is often forcibly eloquent, but full of coarseness and vulgarity. As he was associated with persons opposed to infant baptism, Münzer has often been considered an Anabaptist, which he never was.—See Melancthon, *Die Historie von Thome Muntzer* (1525); Strobel, *Leben, Schriften und Lehren Thomä Muntzers* (Nuremberg, 1795); Seidemann, *Thomas Münzer* (Dresden and Leipsic, 1842); and Heinrich Leo's essay on him in the *Evangelische Kirchenzeitung* (Berlin, 1856). Theodor Mundt published a historical novel, *Thomas Münzer* (3 vols., Altona, 1841).

MUNZINGER, Werner, a Swiss traveller, born at Olten in 1832, died in November, 1875. He studied at Bern, Munich, and Paris, in 1852 engaged in trade in Egypt, in 1854-'5 resided at Massowah, and for some years explored the land of the Bogos and adjoining territories. He joined Heuglin's expedition in July, 1861; left it in November, in northern Abyssinia, and travelled with Kinzelbach over an unexplored region, ascertaining the course of the river Gash, and returning to Khartoom March 1, 1862. Shortly after he succeeded Heuglin as chief of the German-African expedition. He penetrated to Kordofan, but was unable to

reach Darfoor and Waday, and went to Europe. In 1864 he returned to Massowah, where he became British consul, and rendered valuable services as a guide to the English army during the Abyssinian war. In 1868, after the departure of the English troops, he continued to reside at Massowah as French consul. In the following year, while he was exploring the N. boundary of Abyssinia, an attempt was made upon his life by an assassin, and he was severely wounded. In 1870 he was named governor of Massowah, and from 1872 commanded against the Abyssinians and the African tribes, and was killed in a battle with the Gallas. His principal works are: *Sitten und Recht der Bogos* (Winterthur, 1859); *Ostafrikanische Studien* (Schaffhausen, 1864); *Die deutsche Expedition in Ostafrika* (Gotha, 1865); *Vocabulaire de la langue Tigré*; and contributions to the journal of the London geographical society (1871-'2), and to Petermann's *Mittheilungen* (1872 et seq.).

MURAD. See AMURATH.

MURÆNA. See EEL, vol. vi., p. 447.

MURAT, Joachim, a French soldier, and king of Naples, born at La Bastide-Fortunière, near Cahors, March 25, 1771, executed in Calabria, in the night of Oct. 13-14, 1815. He was the son of an innkeeper, was educated for the church at the college of Cahors, and afterward at Toulouse, and was ordained sub-deacon; but being dismissed from the seminary on account of some youthful follies, he enlisted in a regiment of chasseurs. Cashiered for an outbreak of temper after he had risen through some of the lower grades, he became a waiter at a café in Paris. He soon entered the constitutional guard of Louis XVI., and on its dissolution received a sub-lieutenancy in a cavalry regiment. He was cashiered after Robespierre's overthrow, but was restored, served as aide-de-camp to Bonaparte, and accompanied him to Italy. After Beaulieu's defeat he was sent to Paris with the 21 standards taken from the Austrians, and returned to his post to share in the following Italian campaigns, in which he rose to the rank of brigadier general. In 1798 he went with Bonaparte to Egypt. He was wounded at the taking of Alexandria and in the battle of the pyramids, and was conspicuous in the Syrian campaign, contributing to the victory of Mount Tabor, April 16, 1799, and leading the assault at Acre. In the battle of Aboukir, July 25, he was again wounded, and was rewarded with the rank of general of division. He left Africa with Bonaparte, who had conceived a strong liking for him, and in the *coup d'état* of the 18th Brumaire was at the head of the grenadiers who expelled the council of 500 from their hall at St. Cloud. The chief command of the consular guard and the hand of Caroline Bonaparte were his recompense. At Marengo he was at the head of the cavalry, and in 1801 he commanded the army which invaded the kingdom of Naples and took possession of Elba. He was then

made governor of the Cisalpine republic, and in 1804 of Paris and member of the legislative body; and on the establishment of the empire he received the baton of a marshal and the title of prince. He had a large share in the success of the campaign of 1805 in Germany, and led the cavalry at Austerlitz. In 1806 he was made grand duke of Berg and Cleves. His abilities were strikingly displayed in the battles of Jena, Eylau, and Friedland, and still more in following up the results of these victories. In 1808 he commanded the army which invaded Spain. After the elevation of Joseph Bonaparte to the Spanish throne he went to Italy, where, on Aug. 1, 1808, he was proclaimed king of the Two Sicilies, under the name of Joachim Napoleon. He attempted to ameliorate the condition of his new subjects, encouraged agriculture and industry, improved the public finances, increased the navy, and organized an army 70,000 strong. To vindicate the independence of Naples, he ordered that all foreigners in his service should renounce allegiance to their native country. This edict, aimed especially at the French, called forth an imperial decree declaring that, the kingdom of Naples being part of the French empire, every Frenchman should be of right a citizen of the Two Sicilies. The king then listened to overtures from various European powers, particularly Austria. He durst not, however, disregard Napoleon's summons to take part in the campaign against Russia, and was intrusted with the supreme command of the cavalry. At Borodino he withstood the Russian fire during the whole day. But his energy seemed to falter when the retreat from Moscow commenced, especially after he had been worsted at Vinkovo, Oct. 18, 1812. He however received the chief command of the army when, after the disastrous crossing of the Beresina, Napoleon left it in haste for Paris. But Murat proved unequal to his arduous task; he was anxious to return to Italy, and on Jan. 16, 1813, suddenly took his departure. He resumed his secret negotiations with the enemies of Napoleon, but joined his brother-in-law in the campaign of 1813, and displayed his wonted intrepidity again at Dresden, Wachau, and Leipsic. On his return to Italy he signed, Jan. 11, 1814, a treaty with Austria, by which his kingdom was guaranteed to him, on condition that he should act in concert with the allies at the head of an army of 30,000 men. He accordingly marched against Prince Eugène, viceroy of Italy, and forced him to retreat toward the Adige. But his new allies, having used him, were ready to abandon him, while the Bourbons were insisting on his overthrow at the congress of Vienna. On hearing of this, he sought the support of the Italian patriots, was secretly reconciled with Napoleon, and on the news of the latter's return from Elba marched against the Austrians. He advanced through the Papal States to the banks of the Po; but being worsted at Fer-

rara, he was forced to beat a hasty retreat; fought bravely, but ineffectually, May 2 and 3, at Tolentino; was driven in disorder along the sea and across the Apennines, made an ineffectual stand at San Germano and Mignano, and finally saw his army wasted away by battle and desertion. He now attempted negotiation; but, deserted by even his own emissaries, and the populace of Naples rising in insurrection, he was obliged to fly to Ischia, while his queen took refuge on board an English frigate. From Ischia he went to the shores of Provence, where he arrived on May 25 at night. After the battle of Waterloo, in which he was not allowed to share, he went to Piacenza, where he remained for two months, and then to Bastia, where he landed Aug. 25. Here he prepared an expedition, and on Sept. 28, at the head of 250 men, with seven small transports, he set sail for Naples; his squadron was scattered by foul weather, while he himself with a few companions was driven to the gulf of Santa Eufemia. He landed on Oct. 8 near Pizzo, attempted in vain to rouse the inhabitants of this village in his behalf, was pursued to the mountains by the peasants of the neighborhood, and fought to the last, but finally fell into the hands of his pursuers and was taken to the castle of Pizzo, where he was condemned by a court martial, and shot in one of the rooms of the castle. Being offered a chair and a handkerchief to bandage his eyes, he replied: "I have braved death long and often enough to face it with my eyes open and standing." Léonard Gallois published a *Histoire de Joachim Murat* (Paris, 1828); and the later events of his career have been chronicled by Coletta, *Les six derniers mois de la vie de Murat* (1821), and by Franceschetti, *Mémoires sur les événements qui ont précédé la mort de Joachim I.* (1826).—By his wife Caroline (see BONAPARTE, vol. iii., p. 26), Murat left two sons and two daughters. Both the latter married Italian noblemen, Lætitia Josephine becoming Countess Pepoli, and Louise Julie Caroline, Countess Rasponi. The elder son, NAPOLÉON ACHILLE, born Jan. 21, 1801, after his father's death went with his mother to Haimburg, Austria, came in 1821 to the United States, settled in Florida, married a grandniece of Washington, devoted himself to scientific pursuits, and wrote some essays on the institutions of America. He died April 15, 1847, on his estate near Tallahassee. The younger, NAPOLÉON LUCIEN CHARLES JOSEPH FRANÇOIS, born in Milan, May 16, 1803, after living near his mother till 1825, went to Spain, where he was arrested on suspicion. After his liberation he came to the United States, and married a Miss Fraser, his wife earning a support by teaching. After repeated short stays in France, he returned thither in 1848, and was elected to the constituent and legislative assemblies. He was envoy extraordinary and minister plenipotentiary to Turin in 1849, became senator Jan. 25, 1852, and received the title of prince of the imperial family in 1853. In

1860, when the Bourbons were expelled from Naples, Murat put forth his claims to the throne of the Two Sicilies; but at the instance of Napoleon III. he soon publicly disclaimed his pretensions. In 1870 he was with Bazaine in Metz, and when the city capitulated was made prisoner. He died April 11, 1878. His eldest son, JOSEPH JOACHIM NAPOLEÓN, born in Paris, July 21, 1834, is a colonel in the French army, and in April, 1872, obtained leave to serve four years in the Swedish army.

MURATORI, Ludovico Antonio, an Italian scholar, born at Vignola, in the duchy of Modena, Oct. 21, 1672; died in Modena, Jan. 23, 1750. He was educated at the university of Modena, was ordained priest, and in 1694 was appointed keeper of the Ambrosian library at Milan, where he discovered several inedited Latin and Greek manuscripts, selections from which, with notes and commentaries, he published under the titles of *Anecdota Latina* and *Anecdota Græca*. In 1700 he became conservator of the public archives and principal librarian of Modena. His three great works are *Rerum Italicarum Scriptores* (25 vols. fol., Milan, 1723-'51), *Antiquitates Italicae Medii Ævi* (6 vols. fol., 1738-'42), and *Annali d'Italia* (12 vols., 1744-'9). To publish this vast collection several princes and nobles of Italy subscribed \$4,000 each. The best uniform edition of his works is that published at Venice (48 vols. 8vo, 1790-1810).

MURAVIEFF, an ancient Russian family, originally settled in the former grand duchy of Moscow, and since the latter part of the 15th century in various other parts of the country. **I. Mikhail**, born in Smolensk in October, 1757, died in St. Petersburg in July, 1807. He was tutor of the grand dukes Alexander and Constantine, for whom he prepared a series of essays on history, ethics, and literature. Paul I. appointed him privy councillor, and Alexander I. deputy minister of popular instruction. An edition of his writings was published in 3 vols. (Moscow, 1810; supplement, St. Petersburg, 1815). **II. Nikolai**, born in Riga in 1768, died in Moscow in 1840. After many years of active service in the Russian army and navy, he established near Moscow a private military academy. He took part in the campaign of 1812-'13, concluded the capitulation of Dresden with Gen. Dumas, and was present at the siege of Hamburg. After the peace he resumed his duties at his academy, which in 1816 was raised to the rank of an imperial institution. He conducted it till 1823, from which time till his death he devoted himself to agriculture. He was one of the founders of the Moscow agricultural society. **III. Nikolai**, second son of the preceding, born about 1794, died in November, 1866. He entered the army in 1811, was employed in the military service in the Caucasus, and published in 1822 an account of his travels in Khiva, whither he had been sent on a political mission by Gen. Yermoloff. In 1828 he took part in the Persian war, and

in 1831 in the Polish campaign. He was made lieutenant general, commanded during the siege of Warsaw in September the right wing of the Russian army, and stormed the fortifications of Rakowiec. He commanded the Russian corps which landed in Asia Minor, and arrested the advance of Ibrahim Pasha toward Constantinople after his victory at Konieh, and then visited Mehemet Ali in Cairo. He superintended the construction of the fortifications of Sebastopol, but fell into disgrace in 1838, for having in a sham fight made prisoners the emperor Nicholas and his staff, and lived in retirement in Moscow till 1848, when he became a member of the board of war, and afterward commander of the corps of grenadiers in the imperial guard. In 1855 he was in command of the army of the Caucasus as general of infantry and governor of Transcaucasia, and conducted the siege of Kars with great energy and ability from the beginning of June till Nov. 27, 1855, when the fortress was compelled to capitulate. Muravieff was rewarded with the title of prince, but, being unpopular with his fellow officers and the court, spent his last years in retirement. **IV. Mikhail**, brother of the preceding, born in 1796, died in 1866. At the age of 15 he was a teacher in the military school established by his father. In 1813 he took part in the campaign against the French, and on his return continued his military studies, and about this time translated Garnier's *Géométrie analytique* into Russian. In 1823 he became colonel in the army; in 1831 military governor of Grodno and subsequently of Kursk; in 1842 chief director of the topographical corps and major general; and in 1850 a member of the council of the empire. He was soon after chosen president of the geographical society, and sent an important scientific expedition to Siberia. In 1857 he became president of the department of apanages, in which office he did much to promote the advancement of agriculture. In 1863 he was appointed governor general of Wilna, and his rigorous rule during the Polish insurrection was not wholly approved by Alexander. In 1866 he was president of the commission to discover the accomplices of Karakozoff in the attempted assassination of the emperor. **V. Nikolai**, born in 1810, served a long time in the Caucasus, and in 1847 was made lieutenant general and governor general of eastern Siberia. He concluded the treaty of May, 1858, by which China ceded to Russia the Amoor territory, for which service he was created Count Amurski. In 1859 he concluded at Yedo a treaty with Japan favorable to Russia, and in 1861 was made a member of the council of the empire. **VI. Alexander**, son of the first mentioned Nikolai, born in 1792, died in 1864. He was implicated in the revolutionary movement of 1825, and was exiled to Siberia. In 1853 he was restored to the army, and during the Crimean war he was made major general. In 1855 he was governor of Nizhni

Novgorod, and he took an active part in the emancipation of the serfs. At the time of his death he was a lieutenant general and a member of the senate.—A branch of the family has adopted the name of MURAVIEFF-APOSTOL, from the marriage of one of them in the 18th century with a daughter of a Cossack hetman named Apostol. Noticeable among this branch is IVAN (born in 1769, died in 1851), who translated Sheridan's "School for Scandal," Horace's "Satires," and Aristophanes's "Clouds" into Russian, and published in 1822 an account of his archaeological explorations in Taurida. He officiated as ambassador at several European courts, and was eventually made a privy councillor and senator. His son SERGEI was a conspicuous leader of the conspiracy of 1825, and after the unsuccessful attempt in St. Petersburg he proclaimed the grand duke Constantine as emperor and took possession of the town of Vasilkov. He was defeated and severely wounded near Ustinovka, Jan. 15, 1826, removed to St. Petersburg, and executed July 25. His brother Ippolit was killed, and another was banished to Siberia.

MURCHISON, Sir Roderick Impey, a British geologist, born at Tarradale, Ross-shire, Scotland, Feb. 19, 1792, died in London, Oct. 22, 1871. He obtained a commission in the army in 1807, served during a portion of the peninsular war, and was employed on the staff of his uncle Sir A. Mackenzie in Sicily. He retired with the rank of captain of dragoons in 1815, married a daughter of Gen. Hugonin, and through her influence and the advice of Humphry Davy devoted himself to natural science. In 1825 he read a paper before the geological society "On the Geological Formation of the Northwest Extremity of Sussex, and the adjoining parts of Hampshire and Surrey." In 1827 he explored the highlands of Scotland, and in 1828 accompanied Lyell in a tour through France, studying the volcanic regions of Auvergne and the formation of valleys. He next undertook, with Prof. Adam Sedgwick, a systematic examination of the lower fossiliferous rocks of England and Wales. He partially remodelled the classification of the palæozoic strata, and in 1832 first applied the term Silurian to a series of rocks intermediate between the Cambrian and Devonian formations. Murchison recognized two main divisions as constituting the Silurian system, an upper and a lower, the latter of which he believed to lie imposed upon the upper Cambrian of Sedgwick. Subsequent researches have shown that the geological sections of Murchison, upon which his system was based, were in great part erroneous, and that his lower Silurian was identical with the upper Cambrian. This discovery gave rise to a long and acrimonious controversy between Sedgwick and Murchison and his partisans; but later researches, by comparing the justice of Sedgwick's views and the correctness of his determinations, are again bringing his nomenclature into use. (See GEOLOGY, and SEDGWICK,

ADAM.) In 1839 appeared "The Silurian System," a revised edition of which was published in 1854 under the name of "Siluria." By invitation of the emperor Nicholas, Murchison, accompanied by De Verneuil and Keyserling, undertook a geological survey of Russia; and between 1840 and 1844 he explored the southern provinces of the empire, and a large portion of the Ural mountains, besides sections of Germany, Poland, Sweden, and Norway. He now conceived the idea of uniting the upper series of the palæozoic rocks, consisting mainly of the lower new red sandstones and the subjacent magnesian limestones, into a single group, for which he proposed the name Permian, from the prevalence of this formation in the ancient district of Perm. The results of the Russian expedition were published in a treatise "On the Geological Structure of the Northern and Central Regions of Russia in Europe" (London, 1841), and in "Geology of Russia in Europe and the Ural Mountains" (1845). In 1856 he published a geological map of Europe, and in 1861, conjointly with Geikie, one of Scotland. He was created grand cross of the Russian order of St. Stanislas in 1845, knighted in 1846, and made a baronet in 1866. In 1846 he was president of the British association. On the death of Sir Henry T. De la Beche in 1855, he became director of the British geological survey, a post which he resigned shortly before his death. Murchison was one of the founders of the royal geographical society in 1830, was elected its president in 1843, was several times reelected, and held the office from 1862 until his death. It was chiefly through his influence that Dr. Livingstone was enabled to prosecute his researches in South Africa. He received the degrees of D. C. L. and LL. D. from the universities of England, and was an associate of nearly all scientific institutions. He opposed the evolution theory of Darwin, stanchly adhering to the doctrine of immutability.—See "Memoirs of Sir Roderick I. Murchison," by Archibald Geikie (2 vols., London, 1874).

MURCIA. I. An ancient kingdom of Spain, bounded N. W. and N. by New Castile, N. E. and E. by the province of Valencia and the Mediterranean, S. E. and S. by the Mediterranean and Granada, and W. by Jaen; area, 10,450 sq. m.; pop. in 1870, 660,040. The coast from the confines of Granada to Cartagena is rocky and precipitous, but eastward from that port it is in general low and sandy. The surface is mostly mountainous. The principal ranges are the Sierra de Sagra, the Sierra de Alcaraz, and the Sierra de Segura. The chief rivers are the Segura, Mundo, and Sangonera. Where it can be irrigated the soil is often of exuberant fertility. The productions are wheat, barley, maize, rye, rice, flax, vegetables, and superior fruit, particularly pomegranates, melons, oranges, and lemons. Lead, silver, sulphur, and nitre are found. The climate is mild, and snow and ice are almost unknown. Murcia was conquered by the Moors in 712, and made

a dependency of the caliphate of Cordova. In 1239 Mohammed Ali or Hudiel made it an independent kingdom, but within a few years it was united to Castile. It was divided in 1833 into the provinces of Murcia and Albacete. The chief port is Cartagena. **II.** The modern Murcia comprises the southern part of the ancient province, bounded S. E. by the Mediterranean and drained by the Segura and its tributaries; area, 4,478 sq. m.; pop. in 1870, 439,067. The S. and N. W. portions are mountainous, and much of the soil is sterile, but near the rivers are some rich tracts whose prolific vegetation has acquired for them the name of *huertas* or gardens. In the southeast are mines of lead and silver. **III.** A city, capital of the ancient and modern province, on the N. bank of the Segura, 220 m. S. E. of Madrid; pop., including suburbs, about 110,000. It is near the centre of the beautiful valley called Huerta

MURDER, a crime defined by Blackstone as the unlawful killing of "any reasonable creature in being, and under the king's peace, with malice aforethought, either express or implied," by a person of sound memory and discretion. The element of "malice aforethought" is of the essence of murder. The greatest difficulty in determining whether a homicide be murder is generally connected with the question of malice. It is quite certain that the malice need not be malice against the individual killed; for if one maliciously shoots at a person with intent to kill him, and missing him kills another, it is quite as much murder as if he had executed his intention. Nor indeed need it be directed against any person in particular. If one shoots into a crowd without knowing a person there, and kills one of them, it is murder; for such a criminal is regarded as having malice against the world, or in the words of the old

cases, he is *hostis humani generis*. Still there must be malice; for probably no kind or degree of mere carelessness or negligence would make a case of homicide one of murder. So if the death were caused by mere mistake, whether of law, of fact, or of the person, it would not be murder, unless it would have been murder if the law or fact or person had been what they were supposed to be. The principal exception to the necessity of proof of actual malice would seem to be where the death was caused without intention, but by the commission of or in attempting a felony. This

Murcia.

de Murcia, and was formerly fortified. It is the residence of the bishop of Cartagena, and has 11 parish churches, a theological seminary, a college, several other learned institutions, an academy of music, a public library, and a botanic garden. The cathedral tower is very imposing, consisting of three quadrangular stages, each diminishing perimetrically and crowned with a dome. It is ascended to the top of the first stage by an inclined plane 320 paces long and of gradually increasing steepness. From the first stage a narrow stairway of 210 steps leads to the summit of the tower. The chief manufactures are earthenware, leather, coarse linen, silk thread, silks and baskets, mats, cordage, and sandals. Murcia was founded by the Moors, and during their supremacy was one of the seven metropolitan cities of Spain. It submitted to the Spaniards in 1243. In 1810 it was plundered by the French under Sebastiani.

distinction is so nice, that while, if one shooting at his neighbor's fowls with intent to destroy them shoots him by accident, this would not be murder, yet shooting them with intent to steal, and with the same result, would, it is said, be murder. Drunkenness has been considered in reference to manslaughter, and a somewhat similar rule is held as to murder; that is, intoxication, if it negatives the supposition of malice, would prevent the crime from being murder, unless it was a state of temporary insanity, purposely brought on that under it murder might be committed safely, in which case it would not be regarded as any excuse whatever.—Cases of compulsion have been somewhat considered; and it has been generally held that strict and actual compulsion was an excuse, but nothing less. If a captive on board a pirate were compelled to act with the crew in committing murder by threats of immediate death, this compulsion would undoubtedly be

a sufficient excuse; but nothing less than a compulsion of this character would have this effect; as no command from a master, and no threat of a whipping, would be any excuse at all for a servant. But a jury, who can now judge of the law as well as the fact in criminal cases, if they were satisfied, from the evidence of command or threat, of the absence of all malice, either general or individual, would seldom render a verdict of murder. So if a crime be committed by a wife in presence of her husband, it is presumed by the law that she did the act under his coercion, and she is not herself guilty. But murder and treason are exceptions to this rule; and here it is said that no proof of actual constraint by the husband operates as an excuse.—It seems quite well settled, as a general rule, that if many are confederate in any unlawful act, and some one of them, in doing the act, commit a murder, all are guilty; as if several conspire to seize a vessel forcibly and run away with her, and one opposing them is killed in the conflict, all are guilty of murder, in law, who are present, aiding and abetting in the unlawful act. No consent or even request of the party killed is any excuse whatever. At common law, counselling of suicide, if it causes the suicide, is murder. So if two persons agree to commit suicide together, and use means which take effect only on one, it is murder in the survivor, provided he was present when the act was committed, as otherwise he is only an accessory before the fact. In such a case, however, the jury would be very likely to treat the case as manslaughter. If one, by working on the fears of another, or by mere unkind usage, put one into "a passion of grief or fear" whereof he or she, being perhaps at the time in feeble health, dies, this, says Hale, though murder or manslaughter in the sight of God, is not so at common law. Most later writers have adopted this view, which is said to be in accordance with the codes of France and of Scotland; while in some countries the law is held to be, as an English judge in a recent case declared it to be in England, that one is guilty if he cause death by force "applied either to the body or the mind." We consider Hale's view as being that of the common law, and of the prevailing law of the United States. It was a rule of the common law, that it was murder to procure the conviction and execution of an innocent person charged with a capital crime by perjury. Now, however, we are satisfied that both in England and in the United States such a crime would be punished only as an aggravated case of perjury.—The question has arisen, whether one can be indicted in a state or country for murder, if the criminal did actually in that state give the fatal blow, or fire the fatal shot, but the injured party went into another state or country and died there. The weight of authority, and we think of reason, is that no such indictment can be maintained. No country can punish a crime committed abroad, or partially

abroad, unless by its own municipal provisions, applied to its own citizens. In accordance with this view, the statute of the United States against "murder on the high seas" has been held inapplicable to a case where a fatal blow was given with malice on the high seas, but the wounded person reached the shore and died on land.—An important question has exercised the courts, both of England and the United States, in respect to the evidence of murder and the burden of proof. Some courts have held that if the government proved the death alleged, and that this death was caused by the prisoner, the burden of proof then shifted, and it lay on the prisoner to prove want of malice, or accident, or self-defence, or any other justification. Other courts hold the contrary, and we are satisfied that in cases of murder, the actual and practical rule whereby the fate of the prisoner is determined should be and is that the burden of proof remains on the government until they have proved their whole case, which includes the killing and the intent, or "the malice aforethought," without which there can be no murder. This evidence may undoubtedly be indirect or circumstantial, and must be so generally, because malice is a condition of mind and purpose. But it would not be enough in modern times to charge A with the murder of B, and rest the charge upon the mere proof that A killed B, unless there were something in the time, place, or circumstances of the killing, or of the conduct of the prisoner in reference to it, which brought home to a jury a belief that he was moved by malice aforethought.—In some of the states, although not generally, the crime of murder has been divided into degrees; and where capital punishment is retained, only murder in the first degree is punishable with death.—It should be added, that whenever a person is indicted and tried for murder, it is competent for the jury to bring in a verdict of manslaughter.

MURDOCH, James Edward, an American actor, born in Philadelphia, Jan. 25, 1811. He first appeared on the stage in the Arch street theatre, subsequently played in various southern cities, and in June, 1838, appeared in the Park theatre, New York, in leading characters, in support of Ellen Tree. He withdrew from the stage in 1842 to devote himself to the teaching of elocution, and also gave a series of lectures on Shakespeare's characters in Boston, Philadelphia, and New York. On Oct. 20, 1845, he appeared as Hamlet in the Park theatre, New York, and subsequently made professional tours in Canada, California, and England, appearing in the Haymarket theatre, London, in 1856. In 1858 he retired to a farm in Lebanon, Ohio. During the civil war he gave elocutionary entertainments throughout the north in aid of the sanitary commission, devoted himself to the care of sick and wounded soldiers, and served for a while on the staff of Gen. Rousseau. Since then he has resided in Philadelphia as a professional elocutionist. In con-

junction with William Russell he published "Orthophony, or Culture of the Voice" (12mo, Boston, 1845).

MURDOCK, James, an American clergyman, born in Westbrook, Conn., Feb. 16, 1776, died in Columbus, Miss., Aug. 10, 1856. He graduated at Yale college in 1797, was ordained as a Congregational minister in 1801, and in February, 1802, was settled in Princeton, Mass. In 1815 he became professor of ancient languages in the university of Vermont, and in 1819 of sacred rhetoric and ecclesiastical history in the theological seminary at Andover, Mass. In 1828 he removed to New Haven, where he devoted himself to the study of ecclesiastical history, the oriental languages, and philosophy. His principal works are: a translation from the German of Münscher's "Elements of Dogmatic History" (New Haven, 1830); a translation of Mosheim's "Institutes of Ecclesiastical History," with copious notes (3 vols., New Haven, 1832; revised ed., New York, 1839); an edition of Milman's "History of Christianity," with a preface and notes (New York, 1841); "Sketches of Modern Philosophy, especially among the Germans" (Hartford, 1842); a "Literal Translation of the whole New Testament from the Ancient Syriac Version," with a preface and marginal notes (New York, 1851); and a translation from the Latin of Mosheim's "Commentaries on the Affairs of the Christians before the time of Constantine the Great" (2 vols., New York, 1852). He also published several sermons, one of which, on the atonement (1823), attracted great attention. He was a member of many learned societies, and in 1819 received the degree of D. D. from Harvard university.

MURE, William, a Scottish author, born at Caldwell, Ayrshire, July 9, 1799, died in London, April 1, 1860. He was educated at Westminster school and the university of Edinburgh, and completed his studies in Germany. He published "Remarks on the Chronology of the Egyptian Dynasties" (1829), "A Dissertation on the Calendar of the Zodiac of Ancient Egypt" (1832), "Journal of a Tour in Greece" (1838), and "Critical History of the Language and Literature of Ancient Greece" (5 vols., 1850-'57), which was left unfinished. He represented Renfrewshire in parliament from 1846 to 1855, and in 1847-'8 was lord rector of the university of Glasgow.

MURET, Théodore César, a French author, born in Geneva, Jan. 24, 1803, died at Soisy, near Paris, in July, 1866. He was descended from French Protestant refugees, studied at Geneva and Rouen, took his degree of advocate at Paris in 1829, and devoted himself to journalism in the legitimist interest, and to dramatic and general literature. The best known of his vaudevilles, in which he had collaborators, are *Le médecin de campagne* (1838) and *Le docteur Saint-Brice* (1840). He published novels and many pamphlets, some of which, especially *La Vérité aux ouvriers, aux paysans, aux soldats*

(1849), had an enormous circulation. His other works comprise *Histoire de Paris* (1837; 2d ed., 1851); *Souvenirs de l'ouest* (1838); *Les grands hommes de la France* (2 vols., 1838); *Histoire de l'armée de Condé* (2 vols., 1844); *Histoire des guerres de l'ouest* (5 vols., 1848); and *L'Histoire par le théâtre* (3 vols., 1864-'5).

MUREX, a genus of gasteropod mollusks, found in almost all temperate and tropical seas at depths varying from 25 to 60 fathoms. About 200 living species are known, and 160 fossil, chiefly belonging to the eocene formation. Some of the species are remarkable for their very long and slender beak, along which the canal is partly closed. The shells are ornamented with three or more longitudinal ridges, from which sometimes proceed rows of long pointed spines, which are removed by the animal when they interfere with its growth. The murices are particularly interesting from their having been the source of the famous Tyrian dye. It is said that heaps of broken shells of the *M. trunculus*, and caldron-shaped holes in the rocks, may still be seen on the Phœnician shore; and on the coast of the Morea there is evidence that the *M. brandaris* was anciently used for the same purpose of collecting the purple secretion of which the dye was composed. The ancients bruised the smaller shells in mortars, but took out the animal from the larger ones. Several species of *purpura* also produce a fluid which gives a dull crimson dye. An imitation of the purple dye prepared from uric acid, treated by nitric acid and combined with ammonia, was discovered by Prout in 1818, and afterward named by Liebig and Wöhler murexide. It is now produced from guano, and is used for the dyeing of foulard silks. The coloring fluid is secreted by a special gland situated on the mantle; in *murex* and *purpura* it is colorless when secreted, but on exposure to the sun becomes first yellowish, and finally violet, passing through the tints formed by the mixture of yellow, blue, and red. The *M. tenuispina* of the Moluccas is

Murex (*Murex tenuispina*).

one of the handsomest species, 5 to 6 in. long. A handsome species is abundant on the Central American coasts.

MURFREESBORO, a city and the capital of Rutherford co., Tennessee, situated near the centre of the state, on an elevated and healthy plain bounded E. by the Cumberland mountains, on the Nashville and Chattanooga railroad, 32 m. S. E. of Nashville; pop. in 1870, 3,502, of

whom 1,805 were colored. It is regularly laid out, lighted with gas, and well built, principally of brick. The court house is large and handsome, and stands in the centre of the public square. Being surrounded by a fertile and thickly settled country, the city has an important trade, especially in cotton and grain. It contains two national banks, a manufactory of cedar ware, an extensive saw mill, a cotton gin manufactory, a pork-packing establishment, several cotton gins and grist mills, carriage factories, &c. There are four public school departments, two for white and two for colored children, a private school, a female institute, the Soule female college under the patronage of the Methodists, two weekly newspapers, and ten churches (four colored). Murfreesboro was the seat of Union university, founded by the Baptist educational society in 1848, but now suspended. In the immediate vicinity of the city are the Tennessee central fair grounds, occupying 20 acres handsomely improved. Near by are a large national cemetery, beautifully laid out and decorated, containing a monument to those who fell in the battle of Murfreesboro, and a confederate cemetery.—The town was established in 1811, and incorporated in 1817. The state legislature met here from 1819 to 1825. Early in the summer of 1862 it was occupied by a small Union force. On July 13 it was captured by the confederates under Forrest, a Michigan regiment being made prisoners. Soon after Gen. Bragg made it the centre of his operations in Tennessee, having about 50,000 men, of whom nearly a third were cavalry. Late in November Gen. Rosecrans moved from Nashville with about 40,000 infantry and 3,000 cavalry, and took up a strong position near Murfreesboro. For nearly a month the two armies lay watching each other. At length Bragg sent the greater part of his cavalry to operate against the lines of communication of Rosecrans, who thereupon took the offensive. Skirmishing began on Dec. 26, but the main engagements took place Dec. 31, 1862, and Jan. 2, 1863. The action of Dec. 31 was severe but indecisive. On Jan. 2 the confederate forces made one more vigorous attack. Bragg was finally repelled, and on the 4th he abandoned Murfreesboro, of which Rosecrans took possession next day. He fortified the place, and made it his depot of supplies, remaining there for six months, after which he advanced toward Chattanooga, whither Bragg had fallen back. The battle of Murfreesboro, commonly called that of Stone River, was, in proportion to the numbers engaged, one of the most bloody of the war. Bragg says he had 35,000 men engaged, and that the Union force was about 70,000. Rosecrans puts his force at 43,000, estimating that of the confederates at 62,000. The Union loss was 1,553 killed, about 7,000 wounded, and 3,000 prisoners. Bragg puts his entire loss at about 10,000.

MURGER, Henry, a French author, born in Paris in 1822, died there, Jan. 28, 1861. He had only limited opportunities of education, and became a lawyer's clerk, and afterward secretary of Count Tolstoi, a Russian resident of Paris. He wrote in prose and verse, and led a precarious life as a journalist and *littérateur* till 1848, when his *Scènes de la vie de Bohême*, describing his own experiences, made him famous. He dramatized it in 1851, with Théodore Barrière, with considerable success. Among his subsequent works are poems, plays, novels, and new series of his sketches of "Bohemian" life in Paris, including *Le pays latin, scènes de la vie d'étudiant* (1852).

MURIATIC ACID. See HYDROCHLORIC ACID.

MURILLO, Bartolomé Estéban, a Spanish painter, born in Seville, where he was baptized Jan. 1, 1618, died there, April 3, 1682. At an early age he entered the studio of his uncle Juan de Castillo, and soon began to sketch the ragged, sunburnt children of the street, and to paint pictures of Spanish low life. The removal of his master in 1640 to Cadiz threw Murillo upon his own resources, and he painted several coarse and hurried pictures to sell in the public fairs of Seville. To procure means to enable him to study in Madrid, he executed pictures for the colonial market, which were distributed throughout the Spanish American possessions, comprising the greater part if not the whole of his paintings in churches and monasteries of the new world, and the number and value of which have been greatly exaggerated. With the money thus acquired he went in 1643 to Madrid, and was kindly received by Velasquez, who admitted him to his academy and introduced him to the royal galleries of the capital and the Escorial, where during the next two years he copied the works of Titian, Rubens, Vandyke, Ribera, and Velasquez. After his return to Seville, his first important commission was from the friars of the convent of San Francisco, for the cloisters of which he painted 11 large pictures in the *frio*, described as dark, with a decided outline, which was the first of the three styles usually distinguished in his works. The cloisters were burned in 1810, and the greater part of the pictures carried off by Marshal Soult. Commissions flowed in upon him, and in 1648 he married an Andalusian lady of wealth and rank. Soon afterward he adopted his *cálido* or second style, warm, and with improved coloring, some of the earliest examples of which are "Our Lady of the Conception," the "San Leandro" and "San Isidro," the "Nativity of the Virgin," and the "St. Anthony of Padua." From the last, in the cathedral of Seville, the figure of the saint was cut out and stolen in 1874, but recovered in New York in January, 1875. In 1660 Murillo, in conjunction with Valdes Leal and the younger Herrera, founded an academy of art in Seville, of which he was president till his death. To this period may be ascribed his four large semicircular pictures, executed for

the church of Santa Maria la Blanca in Seville. Two of these, representing the legend of the dream of the Roman patrician which led to the building of Santa Maria Maggiore in Rome under Pope Liberius, now hang in the academy of San Fernando in Madrid. They are in the *vaporoso* style, described as misty, vaporous, and blending, and are magnificent specimens of the artist's powers. Between 1660 and 1674 was executed, for an almshouse outside the walls of Seville, a celebrated series of pictures. Five of these, "Abraham receiving the three Angels," "The Return of the Prodigal Son," "The Healing of the Cripple," "St. Peter released from Prison by the Angel," and "St. Elizabeth of Hungary," were carried off by Soult. The first two were sold to the duke of Sutherland; the third was bought by Mr. Tomline, an English collector, for 160,000 francs; the fourth is in the Hermitage in St. Petersburg; and the fifth, with the two pictures from Santa Maria la Blanca, is in the academy of Seville. Of the original series still remaining in the almshouse the chief are "Moses striking the Rock," "The Charity of San Juan de Dios," and "The Miracle of the Loaves and Fishes," works conceived with all the artist's strength in the maturity of his powers. Subsequent to 1675 he painted a series of about 20 pictures for the convent of the Capuchins in Seville, of which 17 are now in the museum of the city. One of the best of these, "The Charity of St. Thomas of Villanueva," presents many striking studies of street nature, and was called by the artist *su lienzo*, "his own picture." Another celebrated picture formerly in the chapel of the monastery, representing the Virgin and child, is said to have been painted on a *servilleta*, whence it was called the "Virgin of the Napkin." He subsequently executed fine series of pictures for the *hospital de los venerables* and the Augustinian convent of Seville, and a multitude of miscellaneous works, generally of a religious character. Preëminent among them were those devoted to the illustration of the immaculate conception of the Virgin; and from the frequency and fondness with which he represented the subject, he was called "the painter of the conceptions." A memorable example of this style of picture is the "Immaculate Conception," purchased at the sale of Marshal Soult's collection in 1852 by the French government for 635,000 francs, and now in the Louvre, in which the Virgin appears in a state of ecstatic beatitude, borne aloft in a golden ether to heaven by a multitude of cherubs, who are painted with inimitable sweetness. A few similar works, attributed to him, are owned in the United States. His remaining works are distributed among the royal and private galleries of Europe. The Louvre contains a considerable number; the Pinakothek in Munich has two or three admirable specimens of his beggar boys; Dulwich gallery has six pictures, including the celebrated "Flower Girl;" and the national gallery

of London has his "Holy Family" and "Infant St. John and the Lamb." The Hermitage in St. Petersburg has 18 of his pictures. His "Little Shepherd" (*El pastorcico*), presented by Queen Isabella to Guizot, was sold by him at auction in May, 1874, for 120,000 francs. Such, however, has been the mania of late years for his works, that his name has been applied indiscriminately to productions utterly unworthy of his pencil, and many of the pictures of peasants and beggars attributed to him are supposed to be by his followers or pupils. A short time before his death Murillo went to Cadiz to paint the "Espousals of St. Catharine" over the high altar in the Capuchin church of that city, and while engaged upon the work stumbled and fell from the scaffolding, receiving an injury which proved fatal. He was buried in the church of Santa Cruz in Seville, before a picture of the "Descent from the Cross" by Pedro Campana, which he had greatly admired in his life. The French in 1810 levelled the church to the ground, and "cast out the ashes of Murillo to the winds." Murillo was essentially a painter of religious subjects, and excelled as a colorist. As a landscape painter his scenery is often conventional and merely accessory. He also painted a few portraits.—See Ford's "Handbook of Spain," Stirling's "Annals of the Artists of Spain," Head's "Handbook of the Spanish School," and Cunningham's "Life of Wilkie."

MURNER, Thomas, a German satirist, born in Strasburg, Dec. 24, 1475, died probably in Heidelberg about 1536. He studied at the principal universities of Europe, lost a place in the conventual Latin school of Strasburg by his invective against Wimpfeling, and led afterward an unsteady life, preaching for some time at Frankfort and other places, but generally incurring the displeasure of his congregation by his coarse personalities. He was successively expelled from Freiburg, Treves, and Venice. He resumed his functions in the conventual school of Strasburg in 1519, and became one of the most virulent opponents of the reformation. In 1523 he went to England, invited by Henry VIII., but troubles in his convent compelled him to return. Some of his writings against the reformation had already been burned by order of the Strasburg magistracy; and to elude the vigilance of the authorities he established a press of his own, which was destroyed by a mob, together with his house, and he was compelled to flee to Switzerland, whence he was afterward expelled. In 1506 he had been crowned as poet laureate by the emperor Maximilian, and he had justified the distinction by his *Narrenbeschwoörung* and *Der Schelmen Zunft* (1512). He wrote *Chartiludium logice*, &c. (Cracow, 1507), and other Latin works; prepared a German version of Virgil and other translations; and was also regarded as the editor of *Eulenspiegel*. But he is chiefly remembered by his writings against Luther and the reformation. His most

celebrated satirical work is entitled *Von dem grossen lutherischen Narren* (Strasburg, 1522).

MURPHY, Arthur, a British dramatist, born at Clooniquin, county Roscommon, Ireland, Dec. 27, 1727, died in London, June 18, 1805. He was educated at the Roman Catholic college of St. Omer, spent some years in a banking house in London, and in 1756 was admitted to Lincoln's Inn. He conducted for two years a weekly paper, the "Gray's Inn Journal." In 1758 appeared his first dramatic production, "The Upholsterer," a farce, followed by "The Orphan of China," "The Way to Keep Him," "All in the Wrong," "The Citizen," "The Old Maid," &c. In 1762 he was called to the bar, but at the end of 15 years quitted his profession, and devoted the remainder of his life to literary pursuits. In 1786 appeared an edition of his works in 7 vols. 8vo, containing, in addition to the dramatic pieces above mentioned, his "Three Weeks after Marriage," "Zenobia," "The Grecian Daughter," &c. Some of his plays long kept possession of the stage. In 1792 he published an essay on the life and genius of Dr. Johnson, in 1793 a translation of Tacitus in 4 vols. 4to, and in 1801 a life of Garrick. His translation of Sallust, completed by Thomas Moore, appeared in 1807. At various times in his life he engaged in political controversies, and edited journals opposing Mr. Fox, the first Lord Holland, and Wilkes's "North Briton." In his old age he was made a commissioner of bankrupts, and for the last three years of his life he received a pension of £200. A life of Murphy by Jesse Foot was published in 1811.

MURRAIN (Span. *morriña*, from Lat. *mori*, to die; or Gr. *μαραινειν*, to waste, to destroy), a term applied to various fatal contagious epizootics, and therefore an equivalent to some extent of the Greek *λοιμος*, Latin *pestis*, and English *pest* and *plague*. The diseases most commonly included under this term are Russian cattle plague, apthous fever, lung fever, and malignant anthrax. The first three are true plagues, spreading widely by contagion and irrespective of the influences of season, climate, &c.; the fourth appears to arise from unhealthy local conditions, but in hot, damp, insalubrious years will assume an unusual virulence and spread far beyond its native limits. From the earliest ages these affections have spread widely and disastrously in the track of belligerent armies, being propagated in their herds of supply; and thus on the occasion of any great European war the ravages of pestilence and famine have been superadded to the horrors of fire and sword. The yearly losses of individual countries in such cases were to be counted by hundreds of thousands of stock, while the losses to the continent by a single epizootic are computed at hundreds of millions.—1. *Russian Cattle Plague*, or *Steppe Murrain* (Ger. *Rinderpest*, Fr. *la peste bovine*, &c.), is a contagious fever of cattle and other ruminants, supposed to arise spontaneously in the Kirghiz steppes

and the government of Kherson in southern Russia, characterized by congestion, excessive growth and degeneration of epithelium, sloughing, and ulceration of all the mucous membranes, but especially of those of the alimentary canal. It has spread over western Europe in connection with every great general war, from the irruption of the Huns, about A. D. 375, to the recent Franco-German contest, after which both belligerent countries suffered severely. After the taking of Paris the plague anticipated the famished inhabitants in destroying the cattle set apart for their relief, and out of 10,000 to 12,000 reserved for the troops 800 died in one night. From 1711 to 1769 it destroyed over 200,000,000 head of cattle in Europe; from 1793 to 1796, 3,000,000 to 4,000,000 in Italy; in 1842 it killed 300,000 head of cattle in Egypt, and died out two years later for want of more animals to destroy; and in 1865-'66 it proved fatal to about 500,000 head in Great Britain within 18 months. Excepting in its supposed birthplace on the steppes, this malady is propagated only by contagion, and in ordinary cases passes over exclusively breeding districts into which no strange cattle nor their products are brought. Thus Belgium almost entirely escaped in the recent French outbreak. Austria and Prussia habitually protect themselves by a supervision and quarantine on their frontiers, and only suffer when such barriers are broken down under the exigencies of war.—The poison, which exists in all parts of the body, and is given off in the secretions and exhalations, does not spread far on the atmosphere, but may remain in a frozen or dried condition for many months, without losing its virulence. When this poison has been introduced into the system by inoculation, it remains latent for over 36 hours. At the end of the second day there is a marked elevation of the bodily temperature (2° to 3°), and the following day the mucous membranes of the mouth, nose, and vulva are suffused by a deep livid blush. At this time, or even earlier, there appear on the gums or lips whitish apthous-like elevations, formed of epithelium, which are granular or even approach the characters of pus cells in their deeper layers. On the fourth day there is dulness, appetite and rumination are impaired, and the secretions generally are lessened. On the fifth day illness is recognized by any one, in the great depression, half-closed watery eyes, retracted ears, the dry, hard, and scanty dung coated with mucus, the want of appetite, irregular breathing, and small, weak, and often accelerated pulse. Next day all the symptoms are exaggerated; the bowels are relaxed and dysenteric, the fæces passed with much straining, and the everted gut of a deep red; the back is arched, the abdomen tense and tender, the mouth covered with raw sores from the separation of the white crusts, the muzzle dry, cracked, and raw, the pulse weak and rapid, and the breathing checked with a clucking

sound and a concussion of the whole body at the commencement of expiration. This check to expiration causes emphysema of the lungs, and later of the walls of the chest, where it appears in puffy irregular swellings crackling under pressure. These symptoms are steadily aggravated, emaciation becomes extreme, weakness compels the animal to lie down constantly, the fetid stools pass involuntarily, and the temperature rapidly falls as a precursor of death, which usually happens on the seventh or eighth day. In many mild cases an eruption appears on the skin, consisting of modified epidermic cells. Buffaloes suffer from this affection, and to a less extent sheep, goats, deer, the yak, the aurochs, and even the peccary. The pathological lesions consist largely in stagnation of blood in the capillaries of the various mucous membranes, which, often in the interpulmonary air passages, but above all in the third and fourth stomachs, the small intestines, and the rectum, assume a dark claret color, and are covered besides with black spots of extravasation that may terminate in sloughing and even perforation. The mucous membranes of the urinary and generative organs are often similarly congested and ecchymosed. The blood and diseased textures contain an excess of granules in an active state of vitality, which are believed to be connected with the increase of the poison. Treatment of this disease is inadmissible. The extinction of the poison by the slaughter of the diseased animals, as advised by Lancisi in 1713 and first practised in England in 1714, has been proved by the experience of a century and a half to be the one satisfactory and economical mode of contending with it. Wherever the disease has been treated, as it was generally in former times, and in Egypt, England, and Holland more recently, the losses have been enormous; whereas in countries where the infected were promptly slaughtered, and all that had been in contact with them thoroughly disinfected, it has been invariably extinguished at a trifling cost.—2. *Aphthous Fever* (Gr. *ἀφθα*, from *ἀπτεν*, to set on fire), *Vesicular Murrain*, *Eczema Epizootica*, or *Foot and Mouth Disease*, is a contagious fever of ruminants and omnivora, communicable to other mammals and to fowls by inoculation or the use of the warm milk. It is characterized by the eruption of blisters on the mouth, udder, teats, and feet. It is first distinctly described as prevailing among Silesian cattle in 1686, and has since spread on the occasion of every great European war. England was long protected by its insular position, but imported the disease in 1839, and has steadily maintained it by her continental cattle trade. In 1870 it was carried from England to Canada, and later to Buenos Ayres. From Canada it spread to New York, Connecticut, and Massachusetts; but in the absence of large markets for store cattle, it died out here under moderate restrictions as to movement of stock. Some cases reappeared

in Rensselaer county, N. Y., in the spring of 1871, and in Dutchess county in January, 1872, doubtless from virus preserved in the buildings. It is only known as propagated by contagion, and the absence of spontaneous development in England and America is demonstrated by their immunity for centuries, until the disease was conveyed in imported cattle, by its prompt disappearance from our states when the propagation of the poison was interfered with, and by the continued exemption of some exclusively breeding and secluded districts even in England.—Almost all ruminants and swine are susceptible, but as the poison does not spread through the atmosphere, but mainly or alone on solid bodies, it is easily controlled. After an incubation of about a day, the patient appears chilly, stiff, rough-coated, with warm tender mouth, teats, and feet, and an elevation of bodily heat by 2° F. The second or third day blisters appear on the mouth, teats, and feet; the patient slavers, smacks her lips, stretches the legs out backward and shakes the feet, and flinches on milking. Soon the blisters break, leaving raw sores, which speedily heal up in the mouth, but are often maintained and extended by milking or by filth in the case of the teats and feet. Thus it is that the udder often inflames, suppurates, or sloughs, the womb sympathizes, causing abortion, or the cow becomes an inveterate kicker, or sheds her hoofs and contracts periostitis, caries, or necrosis of the bones of the foot. If however the parts are kept clean, recovery is usually complete in 8 to 16 days. Sheep and swine suffer most seriously in the feet. Other animals have blisters in the mouth, and near the hoofs, nails, or claws. Infants and other sucking animals sometimes contract fatal inflammation of the stomach and bowels. Though rarely fatal, this disease causes great losses by drying up the milk, or rendering it unfit for consumption, by disease of the udder and feet, by abortion, and other complications. It demands little treatment beyond cool soft food and cleanliness, yet advantage may be derived from a laxative when the bowels are costive, and astringent cooling lotions to the affected parts. The feet may require poulticing when much inflamed, or strong caustics when ulcerated. But, like other contagious diseases, this is best prevented by a careful professional supervision over importation, and by the complete seclusion and disinfection of diseased stock, and of all places and objects with which they have been in contact.—3. *Lung Fever*, *Pulmonary Murrain*, *Epizootic or Contagious Pleuro-pneumonia*, *Lung Plague*, &c., is a contagious fever of cattle, characterized by extensive exudations into the respiratory organs, and the phenomena of a low typhous inflammation of the lungs, pleura, and bronchia. This disease has usually spread in company with rinderpest and aphthous fever, but attracted less attention because of its long incubation, its insidious onset, and slow progress, which allowed

the public mind to be preoccupied with its more prompt and fatal congeners. Pulmonary epizootics are mentioned by Tacitus and Columella, and in 1693 Valentin described one which, being confined to cattle, was probably that of our own day. Since then it has usually spread in the track of armies and co-existed with the rinderpest. Though existing continuously in the greater part of western Europe during the whole of the present century, yet it has respected certain countries for a length of time or entirely. Thus England was protected by the narrow strait of Dover till 1889, when the disease was introduced by the same series of importations which carried aphthous fever. Denmark imported it repeatedly from England and Holland, but as often stamped it out by the destruction of the infected animals and a thorough attendant disinfection, and kept clear until the recent war with Germany. In 1860 it was imported from Scotland into Norway, but was at once extinguished by a close quarantine and careful disinfection. In 1858 it reached Oldenburg from Scotland, but was immediately annihilated by the destruction of the infected stock. Switzerland, long slandered as the native home of the plague, has cleared her farms, and now keeps them sound by inexorable slaughter. Mecklenburg has met with an equal success. In 1858 the disease reached Australia by an imported English cow, and was allowed to spread on the open plains until many of them were almost depopulated. In 1843 and 1850 it was brought to Brooklyn, N. Y., and in 1847 to New Jersey, by English cattle, and finally in 1859 into Massachusetts by Dutch cattle. The New Jersey outbreak was extinguished by the destruction of all the cattle on the farm. In Massachusetts a government commission was appointed with power to isolate exposed herds under strict supervision and to kill all diseased animals, remunerating the owners out of state funds; and they finally extinguished the disease after six years' effort and the slaughter of 1,164 cattle, besides those which died of the plague. In New York no sufficient effort was made, and the plague has since been known in the city as the swill-milk disease, and has spread in Kings and Queens counties, into New Jersey, Pennsylvania, Delaware, Maryland, the District of Columbia, and Virginia. Its progress is greatly retarded by the absence of any cattle traffic westward; but should it ever reach the great stock-raising regions of the west, it can scarcely fail to rapidly overrun the entire country.—The disease is undoubtedly propagated by contagion alone in western Europe and America. The poison, which pervades the entire body, is concentrated in the pulmonary exudation, and being exhaled in the breath spreads much further on the atmosphere than those of rinderpest and aphthous fever. It is conveyed long distances in the clothes of human beings, and hence butchers and jobbers are continually

spreading the disease in infected countries. Markets, cars, boats, loading banks, roads, pastures, yards, buildings, clothing, utensils, fodder, &c., are also fruitful means of its diffusion. The bovine race are alone susceptible. After an incubation of four to six weeks, the temperature rises to 103° or 104° F., and an infrequent short dry cough appears, which increases in frequency, depth, and hoarseness. Soon a staring coat, stiff gait, cold horns and legs, tender spine, intercostals, and breast bone, accelerated pulse and breathing, partially suppressed secretions, impaired appetite and rumination, and occasional dryness of the muzzle, mark further progress. The physical signs of effusion into the lungs and pleuræ are present from the first, and the progress of the disease, as well as of recovery, may be followed from day to day by auscultation and percussion. At first the patient may lie on the side most affected, but as the disease advances he stands obstinately with legs apart, nose protruded, and each expiration accompanied by a deep groan. The nose discharges a mucopurulent fluid, with solid masses of mucus and even blood, and a fetid watery diarrhoea sets in and rapidly wears out the animal. Emaciation becomes extreme, and death ensues in four to six weeks, if the patient has escaped the earlier risks of suffocation. The mortality is usually from 50 to 60 per cent. in a newly invaded locality. The lesions are mainly confined to the chest. The lungs are infiltrated with serosity, or later are firmly hepatized, and show the yellow lines or marbling common to all bovine pneumonia; the pleuræ are more or less filled with serum and covered by false membranes, the bronchia congested and covered with a mucopurulent discharge; softening, abscess, gangrene, &c., are not uncommon, and in the worst cases the exudations are often blood-stained. This disease is more amenable to treatment than rinderpest, but, unless where a land is already infected throughout, it is rarely advisable to treat it. Treatment consists in such measures as will moderate the fever, sustain the depressed vital functions, favor the elimination of the poison, and check its reproduction. Laxatives with cooling diuretics and arterial sedatives are often serviceable, especially in the early stages, while in the very prostrate states diffusible stimulants may be freely used. Counter-irritants may be applied to the affected parts of the chest whenever there is evidence of active inflammation, while disinfectants (carbolic acid, bisulphate of soda, and the sulpho-carbates) may be given by the mouth as well as employed to disinfect the building and discharges. The hydropathic treatment by thorough wet-sheet packing has been employed successfully, being repeated as often as the fever rises anew. But prevention is the most economical course, and when few animals in a country are infected this is best secured by their prompt destruction, followed by a thor-

ough disinfection. If a country is generally infected, sound cattle may be protected by the free use of sulphate of iron, or sulpho-carbates, by seclusion, treatment, and thorough disinfection of infected herds; or still better, by inoculation, the animals operated on being shut up in secluded and disinfected stables and treated in every respect like diseased stock. The inoculation is made on the tip of the tail with lymph from a recently infiltrated lung and a mild case of the disease. Store markets should be closed and no stock moved except under a written official warrant, and only from herds in which no disease has existed for over two months (better one year), and where disinfection has been thorough. A special supervision should be kept up at all landing ports, a clean bill of health demanded, and a sufficient quarantine enjoined, since the long incubation of this fever affords every facility for its introduction unobserved.—4. *Malignant Anthrax, Malignant Carbuncle, Carbuncular Fever, Bloody Murrain, Black Murrain, Hematosepsis, Typhæmia, Pelæmia, Blood-striking* (Ger. *Brand*, Fr. *charbon*), &c. These names are applied to a class of specific contagious diseases, enzoötic, but sometimes epizöotic, originating in herbivora, swine, and birds, and communicable to other animals, including man. It is characterized by profound changes in the chemical and vital properties of the blood, disintegration of its globules, impaired or suspended hæmatisis, and exudations and extravasations in the most varied parts, with a tendency to gangrene. In the earlier ages this class of diseases was very prevalent and disastrous, often extending like a plague; and though improved cultivation has greatly limited their ravages, they are still far too frequent and deadly. Fleming quotes from Irish records a notice of an epidemic and epizöotic in 2048 B. C., supposed to have been of this nature. The murrain in Egypt spoken of in connection with the exodus, which attacked all domestic animals (Ex. ix.), and the plague of boils and blains upon man and beast, are referable to different forms of these affections. The decimation of the Grecian army and their beasts at the siege of Troy (*Iliad*, lib. i.), and the combined epidemics and epizöotics in the Roman territories mentioned by Plutarch, Livy, and Virgil, point in the same direction. The records of the middle ages abound in accounts of pestilences on man and beast, many of them unquestionably of this kind. More recently we find the outbreak in Santo Domingo in which, from eating the dead and dying beasts, 15,000 people perished from malignant pustule in six weeks; also the yearly devastations in the Russian provinces, where besides the live stock as many as a fourth of the human population are cut off in the worst anthrax years. In the United States, epidemics occurred near Philadelphia in 1834-'6, in Louisiana in 1837-'9, and in northern New York ("malignant erysipelas"), after a "fatal epizöotic of slavers"

(*glossanthrax*) among horses, in 1825. The records of the bureau of agriculture show its prevalence in the malarious regions of the south, and isolated outbreaks and even human victims are still quite common in the northern states.—Contagion is probably the sole occasion of this affection in man, and a common cause in the lower animals also. In bad cases all parts of the body are poisonous, and the virus may be dried up and kept for an indefinite period without losing its potency; it survives a temperature of 145° F., so that cooked meat is often fatal; and its simple contact with unbroken skin has sufficed to convey the disease. Spherical and staff-like bacteria, always found in the blood and morbid fluids in fatal cases, have been fixed upon as the cause of the malady; but it remains to be proved that they are more than the effect. That insects serve to propagate it is probable, since nearly all cases in man commence on the face, hands, or other exposed part of the body. It prevails above all on marshy soils when drying, in basins with no drainage, on rich river bottoms and deltas, on stiff clays, hard pan, and other impervious subsoils, in rich valleys sheltered from winds by surrounding hills whose rocky sides radiate the heat and hasten evaporation, and even on over-manured soils, saturated with organic matter and rich in nitrates, though the drainage may be moderately good. Yet many marshes prolific of fatal malarious fevers in man are not remarkable for causing malignant anthrax. They seem to be the best fields for the permanent preservation of the poison, but are perhaps not always capable of developing it *de novo*. Plethora, youth, alternations of heat and cold, starvation, overwork, or anything indeed which lowers the vitality or loads the blood with effete organic products, lays the system open to receive the poison.—These diseases are primarily divisible into two great classes: 1, those in which the changes are confined to the blood and internal organs, especially the spleen; and 2, those which, in addition to the blood changes, present local swellings from blood extravasations and sero-albuminous exudations. Of the first class a certain proportion die after a few minutes' illness. This, the apoplectic form, occurs in swine, horses, sheep, and cattle, in about the order named. From apparent health the victim suddenly falls, struggles, perhaps expels blood by some natural opening (nose, anus), and dies. In these there is little change even in the blood. More protracted are splenic apoplexy of horse and ox, blood-striking, braxy or *sang-de-rate* of sheep, and the carbuncular fever of swine and fowls. In these there are profound nervous prostration, pendent head, excited pulse and breathing, sometimes abdominal pain, spots of blood-staining on the visible mucous membranes, or a deep yellow or brownish hue of these parts, and the passage of the elements of blood by some of the natural openings (nose, anus, urinary or-

gans). The temperature, rarely elevated, may be even lowered. Death ensues in from six hours to several days. The blood globules are largely disintegrated, the fibrine replaced by a comparatively incoagulable less oxidized element; if a clot forms, it fails to contract and squeeze out the serum; the blood reddens but little on exposure, its liquid part is stained by dissolved hæmatine, and it contains spherical and elongated bacteria. *Rigor mortis* is rare, decomposition setting in at once with intolerable fœtor. The spleen is enlarged, sometimes ruptured, and other internal organs are often the seats of extravasation or exudation.—The localized forms of the disease are as varied as the seat and extent of the swellings. All such swellings however have characters in common. They appear suddenly, after some general fever and lassitude, and increase rapidly. The skin covering them tends to gangrene, and dries and hardens in part or in whole, becoming cold, and crackling on pressure from the ex-trication of gas beneath. Blisters with red or purple contents may form, or a yellow or purple liquid may ooze from the surface. Extensive sloughing often succeeds. Active inflammation and suppuration are favorable signs. The smaller swellings will sometimes shift from place to place. These external forms of the affection are less fatal than the internal. Among them may be mentioned many cases of so-called *purpura hæmorrhagica* in the horse, in which the head, limbs, and other parts are engorged; the *glossanthrax* or black tongue; the black-quarter of cattle, in which extravasation takes place in one limb or a part of the trunk; the carbuncular erysipelas of sheep and swine; the anthrax of the mouth and carbuncular sore throat of hogs; the boil plague of eastern Europe and Asia; and finally the malignant pustule of man. (See PUSTULE.) The treatment in the local forms of the disease is to destroy the diseased structures with caustic before the general system has been poisoned. For more extended swellings, attended by constitutional disturbance, antiseptics may be applied locally or, better, injected into the enlargements. Carbolic, sulphuric, and chromic acids and iodine may be mentioned, the last having destroyed the virulence of anthrax fluids when dissolved in 12,000 times its weight of water. When sores have formed, the extravasations and exudations may be cauterized throughout, and the sound tissues beneath stimulated to a healthy action. But no sores should be made, save with the fine nozzle of the injecting syringe, where they do not already exist. In both internal and external forms of the affection, the system must be supported by tonics and stimulants; gentle laxatives and diuretics may be used to eliminate waste and pernicious matters from the blood, and antiseptics administered to check the proliferation of the poison as far as possible. Carbolic acid, chromic acid, the mineral acids, and iodine are especially to be recommended. By way of prevention noth-

ing succeeds better than thorough drainage, removal of animals from dangerous enclosed valleys, rich river bottoms, &c., during the hot and dry season, keeping stock indoors until the dews have disappeared in the mornings, good steady dieting, the avoidance of suddenly induced plethora, the maintenance of a healthy action of bowels, kidneys, and skin, and a general attention to sound hygienic principles.

MURRAY. I. A N. W. county of Georgia, bordering on Tennessee, bounded W. by the Conna-sauga river and drained by its branches; area, 320 sq. m.; pop. in 1870, 6,500, of whom 757 were colored. The surface is elevated, and the soil generally fertile. Gold, silver, lead, and zinc are found. The chief productions in 1870 were 47,269 bushels of wheat, 151,286 of Indian corn, 11,123 of oats, 5,810 lbs. of wool, 40,851 of butter, 7,698 of tobacco, 288 bales of cotton, and 10,050 gallons of sorghum molasses. There were 659 horses, 1,067 milch cows, 1,722 other cattle, 3,025 sheep, and 5,454 swine. Capital, Spring Place. II. A S. W. county of Minnesota, drained by the Des Moines and Rock rivers and other streams; area, 720 sq. m.; pop. in 1870, 209. The surface consists of rolling prairies.

MURRAY, or *Goolwa*, a river of Australia, which rises in the Warragong mountains, in lat. $36^{\circ} 20'$ S., lon. $148^{\circ} 15'$ E. Its course is very tortuous, the curvatures being short, abrupt, and almost incessant. After descending from the highlands, it flows nearly westward to lon. $144^{\circ} 45'$ E., then takes a N. W. direction to Mt. Lookout, where again turning it proceeds to Elbow, in lat. 34° S., lon. $139^{\circ} 46'$ E., and there bending suddenly runs S. S. W. to Lake Victoria, into which it falls at Wellington in lat. $35^{\circ} 30'$ S. This river and its tributaries drain an area of about 500,000 sq. m. Its length is about 1,000 m., and its average breadth from 100 to 150 yards. It overflows its banks periodically, and sometimes rises 30 or 40 ft. above its ordinary level. During this season it is navigable to within 90 m. of its source, and then steamers and barges ply regularly between Wellington, Albury, and the intermediate towns. Its principal affluents are the Goulburn, Campaspe, Murrumbidgee (with the Lachlan), and Darling. Lake Alexandrina, Victoria, or Kayinga, which connects it with the sea, is about 30 m. long and 15 m. broad, but in general very shallow. The entrance to it from the sea not being navigable, a tramway has been constructed between Goolwa and Port Elliot, which is worked in connection with the river steamers.

MURRAY, Alexander, an American naval officer, born at Chestertown, Md., in 1755, died in Philadelphia, Oct. 6, 1821. In 1776 he was appointed a lieutenant in the continental navy, but there being no employment for him afloat, he served through the campaigns of 1776-'7 as lieutenant and captain in the first Maryland regiment, participating in the battles of Flatbush and White Plains. At the close of the cam-

paign of 1777 he was appointed to the command of a letter of marque, in which he was captured by a British squadron and carried into New York. After his exchange he served as lieutenant in the Trumbull, in the action with the Iris and Gen. Monk off the mouth of the Delaware. In 1798 he was made captain, and served in the West Indies, in command of the Montezuma, and afterward of the Constellation. In 1802 he commanded the Constellation in the Mediterranean; and an attack which he made upon a flotilla of 17 gunboats was the first affair of the war with Tripoli. At his death he was in command of the navy yard at Philadelphia, and was senior officer of the navy.

MURRAY, Alexander, a Scottish philologist, born at Dunkitterick, Kirkcudbrightshire, Oct. 22, 1775, died in Edinburgh, April 15, 1813. He was the son of a shepherd, learned French, Latin, Greek, Hebrew, Arabic, Welsh, and Anglo-Saxon, and in 1794 entered the university of Edinburgh. In 1806 he was assistant pastor, and in 1808 became pastor of Urr in Kirkcudbrightshire. In 1811 he translated a letter in Geez or old Ethiopic, addressed to the king by the sovereign of Tigré in Abyssinia; and in the following year he was elected to the chair of oriental languages in the university of Edinburgh. His most important works are "Outlines of Oriental Philosophy" (Edinburgh, 1812), and "History of the European Languages, or Researches into the Affinities of the Teutonic, Greek, Celtic, Slavonic, and Indian Nations" (1813). He also edited Bruce's "Travels," and contributed some philological papers to the "Edinburgh Review."

MURRAY, or Moray, James Stuart, earl of, regent of Scotland, born about 1533, killed at Linlithgow, Jan. 23, 1570. He was an illegitimate son of James V. and Lady Margaret, daughter of John, fourth Lord Erskine, and when a little child was appointed by his father prior of St. Andrews. He afterward acquired the priory of Pittenweem, and that of Mácon in France, *in commendam*, with a dispensation to hold three benefices. In 1548, on the invasion of Scotland by Lords Grey de Wilton and Clinton, the one by land, the other by sea, the young prior commanded a small band and repelled a descent made by the latter upon St. Monan on the coast of Fife, driving back the invaders to their ships. In the same year he accompanied his sister Mary to the court of France. In 1558 he was one of the commissioners from Scotland to witness the ceremony of marriage between Mary and the dauphin of France, afterward Francis II. In the contest between the queen regent and the lords of the congregation, he sided alternately with both parties, but finally joined the latter; and when in 1559 the congregation resolved to take the government into their own hands, he was one of the council appointed for civil affairs. After the death of the queen regent in June, 1560, he became one of the lords of the articles, and on the death of Francis II. was commissioned

to go to France and invite Mary to Scotland. On her return he became her confidant, adviser, and prime minister, protected her in the exercise of her religion, obtained from her a proclamation favorable to the reformers, cleared the border of freebooters, and ruled the country with judgment and ability. He was rewarded with the title of earl of Mar, and married soon after Agnes Keith, daughter of the earl marischal, on which occasion Mary gave a series of splendid entertainments. Lord Erskine claiming the earldom of Mar as his peculiar right, Lord James resigned it and received instead the earldom of Murray, and shortly after defeated at Corrichie the earl of Huntly, an unsuccessful competitor for power and popularity. Although governing Scotland judiciously and with undisputed authority, he was too lukewarm a Protestant for the extreme reformers, who lamented the protection he afforded to the queen in the use of the mass, and particularly his defence of her and her ladies in what Knox called "the superfluities of their clothes." Between Knox and Murray a coolness sprung up in consequence, which continued a year and a half; but they were brought together again by their mutual opposition to the queen's marriage with Darnley. Murray had endeavored to prevent it, and finally resorted to arms; but being pursued by his sister at the head of a superior force, he was compelled to fly to England. On the murder of Rizzio, however, he was recalled, and apparently reconciled to the queen. It is not certain whether or not he was accessory to the murder of Darnley. He left Edinburgh the day before, and was also absent from Scotland during the trial of Bothwell and his subsequent marriage with Mary. After the dethronement of the queen and her confinement in Lochleven castle, Murray was appointed regent of Scotland, Aug. 22, 1567. In this situation he acted with vigor and discretion, and kept the country in a state of tranquillity. On the escape of the queen he refused to resign his power, defeated her and her adherents at Langside, March 13, 1568, and followed up the victory by destroying the strongholds of her friends, and more firmly establishing the government. When Mary was tried at York for complicity in the murder of Darnley, Murray bore the most unqualified testimony against her. In passing through the streets of Linlithgow, he was shot through the body by a bullet fired from a window by James Hamilton of Bothwellhaugh, and died the same night. Bothwellhaugh's conduct has generally been ascribed to revenge for a personal injury, but there is reason for believing that he acted as the executioner of a doom pronounced on Murray by his enemies in secret conclave.

MURRAY, John, an American clergyman, born in Alton, Hampshire, England, Dec. 10, 1741, died in Boston, Mass., Sept. 3, 1815. Under the influence of Wesley and Whitefield he became a convert to Methodism, and an occasion-

al preacher in Wesley's connection in Cork, Ireland, whither his parents had removed. About 1760 he returned to England, and a few years later adopted the doctrines of Universalism promulgated by James Kelly, for which he was excommunicated at Whitefield's tabernacle in London. In 1770 he emigrated to the United States. New York and New Jersey were the first scenes of his labors, and subsequently he preached in Newport, R. I., Boston, Portsmouth, N. H., and other places in New England, in some of which his peculiar doctrines subjected him to opposition, and occasionally to open violence. In 1774 he resided in Gloucester, Mass., and upon suspicion that he was an emissary of the British government in disguise, he was ordered to depart; but through the exertions of his friends he was enabled to remain and preach. In the spring of 1775 he was chaplain of the three regiments of the Rhode Island line encamped before Boston, with several of whose officers, including Greene and Varnum, he was on terms of intimacy. The rest of the chaplains united in petitioning Washington to remove Murray from his office, but without effect. His connection with the army was soon after terminated by illness, and he returned to Gloucester, where he was established over a society of Universalists. In 1783 he became plaintiff in a successful action brought to recover property belonging to persons of his denomination, which had been appropriated to the expenses of the original parish of Gloucester, on the ground that the Universalists were not a society legally authorized. He participated in the proceedings of the first Universalist convention at Oxford, Mass., in 1785, and for a number of years he was a delegate to the general convention of the Universalists. In 1788 he made a brief visit to England, and in 1793 was installed over a society in Boston, where he passed the remainder of his life. In 1809 he was paralyzed. He is considered the father of Universalism in America, although his doctrines differed essentially from those now recognized by Universalists. He published three volumes of letters and sketches of sermons, and wrote an autobiography (8th ed., Boston, 1860).

MURRAY, John, a Scottish physician, born in Edinburgh in 1778, died there, June 22, 1820. He began his career as an apothecary in his native city, and subsequently became eminent as a lecturer on natural philosophy, chemistry, materia medica, and pharmacy. In geology he was a zealous Neptunian, and in reply to Playfair's "Illustrations of the Huttonian Theory of the Earth" (1802), published his "Comparative View of the Huttonian and Neptunian Theories." The most important of his other works are "System of Chemistry," "Elements of Chemistry," and "System of Materia Medica and Pharmacy."

MURRAY, John, an English publisher, born in London, Nov. 27, 1778, died June 27, 1843. He was of Scottish descent, and his father,

whose name was MacMurray, established himself in 1768 as a bookseller in Fleet street, London. After a good education acquired at a number of schools, at one of which he lost the sight of an eye by an accident, he was left in his 15th year by his father's death to conduct the business, in which he was assisted by Mr. Highley the shopman, whom he subsequently took into partnership. In 1803 he terminated this connection, and, entering a wider sphere of business, was thenceforth known as one of the most enterprising and liberal publishers of London. By coming forward to the assistance of a number of young men who had become involved in some pecuniary loss in conducting a periodical called the "Miniature," he secured several influential friends, among others Mr. Canning. With the latter he matured in 1807 a project for the establishment of the "Quarterly Review" as a means of counteracting the influence of the whig "Edinburgh Review;" and securing the coöperation of George Ellis, the Hebers, Barrow, Gifford, and others, he commenced in 1809 the publication of the new periodical, which under the editorial supervision of Gifford soon attained a circulation of 12,000 copies. In 1810 Mr. Murray made the acquaintance of Lord Byron, to whom he paid £600 for the first two cantos of "Childe Harold," and whose entire works he subsequently published. Of his generosity and consideration toward the poet many instances are given; and Byron's correspondence with him, published in Moore's "Life of Byron," affords an evidence of the friendly relations existing between them. In 1812 he removed to Albemarle street, where the business is still carried on by his son and successor, John Murray, and where a long line of literary celebrities, including Scott, Byron, Campbell, W. Spencer, Bishop Heber, the elder Disraeli, Hallam, Mme. de Staël, Crabbe, Southey, Washington Irving, and Lockhart, were wont to assemble. Of the numerous important works issued from the press of this house, it may suffice to mention the voyages and travels of Mungo Park, Belzoni, Parry, Franklin, Denham, Clapperton, and Layard; the series of the "Family Library;" the histories of Hallam, Lord Mahon, Grote, Ranke, Sir Gardner Wilkinson, and Mrs. Markham; the "Sketch Book," "Tales of a Traveller," "Life of Columbus," and other works of Washington Irving; the "Domestic Cookery," of which 300,000 copies were published; the despatches of the duke of Wellington; the dictionaries of William Smith; an elaborate series of handbooks of travel; and the works of Crabbe, Heber, Lockhart, Milman, Head, Gleig, Kugler, Lord Campbell, Leake, Borrow, Davy, Rawlinson, Mrs. Somerville, Lyell, Murchison, &c. In 1826 he was persuaded into establishing a daily journal called the "Representative," which proved a failure; but in general his good judgment and tact as a business man rendered his enterprises successful, and the publications

emanating from his house were for the most part books of merit, his imprint being one of their best recommendations. His liberality to authors was a distinguishing trait in his character, and he sometimes made heavy pecuniary sacrifices to gratify others, as in the case of the autobiography of Lord Byron, which he surrendered to Moore on the representation that the publication of it might injure the reputation of the living as well as the dead.

MURRAY, Lindley, an English grammarian, born at Swatara, Lancaster co., Pa., in 1745, died near York, England, Feb. 16, 1826. He received his primary education in Philadelphia, in the academy of the society of Friends; in 1753 he was placed for a time in school in New York, and then entered a counting house, being destined for the mercantile profession. He afterward studied law, was admitted to the bar, and his practice soon became extensive. When the revolutionary war broke out, he retired to the country on account of his health, and there remained four years. But the want of pecuniary means compelling him to return, he engaged in mercantile pursuits, and by the close of the war his fortune had become so ample that he was enabled to retire from business. Impaired health soon induced him to go to England with his family, where he purchased an estate at Holdgate, near York, and occupied himself chiefly with literary pursuits. In 1787 his first work, "The Power of Religion on the Mind," was published anonymously. His "Grammar of the English Language," first issued in 1795, and enlarged and improved in successive editions, for many years superseded all others. In 1797 he published "English Exercises," and a "Key" designed to accompany the grammar; and subsequently an "English Reader," an "Introduction to the English Reader," and an "English Spelling Book." He also published French reading books of a character similar to his English ones. His last publication was a selection from Horne's "Commentary on the Psalms," and "The Duty and Benefits of Reading the Scriptures" (1817). His autobiography, finished in 1809, was published posthumously in 1826.

MURRAY, Nicholas, an American clergyman, born in Ireland, Dec. 25, 1803, died in Elizabethtown, N. J., Feb. 4, 1861. In 1818 he came to America, and became an apprentice in the printing establishment of Harper and brothers. He was brought up a Roman Catholic, but became a Protestant, graduated at Williams college in 1826, studied theology at Princeton, and in 1829 became pastor of a Presbyterian church in Wilkesbarre, Pa. From 1834 till his death he was pastor of the first Presbyterian church at Elizabethtown, N. J. In 1849 he was elected moderator of the Presbyterian general assembly. He published "Notes, Historical and Biographical, concerning Elizabethtown, N. J." (Elizabethtown, 1844); "Letters to the Right Rev. John Hughes, Roman Catholic Bishop of New York," under the signature

of "Kirwan" (New York, 1848; enlarged ed., 1855); "Romanism at Home" (1852); "Men and Things as I saw them in Europe" (1853); "Parish and other Pencilings" (1854); "The Happy Home" (1859); and "Preachers and Preaching" (1860). "A Dying Legacy," a posthumous volume, was printed in 1861.

MURRAY, Patrick, fifth Baron Elibank, a Scottish author, born in February, 1703, died Aug. 3, 1778. In 1723 he was admitted to the Scottish bar, but entered the army the same year, and in 1740 was lieutenant colonel in the expedition to Cartagena, South America. Afterward he turned his attention to literature, and published "Thoughts on Money, Circulation, and Paper Currency" (Edinburgh, 1758); "An Inquiry into the Origin and Consequence of the Public Debts;" "Queries relating to the Proposed Plan for altering Entails in Scotland" (1765); "Letter to Lord Hailes on his Remarks on the History of Scotland" (1773); and "Considerations on the Present State of the Peerage of Scotland" (1774). In politics he was an adherent of the house of Stuart, with whom he maintained a secret correspondence.

MURRAY, or Moray, Sir Robert, one of the founders of the royal society of London, born in Scotland about the beginning of the 17th century, died in June, 1673. In his youth he entered the French service, and rose to the rank of colonel. Subsequently returning to Scotland, he became an ardent supporter of Charles I., and afterward of Charles II., the latter of whom in 1651, during his brief reign in Scotland, appointed him justice clerk and lord of session. During the protectorate his offices were taken from him, but he received them again at the restoration. He was a prominent member of a small club established in London by Boyle, Lord Brounker, and others, for the discussion of questions in natural science, or, as it was then termed, "the new philosophy," and which by Sir Robert Murray's efforts obtained in 1662 a royal charter as a regular scientific body.

MURRAY, William. See MANSFIELD.

MURRAY, William Henry Harrison, an American clergyman, born in Guilford, Conn., April 26, 1840. He graduated at Yale college in 1862, and was licensed to preach in 1863. In 1864 he became pastor of the Congregational church in Greenwich, Conn., but removed in 1866 to West Meriden, Conn. In 1868 he was settled as pastor of the Park street church in Boston. He has become distinguished both as a pulpit orator and as a lecturer, and during the winters of 1869-'70 and 1872-'3 he delivered courses of Sunday evening sermons in the music hall, Boston, which have been published under the title "Music Hall Sermons" (2 vols., Boston, 1870-'73). He has also published "Camp Life in the Adirondack Mountains" (1868); "Words Fitly Spoken" (1873), being selections from his pulpit utterances; and "The Perfect Horse" (1873), a contribution to agricultural literature. A weekly publication of his ser-

mons delivered in his church, under the title "Park Street Pulpit," was issued in Boston from the beginning of 1871 till October, 1874, when Mr. Murray resigned his pastorate.

MURVIEDRO (anc. *Saguntum*), a town of Spain, in the province and 16 m. N. by E. of the city of Valencia; pop. about 7,500. It is on the right bank of the Palancia, and was once a seaport, but the recession of the sea has left it 4 m. inland. It is a straggling town at the foot of a hill, which is crowned by a citadel, and the streets are narrow and crooked. The principal industrial establishments are flour and oil mills and four distilleries. The Goths, the Moors, and the Spaniards have freely used the rich marbles of Saguntum as materials for later structures. In 1867 a wall was built around the ruins of the theatre. The fortress was the key of Valencia, and the French under Suchet captured it in 1811, after a battle on the plain, Oct. 25, where with about 20,000 men they defeated the Spanish Gen. Blake, who attacked them with 25,000. (See *SAGUNTUM*.)

MUSEUS. I. A Greek poet, who flourished at Athens in prehistoric times. He was said by some to have been a native of Thrace and a son of Orpheus; while others represented him as the son of Eumolpus and Selene, or of Antiphemus and Helena, and the disciple of Orpheus. He was regarded as the author of various compositions, especially of such as were connected with the rites of Ceres at Eleusis, over which he was thought to have at one period presided. According to a tradition preserved by Pausanias, the Museum at Piræus received its name from Musæus having been interred there. A few specimens of his reputed works are extant; but Pausanias deemed none of the productions ascribed to him genuine except a hymn to Ceres. **II.** A Greek grammarian, supposed by most modern critics to have lived at about the beginning of the 6th century A. D. He was the author of the poem on "The Loves of Hero and Leander," discovered in the 13th century. The best editions of it are those of Passow (Leipsic, 1810) and Schäfer (1825). It was jointly translated into English by Marlowe and Chapman (1606), and there are several other English versions.

MUSÄUS, Johann Karl August, a German author, born in Jena in 1735, died in Weimar, Oct. 28, 1787. He studied theology, and was a candidate for a rural parish, but his services were declined on account of his having participated in a dance; upon which he renounced divinity, and accepted in 1763 an employment at the court of Weimar, as governor of the pages. He exchanged this office in 1770 for that of professor at the gymnasium of Weimar, which he held until his death. He wrote *Grandison der Zweite*, republished in 1781-'2 under the title of *Der Deutsche Grandison*, directed against Richardson's admirers. He also took the field against Lavater in his *Physiognomische Reisen*. His *Völksmärchen der Deutschen* (5 vols., 1782) gained a still wider popularity.

Kotzebue prepared an edition of his remains (Leipsic, 1791), with a biography of the author, whom he calls the good Musäus. Carlyle's "Specimens of German Romance" (London, 1827) contains versions of some of the tales.

MUSCARDINE, a name given by the French to a disease which for the last 20 years has proved very destructive to silkworms, and has seriously interfered with the production of silk in France and other parts of Europe. The fact is now well established that the disease is due to a minute fungus, *botrytis bassiana*, which is not confined to the silkworm, but attacks several other caterpillars. The mycelium (see *FUNGUS*) of this fungus lives in and feeds upon the intestines and other interior portions of the silkworm, finally destroying it. After its death the reproductive portion of the fungus may be seen upon the surface of the worm, giving it the appearance of having been dusted with flour; under a microscope this appears to be a forest of minute branching threads which produce an abundance of spores. Sometimes the silkworm retains sufficient vitality to spin its cocoon, and the fungus does not manifest itself externally until the caterpillar has assumed the state of pupa. It is found that the disease is communicated even if the spores fall upon the skin of the worm; indeed, the spores are so exceedingly small that they readily escape observation, and when the fungus is once introduced into an establishment they may be on the leaves upon which the worm feeds, and be thus taken into its interior, or they may be brought in contact with the worms in various ways. Absolute cleanliness and washing every portion of the room with lime water are the means of preventing its spread. Neither muscardine nor any other of the diseases of silkworms has appeared in California.

MUSCAT, or **Mascat**, the chief city of Oman, in Arabia, situated at the head of a small inlet of the Indian ocean, in lat. 23° 38' N., lon. 58° 40' E., about 240 m. S. E. of the entrance to the Persian gulf; pop. within the walls, about 30,000; of the suburbs, 5,000. The cove of Muscat, as the harbor is called, is about three fourths of a mile long and half as broad, opening toward the northwest. To the west of this inlet is the larger bay of Muttra, or Matara, capable of affording shelter to shipping when bad weather renders it difficult to enter the cove. The city stands on the S. side of the cove, in a hollow at the foot of cliffs 400 or 500 ft. high, and there is only one pass communicating with the interior. As seen from the sea, these cliffs have no trace of vegetation. Their summits and flanks are occupied by a chain of forts and towers, reached by difficult and narrow paths. These fortifications, which were built by the Portuguese at the end of the 16th century, are in a ruinous condition, and most of their guns have lost their carriages. The city walls are flanked by four fortified gates. The streets are narrow and dirty, and some of them are almost impass-

sable. Half the town is in ruins. Many of the houses are mere mat huts, and even those of the better class are seldom more than one story high. The sultan's residence is a very plain edifice. There is no police, and no constraint on the citizens, who have the largest liberty, and eat, sleep, and sometimes die in the open streets. The climate is excessively hot, and the land breeze at night is suffocating. The thermometer rarely falls below 90° in the shade. The inhabitants are composed of Arabs, Persians, Syrians, Kurds, Hindoos, Afghans, Belooches, and negroes. The prevailing language is a corrupt Hindostanee, the Arabic tongue being confined to the native Arabs. Most of the merchants live at Muttra and other towns along the coast, and bring in boats each morning the produce of the interior and of the places along the Persian gulf, even fire wood being thus imported. Muscat has an extensive transit trade with Arabia,

Persia, and India. Corn and cloth are the principal imports; the exports are dates, horses, salt fish, hides, and madder, which are sent to India; sharks' fins, to China; and asses, to Mauritius. The harbor abounds with fish, and large quantities are cured.—The district of Muscat comprises the city and its suburbs, and the city and suburbs of Muttra, which, about 4 m. W. of Muscat, is connected with it by a good road. Muttra stands in an open plain exposed to the sea breeze, and is much cooler than Muscat. It has docks for building and repairing ships, and a large part of its population of about 25,000 are fishermen, boatmen, sailors, and pilots. The sterility of the country around Muscat is only apparent. In the valleys back of the hills are woods, streams, gardens, and villages.—In the 15th century Muscat was a place of considerable importance, and was subject to Ormuz. Albuquerque took it in 1507, and it soon after became the centre

Muscat.

of the Portuguese commerce in that part of the world. In 1648 the natives expelled the Portuguese, and took possession of several places in the Persian gulf. In 1707 they obtained permission from the king of Pegu to build vessels in his territory, constructed ships armed with from 30 to 50 guns, and committed great depredations on the coasts of Malabar and the Persian gulf, and on vessels in the Indian ocean. During the latter part of the 18th century they gave up their piratical habits and engaged largely in commerce. (See OMAN.)

MUSCAT or Muscatel Wine. See FRANCE, WINES OF, vol. vii., p. 411, and GERMANY, WINES OF, vol. vii., p. 775.

MUSCATINE, a S. E. county of Iowa, bordering on Illinois, from which it is separated by the Mississippi, and intersected by Red Cedar river; area, 440 sq. m.; pop. in 1870, 21,688. It has a diversified surface and fertile soil, and contains extensive beds of coal and quarries of freestone and limestone. It is traversed by

the Chicago, Rock Island, and Pacific railroad. The chief productions in 1870 were 333,147 bushels of wheat, 36,726 of rye, 1,208,640 of Indian corn, 320,256 of oats, 96,049 of barley, 147,005 of potatoes, 28,090 lbs. of wool, 380,382 of butter, and 29,841 tons of hay. There were 9,238 horses, 7,101 milch cows, 12,656 other cattle, 7,173 sheep, and 24,504 swine; 5 manufactories of boots and shoes, 13 of carriages and wagons, 9 of clothing, 4 of machinery, 11 of saddlery and harness, 10 of tin, copper, and sheet-iron ware, 6 breweries, 4 flour mills, 2 planing mills, and 3 saw mills. Capital, Muscatine.

MUSCATINE, a city and the capital of Muscatine co., Iowa, on the W. bank of the Mississippi, at the apex of the great bend, and on the Muscatine division of the Burlington, Cedar Rapids, and Minnesota railroad, and the southwestern branch of the Chicago, Rock Island, and Pacific line, 130 m. E. of Des Moines; pop. in 1850, 2,540; in 1860, 5,324; in 1870,

6,718; in 1873, 7,940. It is built on a rocky bluff, and is the shipping point of an extensive and fertile country. Its lumber business is large, employing 500 hands. Four large saw mills in 1872 produced 30,100,000 ft. of lumber, 20,950,000 shingles, and 8,700,000 laths. The entire quantity handled at this point during the same year embraced 63,668,000 ft. of lumber, 27,891,000 shingles, and 15,049,000 laths. There are two large pork-packing establishments, three extensive flour mills, gas works, and three banking houses. The city

has good public schools, a Catholic school, two daily, a semi-weekly, and three weekly newspapers, a monthly periodical, and 14 churches. Muscatine was first settled in 1836, and was incorporated as a city in 1853.

MUSCLE (Lat. *musculus*), the fibrous contractile tissue forming the flesh of man and animals, by which locomotion and the various functions of life requiring voluntary or involuntary movements are performed. Whether elongated or enclosing a cavity, this tissue is arranged in the form of fibres, usually in bun-

FIG. 1.—Muscles and Tendons of the Arm and Hand.

dles connected by areolar tissue, surrounded by a vascular network, and supplied with nervous filaments. Muscles are so arranged as to produce great velocity, extent of motion, and strength, without injuring the beauty of proportions, by the obliquity of their fibres to the tendons and of the last to the bones on which they act, and by the proximity of their points of insertion to the axis of motion of the joints. Muscles are attached to bone by means of tendons, rounded or flattened fibrous cords, white and shining, inelastic, and very resisting; aponeuroses or fasciæ are firm, shining fibrous membranes, enveloping the muscles, giving attachments to their fibres, and often fixed to bones like the tendons. Muscles occupy the whole distance between the skin and bones, and take an elongated, broad, or thin form, according to the necessities of the several parts of the body; their strength is in proportion to their length and thickness, and may be rapidly exhausted by continuous exertion. Muscles are called voluntary or involuntary, according as they are or are not under the control of the will; the division is not strictly accurate, as all of the former at times contract independently of the will, and some of the latter are to a certain extent under the influence of volition. The former are generally solid, as in the muscles of the trunk and limbs, and the latter hollow, as in the heart or the muscular layers surrounding cavities and canals. The voluntary and involuntary muscles are also distinguished by their structure; the former consisting of striped, the latter of unstriped fibres. The fibres of voluntary muscles are generally cylindrical, though more or less prismatic or many-sided, being somewhat flattened against each other. They vary in length in different muscles, and in the human subject average $\frac{1}{4}$ to $\frac{1}{2}$ of an inch in diameter. Their color in man and the higher animals is ruddy, and they are elegantly marked by transverse or circular striations, giving them a very characteris-

tic appearance, which has led to their being distinguished by the name of striped fibres. They consist of a cylindrical or prismatic mass of contractile substance marked with the above

FIG. 2.—Striped Muscular Fibre, crushed at one end and breaking up into fibrillæ.

mentioned striations throughout its entire thickness, and containing also minute elongated or oval bodies termed nuclei. Each fibre is invested by a delicate, transparent, structureless and colorless membrane, the *sarcolemma*, which supports the contractile material and limits its lateral expansion. The fibres are

FIG. 3.—Striped Muscular Fibre, highly magnified, torn across, and showing the Sarcolemma.

arranged side by side, parallel with each other, and united in small groups or bundles of 100 to 200 each. These bundles are again united into larger secondary bundles, connected with each other by areolar tissue, and so on; the entire muscle being invested with an external fibrous expansion of condensed areolar tissue, and abundantly supplied with blood vessels and nerves. The unstriped or involuntary muscular fibres are soft, pale, flattened

bands, apparently homogeneous or finely granular, about $\frac{1}{8000}$ of an inch in diameter, with an elongated nucleus in the central part of each one. The fibres are arranged in paral-

FIG. 4.—Transverse Section of a Voluntary Muscle, showing the bundles of Muscular Fibres and intervening layers of Areolar Tissue, and the external Fibrous Expansion.

lel layers, their pointed extremities interlocking with each other, so as to form membranous expansions surrounding the cavities of the internal organs. Thus the œsophagus, the

FIG. 5.—Unstriped Muscular Fibres, highly magnified, from the walls of the Renal Vein.

stomach, the intestines, the bladder and urinary passages, the uterus and Fallopian tubes, the excretory ducts of the glandular organs, and the arteries and veins, all have their muscular coat, composed of unstriped fibres, and liable to contraction and relaxation independently of the will. An exception to the rule that involuntary muscular organs are composed of unstriped fibres is found in the heart and in the great veins immediately contiguous to it. Here the muscular fibres belong to the striped variety, but they are smaller than those of voluntary muscles, their striations are less distinct, and they also present the peculiarity of branching and inosculating with each other, which is not seen in other striated muscular fibres. In all probability the difference in structure between the two kinds of fibres, strictly speaking, has reference to their mode of contraction, rather than to its voluntary or involuntary character. The contraction of the striped muscular fibres is prompt, vigorous, and rapidly followed by relaxation, as in the voluntary muscles and the heart; that of the unstriped fibres is generally sluggish, gradual, and continued, as in the peristaltic action

of the alimentary canal. Striped fibres have been found in all vertebrates and in articulates; as we descend the animal scale the movements become more and more automatic, until complex muscular action gives place to simple ciliary vibration.—The contractility of muscle depends on an inherent property, independent of, though capable of modification by, nervous influence. The stimuli which induce contraction are volition, emotion, impressions conveyed to the nervous centres and involuntarily reflected thence, and various physical and chemical agents applied to any portion of the course of a motor nerve or to the muscular fibres. A muscle in action becomes shorter and thicker, changing its relative proportions without any actual change in bulk. After death muscles become fixed and rigid, a condition constituting the *rigor mortis*. In the active contractions which characterize muscles on the application of stimulus, force is exerted against some opposing power; this is attended with exhaustion or fatigue, and requires intervals of rest. Sustained contraction consists of an infinite number of partial momentary contractions acting in succession. There are altogether in the human body 527 distinct muscles, of which 261 are in pairs, and 5 single on the median line; of these there are in the head and face 83, the *orbicularis oris* being single; in the neck 49, the arytenoid of the larynx being single; in the thorax 78, the *triangularis sterni* and the diaphragm being single; in the abdomen 33, the *sphincter ani* being single; in the back 78; in the upper extremities 98, and in the lower 108. Yet, with all this complex apparatus, everything is in perfect order and harmony. Matteucci and Du Bois-Reymond have investigated the electric currents of muscles. The combination of the muscular movements is in most cases so far independent of the will, that we are apt to lose sight of their perfection; but let paralysis affect one side of the body or contraction draw up a muscle, and the fact becomes at once evident, as may be seen every day in palsy of one side of the face, or strabismus with the turning in or out of the eye. The simple process of walking, performed it may be unconsciously, with its nice adjustments executed by the automatic guidance of the senses rather than by any act of the will, is what the most ingenious mechanician can never effect in an automaton, from the impossibility of harmonizing the many acts which constitute walking.—The energy and rapidity of muscular contraction is more remarkable in the lower animals than in man. The muscular power of insects is seen in the rapid flight of the dragon fly, the leap of the flea and the cricket, the fixed attitudes of some larvæ, and the strength of beetles. It is very great in the flight of birds, though their whole structure is organized for aerial motion; the power of the wings is three times as great as that of the legs in ordinary birds, and their absolute power in proportion to the weight of the body is as 10,000 to 1; in small birds the

movements of the wings are so rapid that they cannot be counted by the eye; the muscular force of the hawk can propel it 150 miles an hour, and the albatross can fly across the ocean without fatigue. Dragons, flying fish, phalangers, and squirrels (*pteryomys*), though well organized in some respects for aerial progression, cannot fly for want of sufficient muscular power; but the extinct pterodactyl shows evidence of having possessed, like the existing bats, extensive powers of flight. The amount of muscular force necessary for flight is so great, that if man could concentrate all the strength employed in a day's labor, he could not support himself in the air for more than five minutes; the accomplishment of flight in man, even with the assistance of any contrivance thus far suggested, may be safely considered an impossibility. The energy of the muscular system of fishes, considering the rapidity with which they move in their dense medium, must be very great. Other familiar examples of muscular power are seen in the constrictions of the boas; the leap of the frog, kangaroo, jerboa, and hare; the speed of the antelope; the spring of the lion; and the strength of the ox and elephant. The muscular power of man is more advantageously displayed by the extent and variety of motion than by actual force; but by scientific training great strength may be obtained from naturally feeble persons. The rapidity of muscular action is familiarly seen in the ventricular contractions of a child's heart, each of which occupies a little more than half a second; in the movements of the vocal cords in rapid singing or speech; and most remarkably in the flight of insects, whose wings strike the air sometimes thousands of times in a minute, by a muscular mechanism and arrangement of elements mentioned under GNAT. Muscle may be hypertrophied from excess of nutrition arising from abundance of formative material, from increased supply of blood, but principally from preternatural formative capacity; the opposite conditions lead to atrophy of muscle. A remarkable change in muscle consists in its fatty degeneration, to which the fibres of the heart are very subject; the muscles of the limbs after paralysis are occasionally thus affected. Throughout the animal kingdom the development of the muscular system is in conformity with that of the nervous system. The vertebral system of muscles is most developed in fishes, the costal in serpents, the hyoid in fishes, the masticatory in vertebrates, the tegumentary in those mammals armed with spines (like the hedgehog and porcupine), and in the unpaired or vertical fins of fishes; those of the voice are most developed in birds, mammals, and man; those of the limbs inversely as those of the spine, and feeblest in fishes; the diaphragm exists in mammals only. The muscles of the hand reach their highest perfection in man, while those of the tongue, eyes, ears, and nose show that many groups of muscles which are

complete in the lower mammals, exist in man in a comparatively rudimentary condition.—Muscles which move a limb in opposite directions are called antagonist muscles. The flexor muscles of the arm, for instance, bend the limb at the elbow joint, and the extensor muscles draw it back, or extend the arm in a direct line; thus these muscles antagonize each other. There is a sort of passive action in the different muscles of the body, constituting what is termed the natural tone of the system; and when this is lost or partially enfeebled in one set of muscles, their natural antagonists have an undue action on the parts, and cause disfigurement by destruction of the natural balance. The form and position of the muscles of the face, for instance, keep up a balance of feature in the natural expression of immobility or stillness; those of one side antagonize those of the other. In paralysis of one side of the face, the muscles of that side are deprived of their natural tone and power of action, while those of the other side retain their tone and power as before; the consequence of which is, that the latter draw the mouth to their side of the face, while the others are unable to counterbalance this action from want of power to act in the opposite direction. Certain muscles are antagonized by the natural elasticity of the parts to which they are attached; the elasticity of the ribs and that of the elastic ligaments of the spinal column may be considered as antagonistic to the natural tone and power of the muscles attached to them, or acting in a contrary direction.

MUSCLE SHOALS. See TENNESSEE RIVER.

MUSCOGEE, a W. county of Georgia, separated from Alabama by the Chattahoochee river, and bounded E. and S. E. by Upatoi creek; area, about 200 sq. m.; pop. in 1870, 16,663, of whom 9,220 were colored. A branch of the Southwestern railroad has its terminus at the county seat. The chief productions in 1870 were 2,140 bushels of wheat, 103,117 of Indian corn, 10,205 of oats, 29,560 of sweet potatoes, 53,147 lbs. of butter, and 5,150 bales of cotton. There were 456 horses, 841 mules and asses, 1,257 milch cows, 2,184 other cattle, and 3,784 swine; 1 manufactory of agricultural implements, 3 of brick, 3 of cotton and 3 of woollen goods, 2 of cotton and woollen machinery, 1 of engines and boilers, 4 founderies, and 5 flour mills. Capital, Columbus.

MUSES (Gr. *μοῦσαι*), in classical mythology, the goddesses originally of song, and afterward of all kinds of poetry and of the arts and sciences. According to the earliest legends, they had their principal seats in Pieria on Mt. Olympus and in Boeotia on Mt. Helicon. Homer styles them the Olympian, and Hesiod the Heliconian; according to the latter, however, they were born on Olympus, and dwelt at a short distance from the pinnacle on which

Jupiter was enthroned, whence they visited Helicon to bathe in Hippocrene, and celebrate their choral dances around the altar on the top of the mountain. K. O. Müller infers, from the fact that the worship of the muses originally flourished on the same mountain which was represented as the common abode of the gods, that it was the poets of that region, the ancient Pierian minstrels, whose imagination created and arranged the Olympian council. Elsewhere they were chiefly honored as the nymphs of fountains. They were commonly esteemed the daughters of Jupiter and Mnemosyne, but were also called daughters of Cœlus and Terra (Uranus and Ge), of Pierus and a Pimpleian nymph, of Jupiter and either Plusia, Moneta, or Minerva, of Apollo and Plusia, and of Æther and Terra. Their number was variously given at first as either three, four, or seven, but was at length established and recognized as nine throughout Greece. Hesiod first states the names of all the nine, by which they are usually designated: Clio, the muse of history; Euterpe, of lyric poetry; Thalia, of comedy; Melpomene, of tragedy; Terpsichore, of choral dance and song; Erato, of erotic poetry; Polyhymnia, of the sublime hymn; Urania, of astronomy; and Calliope, of epic poetry. In Homer as in later authors they sing festive songs at the banquets of the gods, and are invoked by mortal poets to bring before the mind the events which they have to relate, and to confer the gift of poetry. They punished Thamyris, who had presumed to excel them, with blindness; stripped the sirens, who had ventured on a contest with them, of their wings; and metamorphosed the nine daughters of Pierus, who sought to rival them, into birds. Though usually regarded as virgin divinities, the greatest mythical bards, such as Linus and Orpheus, were called their sons. Apollo, as the god of the lyre, led their choir, and they themselves had the gift of prophecy. They were worshipped with libations of water or milk and honey, received various designations from the poets according to the places that were sacred to them, and were represented each with particular attributes in works of art.

MUSEUM (Gr. *μουσείον*, a temple of the muses), a repository of objects relating to history, science, or the arts. In the modern sense of the term the temples of Apollo at Delphi and Juno at Samos, and the acropolis at Athens, as receptacles of works of art, were museums. In history the name was first applied to the academy founded by Ptolemy Philadelphus at Alexandria. Cosmo the Elder began the first of the now celebrated galleries of Florence, and to him is due the conception of the museum in its modern signification. Pope Julius II. founded the museum of the Vatican. During the 16th and 17th centuries the museum mania led to the stripping of the provinces of works of art, which were collected in the capitals; and thus were begun the great museums and galleries in nearly all the

leading cities on the continent. Besides paintings and statuary, many of the museums comprise collections of bronzes, medals, gems, cameos, and intaglios. The Ashmolean museum in Oxford, founded about 1680, is the oldest in England; and the British museum in London, established in 1753, is the most important in the world. In some of the European cities there are special repositories, like the Thorwaldsen museum in Copenhagen and that in Paris established by Plon in the Louvre in 1875. The celebrated collections are described in this Cyclopædia under the names of the cities in which they are situated; and the more prominent, such as the British museum, the Louvre, and the Vatican, are described under their own titles. There are also special museums, which are mentioned in connection with the places or institutions to which they belong.

MUSGRAVE, George. See supplement.

MUSHROOM (Fr. *mousseron*, from *mousse*, moss, because mushrooms are often found growing in it), the name of several edible fungi, chiefly of the genus *agaricus*. The genus is large, and contains the most highly organized forms found among fungi; the number of species known to be edible is few; untested agarics, and those known to be poisonous, together with other fungi of similar appearance, are popularly called toadstools. The agarics have an abundant mycelium, known to gardeners as the spawn, consisting of white, cottony filaments, which spread in every direction through the soil; this, which is the vegetative portion of the plant, grows quite out of sight. That which is popularly recognized as the mushroom corresponds to the inflorescence in other plants; this appears upon the mycelium as a small knob, and soon pushes its way to the surface, where it is at first nearly spherical, but it rapidly develops and shows its various parts. There is a stem, bearing at its top an expanded, umbrella-shaped portion, the *pileus* or cap. In the button state, the covering or skin of the cap (*volva*) is attached to the stem, but as the cap expands this breaks away, leaving a fragment upon the stem, known as the ring or *annulus*. Upon the under side of the cap are numerous thin vertical plates, radiating from the stem, but not attached to it; these are the *hymenium*, popularly called the gills; a thin transverse section of one of these plates, when highly magnified, shows its surface to be studded with large cells terminating in four points, each of which bears a spore. The different species of *agaricus* present great variety in the form and size of the cap, and the color and character of its surface; the gills and the spores vary in color, which serves to divide the genus into groups according as they are white, pink, rust color, purplish brown, or black. Mushrooms grow wild in Europe and America, and a majority of the edible spe-

cies are common to both. In the articles FUNGI and LYCOPERDON reference is made to the recent attempts of English naturalists to increase the list of edible fungi, and to popularize them as articles of food. In this place are enumerated the principal species which have received the name of mushroom, and are common to both England and the United States.—Locality appears to have much to do with the quality of mushrooms. Some of the agarics which are highly esteemed in England have here proved unpalatable, and the common mushroom, *A. campestris*, so generally eaten elsewhere, is not only rejected in the markets of Italy, but is regarded with dread. This varies considerably, but in all cases is to be distinguished by its white, firm, solid stem, its fleshy cap, and its pink gills; when the cap begins to expand the gills are pale, but they soon become pink, and on this account it is in some parts of this country

being them with salt and flavored with spices. The general testimony is that mushrooms are highly nutritious, but difficult of digestion, and unsuited to persons with delicate stom-

Horse Mushroom (*Agaricus arvensis*).

achs.—The horse mushroom (*A. arvensis*), called snowball in the southern states, has a hollow stem, with a broad, pendulous ring; a slightly conical cap; the gills brownish white, and never of the pure pink color of the preceding; while the common mushroom rarely excels 3 or 4 in. across, this is sometimes more than a foot; it turns brownish yellow when broken. This species is quite common, and in English markets is much more abundant than the other. The parasol agaric (*A. procureus*) has a stem 6 or 8 in. high, hollow, with a loose pith, and tapering upward from a pear-like bulb at the base; ring loose on the stem;

Common Mushroom (*Agaricus campestris*).

known as the pink-gill; when older the gills become chocolate-colored and then tawny black, in which state they are regarded as unfit for food. It has a pleasant and characteristic odor, by which those familiar with it can distinguish the plant. This species is found in pastures, and in some years in great abundance; its proper season is September and October, when our markets are abundantly supplied from the wild growth; at other times cultivated mushrooms are to be had, but at very high prices. This is the only species cultivated. Mushrooms resemble flesh in flavor more nearly than do any other vegetables, and it is asserted by Badham that they contain similar proximate principles. They are used to form a dish by themselves, either stewed, broiled, or baked, and are largely employed to flavor other dishes, entering into a great variety of stews, fricassees, and sauces; many are consumed in the preparation of catsup, which is the juice of the mushrooms extracted by sprin-

Parasol Mushroom (*Agaricus procureus*).

the cap when expanded is 3 to 7 in. across, with a blunt point in the centre, and with a brown and more or less torn cuticle; gills white. According to the late Mr. Curtis, this

when fresh has the flavor of a hazel nut, and he calls it the nut mushroom; he considers that this flavor, together with the movable ring upon the stem and the brown color, will allow of its ready identification. In England this ranks as one of the finest flavored, and those who have tried it here coincide in the opinion. *A. prunulus*, *A. rubescens*, and *A. nebularius* are species common to both England and the United States. The favorite mushroom of Italy, *A. Cesareus*, regarded as the most delicious of all fungi, was found abundantly in North Carolina by Mr. Curtis, who called it the imperial mushroom.—The French call all mushrooms *champignons*, but in England the name is restricted to the fairy-ring champignon, which is by some called *agaricus oreades*, and by other authors it is placed in the genus *marasmius*. The fairy rings which are so common in pastures and lawns in England are circles of bright green in the grass of a few feet to several yards in diameter; these are produced by the mycelium of fungi which, having exhausted the soil within the ring, is constantly spreading and enlarging the circle. The champignon is the most important of these fungi; it is only 1 or 2 in. in diameter, with a very tough stem; the cap is dull fawn color when moist, and when dry creamy white, with the gills of the same color, broad and far apart. A very acrid champignon, *A. urens*, has a similar appearance, but the gills are narrow and much crowded. The champignon is one of the most

structures, being of wood and underground, decayed and fell to ruin before the success of

Chantarelle (*Cantharellus cibarius*).

the project was established. Occasionally a florist may make a bed for mushrooms under the stage of his greenhouse, and from these and other sources there is a scanty supply of fresh mushrooms; but except during the autumn months restaurants and hotels depend upon those imported from France in sealed tins. The mushroom appears to be dependent upon the horse, it being supposed that the spores are taken into the animal with the grass it eats, and germinate in the droppings; the manure of horses and cattle is the medium in which the mycelium of the mushroom flourishes most vigorously; hence in cultivation an abundant supply of this is required, and also a stock of mycelium or spawn. The earth of riding schools, or that from the track of a horse mill, in which the droppings of the horses are thoroughly beaten into the soil, is found to afford an abundant supply of spawn; when once obtained it can be multiplied to any extent, and, as it retains its vitality when dry, can be transported; that sold in this country comes from Europe. Horse and cow droppings and loam are mixed together and formed into blocks like large bricks; when these are partly dry, a hole is made in each and a small piece of spawn inserted; the bricks are then placed upon a hotbed and kept at a temperature of 60° F. until the whole mass of each is permeated by the threads of the mycelium; further development is then checked by completely drying the bricks, and afterward they are stacked away in a dry place for use or for sale. Mushrooms are grown in houses built for the purpose, in out buildings, cellars, caves, or wherever a uniform temperature of between 50° and 60° can be maintained. Cultivators vary so much as to details that general principles only can be stated. Some use pure horse droppings, others mix these with those of cattle; the beds are made of the fermenting manure built up solidly and large enough to maintain a heat of about 70°. The bed being of

Fairy Ring Champignon (*Marasmius oreades*).

highly flavored fungi, and may be kept in the dry state for years without losing its aroma.—The chantarelle (*cantharellus cibarius*), one of the esteemed rarities in England, was found in great abundance in North Carolina, but was not relished by Mr. Curtis or his friends. Mr. Curtis in a letter to the Rev. Mr. Berkeley stated that he had eaten 40 species of edible fungi collected within two miles of his residence, and that he had detected 111 kinds in North Carolina alone.—The cultivation of mushrooms, which is so largely practised abroad, is in this country mainly confined to private gardens; an attempt was made by the late Prof. Blot to cultivate them on a commercial scale, but his

the proper temperature, bits of a brick of spawn are inserted in it at intervals, and when

Mushrooms grown in a Cask.

the mycelium is growing rapidly, or the spawn "runs," about two inches of soil are placed upon the bed, and it is then covered with straw; water is applied if necessary, and it should be warmed to the temperature of the bed. Mushrooms appear in six or eight weeks, and are collected when in the button state or larger as required; it injures the bed to cut the mushrooms, hence they are twisted off. Instances are given of successful cultivation in tubs made by sawing a cask in two, in boxes which are stacked upon each other, upon shelves

Mushroom Cave.

in a stable, and in other unusual places. In England beds are profitably made in the open air, but with us the extremes of temperature are too great for this kind of culture. Mushroom culture is conducted upon the largest scale in the vicinity of Paris, where there are extensive caves formed by the removal of building stone; these caves are from 20 to 60 ft. deep and of great extent; one of them contains 16 m. of mushroom beds, and in another the beds measured one year over 21 m. in length. As the plant does not require light, and as these caves have the requisite uniformity of temperature, they are utilized by the mushroom cultivators, who, notwithstanding

the labor and difficulty of bringing the immense quantity of manure to the spot, find it a profitable business. One of the large quarry plantations when in full bearing sent 3,000 lbs. of mushrooms to the Paris market daily.—Notwithstanding the efforts that have been made abroad to add various neglected fungi to the food supply, the fact that there are many which are highly poisonous has confined the use of all but the commoner species to a very few enthusiastic amateurs. Unfortunately there is no general rule for distinguishing the wholesome from the harmful; the colors produced by contact with a silver spoon or by the action of salt have been proposed, but are fallacious, and the only guide to be relied upon is an eye educated to observe the peculiarities of structure, color, &c., which characterize the various species. As a general rule, the wholesome fungi have an agreeable smell and taste, and all those with a repulsive odor and an acrid taste in the fresh state should be rejected.—Most of the general treatises upon gardening have a chapter on mushrooms. Descriptions of species will be found in Badham's "Esculent Funguses of England" (London), Cooke's "Handbook of British Fungi" (2 vols., London, 1871), and the numbers of the "Gardeners' Chronicle" (weekly, London) for several years past. For cultivation, see Robinson's "Mushroom Culture" (London, 1870).

MUSIC (Gr. *μουσα*, a muse), an agreeable combination and arrangement of sounds, and the art of so combining and arranging sounds. It is indispensable to have some knowledge of the nature of sounds before we begin the consideration of the manner in which they are arranged and compounded in music. We here give only that information which is essential to the understanding of the subject of this article, referring the reader to the article **SOUND** for a discussion of the nature of sonorous vibrations and of their properties. The more rapidly the sonorous pulses of the ear follow each other, the higher is the pitch of the sound perceived. Thus, the gravest sound which is really musical is caused by 40 vibrations a second, while the auditive sensation the highest in pitch is produced by about 40,000 a second. But the sounds employed in music have not so extended a range; they are practically embraced by about seven octaves, extending from 40 vibrations to about 5,000 a second. The gravest sound of an orchestral instrument is the E of the contra-bass, of 40 vibrations a second. Modern pianos and organs indeed give generally the C (of 33 vibrations) below the E of the contra-bass; and some recent grand pianos extend as low as the A (of 27 vibrations) in the next lower octave. In the largest organs there is also sometimes a pipe which gives a sound that descends into the yet lower octave, reaching the C of $16\frac{1}{2}$ vibrations. But none of these grave sounds below the E of the contra-bass can be termed musical; for the separate pulses which compose them do not

blend into smooth continuous sensations, but produce beats, corresponding in number to the rate of vibration indicated above. These grave sounds cannot be used alone, but are always sounded in unison with pipes or instruments giving their higher octaves and harmonics. Thus the latter are compounded with the harsh fundamental of the grave note, and at the same time blend with any harmonics which may accompany the fundamental of these grave sounds. In the higher regions of musical sounds, pianos give the notes A and even C, of 3,520 and 4,224 vibrations. The most acute sound of orchestral music is the D (of 4,752 vibrations) of the piccolo flute.—There are three distinctions to be made among sounds: their pitch, of which we have just spoken; their intensities, concerning which it is not necessary to enlarge; and their *timbre*, or that character by which we distinguish between sounds having the same pitch and intensity. All simple sounds, which we define as those having only one pitch, have the same timbre. Such are the sounds given by flue organ pipes, or by tuning forks when mounted on resonant boxes. But the sounds employed in music are always composite, being formed of several simple sounds whose numbers of vibrations are to each other generally as 1, 2, 3, 4, &c. Simple sounds are unfit for musical expression by reason of their want of brilliancy; for this reason the notes of closed flue pipes are rarely sounded alone, but to invest their tones with feeling and life they are combined with other stops, giving the harmonics or furniture of their simple sounds. The sounds of the flute approach in character those given by closed organ pipes; but when associated with other instruments which bring out the sequence of the harmony, the flute, by reason of the perfect softness of its sounds and the facility with which it renders rapid movements, is charming, and cannot be replaced by any other instrument. It held a far more important place in ancient than in modern music; but even among the ancients the abler masters preferred the more thrilling sounds of stringed instruments. The sounds of all other instruments, as well as the notes of the human voice, are composite, formed by the blending of several simple sounds, having different positions in the musical scale. (See HARMONY.) Helmholtz has proved that the distinctive timbre of any given sound is due to the number and relative intensities of its elementary sounds, or harmonics.—Stopped wooden flue pipes of large section give nearly simple sounds when blown with a feeble pressure. An increase of pressure in the blast develops the third harmonic, and an excessive pressure may injure the timbre of the sound by giving to it too great an intensity compared with that of the fundamental; it may even cause the latter to disappear, and then the whole sound will have risen in pitch by an octave and a fifth. Stopped organ pipes having small area of section

compared with their lengths give the fifth harmonic as well as the first and third. In other words, closed pipes give the uneven harmonics; open and narrow pipes give the complete series of harmonics up to a certain number. Thus, if we close all the holes in a flute and blow gently, and then with increasing intensity, the instrument will successively give the first, second, third, and fourth harmonics. In the case of the narrow open pipes in the organ (viola, principal, violoncello, contra-bass, viola-di-gamba), powerful pressure of wind gives the fundamental sounds of these pipes accompanied by the clear sounds of all the harmonics, including the sixth. It is quite otherwise in the case of the large open pipes. From the considerable mass of air which they contain, and from the fact that they do not readily jump in their pitch from the fundamental to one of the harmonics on increasing the wind pressure, these large pipes form the basis of the mass of sounds of the organ, and hence they have been called the principal register. In these pipes the fundamental sound is intense, and is accompanied by a few harmonics of feeble intensities. In the flute or chimney pipes, the timbre receives a brilliant character from a small open pipe adapted to the top of these closed pipes. By combining the stops on the organ, one can produce a great variety of timbre; and in this regard the organ has the advantage over all other musical instruments. Vibrating plates, or reeds, are used in the reed pipes of the organ, in the melodeon, and in the clarinet, hautboy, and bassoon; while in the horn, trumpet, trombone, and cornet the lips perform the office of the reed. The sounds of all reed instruments are peculiarly rich in harmonics; it is not difficult to distinguish those even as high as the twentieth. The fundamental, or some powerful harmonic, is generally reinforced in reed organ pipes by surmounting them with open or partly closed tubes of various sizes and forms; and thus are obtained the various timbres of these instruments, such as the trumpet, *vox humana*, &c. The clarinet gives only the odd series of harmonics, 1, 3, 5, 7, &c., while the hautboy and bassoon give the entire series, 1, 2, 3, 4, &c. If the hautboy takes one note of an interval and the clarinet another, some concords will sound best when the former instrument, others when the latter takes the upper note. Among stringed instruments those of the violin kind occupy the highest place. The tones of these are highly complex, containing the clear sounds of the higher harmonics from the sixth to the tenth; and as violins do not, like the piano, give fixed sounds evolved by a keyboard, they have great sonorous flexibility, giving the performer the power of playing in any mode or scale, and of gliding from one note to another without perceptibly breaking the continuity of the sound; and above all, he can obtain any note with varying intensity, and thus express his feelings by the most exquisite modulation.

When the violin is well played, the fundamental or lowest harmonic comes out with force, and the harmonics up to the sixth are feebler than in the cases of the guitar, harp, or piano; but the sixth and higher harmonics are stronger than in the case of the latter instruments. On examining with a vibration microscope the forms of the vibrations of the strings, Helmholtz found that in instruments of the highest excellence these forms remained constant during the whole duration of the tone. To this great regularity in the vibrations he attributed the purity of the sounds of old instruments; and for the same reason the strings can be sounded with more force. In the piano the sounds are composite; the lower harmonics are relatively stronger than in the violin, but the harmonics above the sixth, which in the main form dissonant combinations with those

below the sixth, are purposely prevented from appearing in the sounds of this instrument, by causing the hammers to strike the strings at points distant from the ends of the strings about one seventh of their length. The sounds of the harp and guitar differ from those of the piano; for in these instruments we have catgut strings which are pulled aside from their positions of equilibrium, and then allowed to vibrate freely; in such circumstances the higher harmonics, which appear in the first swings of the cords, soon disappear from their sounds. But no instrument emits sounds so smooth, so clear, and so touching as those of the human voice. The voices of men are classed as bass, barytone, and tenor; those of women as contralto, mezzo-soprano, and soprano. The position on the musical scale and the range of these voices are given as follows in musical notation:

We thus see that ordinary voices do not include two full octaves. The range from the lower F of the bass to the higher G of the soprano is a little more than three octaves. These limits, however, have been extended in exceptional cases. Prætorius, in his *Syntagma Musicum*, says that in the 16th century, in the time of Orlando di Lasso, there were at the court of Bavaria three basses, the brothers Fischer and one Gassner, who sang the F_{-1} ; while the highest note ever recorded is that attained by Lucrezia Ajugari, called La Bastardella.

Mozart, who heard her at Parma in 1770, gives several passages which she sang for him. We copy the last of them, which ends in C_6 :

She trilled on the D_6 and performed other extraordinary feats. Mozart's father says that La Bastardella sang these passages with a little less force than the lower notes, but that her voice remained as pure as a flute. She could descend easily as far as G_2 . Kuhlau wrote for a songstress who astonished St. Petersburg in 1823 the part of Adelaide in his opera of *Le château des brigands*. The dominant air in the third act reaches as high as A_6 . "At one representation, just as she was about to give the perilous note, the leader of the orchestra looked at her fixedly, which so disconcerted her that she gave C_6 ." The voice of Gaspard Forster embraces three octaves, from A_{-1} to A_6 ; while that of the younger of the Sessi sisters extends through three octaves and a half, from C_2 to F_6 . Catalani's voice had likewise a compass of three and a half oc-

taves, as also had the voice of Farinelli, who went from A to D_6 .

Very remarkable heights have likewise been reached by Nilsson and Carlotta Patti. At the age of puberty the glottis of man suddenly enlarges, and the voice ordinarily descends in pitch an octave. This change does not take place in castrates; their voices remain as in their childhood, and are distinguished by an indescribable flute-like quality. But cases are on

record where the voice has never acquired the pitch characteristic of manhood; thus, M. Dupont, who often sings at the celebration of high mass in Paris, has a remarkably fine soprano voice, yet he is 36 years old (1874), and is the father of several children.—In music we consider the ratios of the numbers of vibrations of definite sounds more than the absolute number of the vibrations, or pitch, of these sounds. From the most ancient times it has been known that the most harmonious concords are produced by means of the simultaneous sounding of strings whose lengths bear to each other simple ratios. Pythagoras, who probably derived the fact from the Egyptians, says that when the ratio of the lengths of the strings was as 1 : 2, the grave note sounded in unison with its octave, while the ratio 2 : 3 gave the *quint*, and 3 : 4 gave the *quart*. We now know that the numbers of vibrations of similar strings are inversely as their lengths, so that the existence of the above consonant intervals depends alone on the ratio of the vibrations of the strings, and not on the absolute number of vibrations of the fundamental note of the chord. (See HARMONY.) When we double the number of vibrations corresponding to a note, we obtain the octave of this note, and the sensation caused by this higher octave seems to repeat that which corresponded to the lower. This interval of the octave, which includes all the notes of any musical system, is established by our physiological constitution, and was determined long before it was known that to obtain the octave of a note we had to double the number of its vibrations. Modern science has shown that the following musical consonances are only obtained when their constituent notes have the following vibration ratios: octave, 1 : 2; fifth, 2 : 3; fourth, 3 : 4; major third, 4 : 5; minor third, 5 : 6; major sixth, 3 : 5; minor sixth, 5 : 8. Within the compass of the octave are seven distinct steps of pitch, constituting the gamut. We here give the names of the notes of the natural gamut in English and German, and in Italian and French notation. Under these names we give the relative numbers of their vibrations in whole numbers and in fractions; and in the succeeding line are the intervals between the notes of the gamut:

Names.	{	C	D	E	F	G	A	B	C
	{	<i>ut</i> or <i>do</i>	<i>re</i>	<i>mi</i>	<i>fa</i>	<i>sol</i>	<i>la</i>	<i>si</i>	<i>do</i>
Ratio of vibrations.	{	24	: 27	: 30	: 32	: 36	: 40	: 45	: 48
	{	1	: $\frac{3}{2}$: $\frac{5}{4}$: $\frac{4}{3}$: $\frac{3}{2}$: $\frac{5}{3}$: $\frac{15}{8}$: 2
Intervals between successive notes.	{	$\frac{9}{8}$	$\frac{10}{9}$	$\frac{16}{15}$	$\frac{9}{8}$	$\frac{10}{9}$	$\frac{8}{7}$	$\frac{16}{15}$	

The gamut does not suppose a knowledge of the absolute height of the notes; it only fixes the ratios. The first note, or tonic, can have any pitch; but once fixed upon, all the others must follow in the ratios of the above numbers; thus, if C makes 240 vibrations, then D in the same time must give 270, E 300, F 320, and

so on. One gamut is continued by a second, formed by simply doubling the numbers of vibrations constituting the first, and another by doubling the vibrations of the second, and so on. The ratios between the successive notes of the gamut and the first note, or tonic, are denominated their musical intervals. In the following table we give the names of the intervals preceded by the names of the notes. These intervals are designated by the position of the notes in the gamut:

C : C	Unison	1 : 1
C : D	Second	8 : 9
C : E	Third	4 : 5
C : F	Fourth	3 : 4
C : G	Fifth	2 : 3
C : A	Sixth	3 : 5
C : B	Seventh	8 : 15
C : C ₂	Octave	1 : 2
C : D ₂	Ninth	4 : 9
C : E ₂	Tenth	2 : 5
C : F ₂	Eleventh	3 : 8
C : G ₂	Twelfth	1 : 3
.....
C : C ₃	Double octave	1 : 4
.....
C : E ₃	Seventeenth	1 : 5
.....
&c.	&c.	&c.

The first six notes received their present Italian names from the Benedictine Guido Aretino in 1026. They are the first syllables of the words taken from the following stanza of the hymn to St. John the Baptist:

UT queant laxis *RE*sonare fibris
*MI*ra gestorum *FA*muli tuorum,
*SO*lve polluti *LAB*ii reatum,
 Sancte *JO*hannes.

The air to which this hymn is now sung at Rome on St. John Baptist's day is altogether different from that used by Guido, for in ancient times the six syllables were sung to the notes which these syllables designated. The word *si*, derived from the fourth line (S and I), was first used by François Lemaire in 1684 to designate the seventh note of the gamut. The use of these words in solmization caused the Italians to change the *ut* into *do*. These names for the notes did not spread very rapidly, for during the time of Jean de Muris, in the 14th century, they still sang at Paris the syllables *pro*, *to*, *no*, *do*, *tu*, *a*; but finally Guido's names prevailed, except in Germany and England, where the notes are generally designated by the letters C, D, E, F, G, A, B (or H). The origin of the latter nomenclature is as follows: Before the 6th century, certainly during the time of Gregory the Great, they formed a series of gamuts corresponding to the ordinary range of the notes of the human voice, and of the principal musical instruments then in use. The notes were designated by the first seven

letters of the alphabet, in this manner: A, B, C, D, E, F, G; a, b, c, d, e, f, g; aa, bb, cc, dd, ee. Subsequently they added another note lower in pitch than those already embodied in their system, and this note was indicated by the Greek *gamma* (γ), whence the name gamut. Others say that gamut comes from the fact that the letter γ was placed on the lowest line of the staff. Guido replaced the letters by points which he wrote on parallel lines (the staff), each of which belonged to a certain letter, called the key or clef of that line. Thus when an F had been written at the beginning of a line, it indicated that all points on that line represented the note F. Afterward they enlarged these points, placed them between the lines, and increased the number of the lines and spaces as they were needed. In order to indicate a chord, or the simultaneous sounding of two or more notes, these notes were placed one below the other, and from this method of notation arose the name of counterpoint, or the science of accords. Musical notation at first only indicated the heights of the various notes on the musical scale; in 1338 De Muris invented squares to indicate their duration. This system was improved by Ottavio Petrucci (1470), who in 1502 was the first to print music by means of movable types. The syllables *do, re, mi, fa, sol, la* did not originally stand for fixed notes, but simply the degrees of any gamut whatever. They stood for the hexachord of Guido, and were written below the letter which designated the fixed gamuts, beginning with C, with F, or with G:

C	D	E	F	G	A	B	c	d	e	f	...
do	re	mi	fa	sol	la
.	do	re	mi	fa	sol	la
.	.	do	re	mi	fa

Thus the same note could occupy different positions in the movable gamut, which was often incompatible with the preservation of the established intervals of the notes, *do, re, mi, fa, sol, la*. Hence arose different modes, more or less harmonious, and a great confusion in the ancient system of music. They then felt the necessity of changing slightly the pitch of certain fixed notes when, by the transposition of the movable gamut, the intervals of the corresponding fixed notes did not give the intervals originally given to the series *do, re, mi, fa, sol, la*. Thus, when *do* was written below F, and *fa* below B, the interval of F to B should have been a fourth; but as in reality it was greater, they diminished it by flattening B a semitone. The latter note was then called *B molle*, while it was *B durum* in the gamut which began in C. They indicated these changes by writing a *b*, round or square, and this is the origin of the signs \flat and \natural . The origin of these signs is shown in the French language, in which they are respectively termed *démol* and *bécarre*. By many modifications musical notation grew into the present system.—The signs now em-

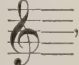

ployed in music denote the length, pitch, and force of tones, or rhythm, melody, and expression. The length of a note is represented by its shape. The notes are the breve  or , semibreve , minim , crotchet , quaver , semiquaver , demisemiquaver , and demi-quaver , but the first and last of these are

little used. The breve is twice as long as the semibreve, the semibreve twice as long as the minim, and so on. A dot following a note lengthens it one half, thus, $\dot{\text{c}} = \text{c} + \text{half c}$. Rests, indicating silence, are: — , equal in length to c , or a whole bar; — = c ; — = c ; — = c ; — = c ; — = c ; — = c . Rhythm is fur-

ther marked by the division of time into measures of equal length indicated by vertical lines drawn across the staff. Measures again are divided into two, three, four, or six parts, and the first part of a measure is almost always accented. There are four measures in common use: double, triple, quadruple or common, with a secondary accent on the third part, and sextuple, with a secondary accent on the fourth part, each represented by figures placed at the beginning of the staff, as follows:

$\frac{2}{4}$, $\frac{3}{4}$, $\frac{4}{4}$ or C , and $\frac{6}{4}$ or $\frac{6}{8}$.

Thus, taking the crotchet as a standard, in double time there must be two crotchets or their equivalent in every bar or measure, in triple three, in quadruple four, in sextuple six. There are exceptions to these rules, however, and even five crotchets to a bar have been used with eccentric effect.—The pitch of a tone is determined by its position on the staff, which consists of five parallel lines and the four intervening spaces, and by the clef, which indicates the pitch of all the notes on one line or space of the staff, whence the rest are easily found. In the early Italian school every kind of voice had its own clef, but at present only two are in general use, the treble or G clef

of the violin, , and the bass or F clef,

. In some musical scores, however, par-

ticularly Italian, the C clef is retained for the tenor and alto parts. For the former it is placed

on the fourth line, , which thus be-

comes the position of C, and for the latter on the third, . The popular plan in wri-

ting music in four parts is to put the alto on the same staff with the treble, and the tenor with the bass or treble. With these staves, and the aid of short lines called leger lines above and

below the staves, we are able to represent all the notes of the human voice, and even more. The following is the musical scale from the lowest bass note to the highest soprano:

The pitch of any note may be raised half a tone by means of a sharp (#) placed before it, or lowered half a tone by a flat (b). When a sharp or flat is placed on a line or space at the beginning of a staff, it affects every note occurring on that line or space and its octaves throughout the piece. A natural (♮) restores to its normal pitch a note affected by a flat or sharp. A note or passage may be raised or lowered an octave by writing over or under it the sign 8va. ----- Besides the words *forte*, *fortissimo*, *piano*, *pianissimo*, and their abbreviations, *f.*, *ff.*, *p.*, *pp.*, indicating that a note or passage is to be given loud, very loud, soft, or very soft, there are the signs < (*crescendo*), denoting a tone gradually increasing from soft to loud; > (*diminuendo*), the reverse of crescendo; > (*sforzando*), an explosive tone

instantaneously diminished;

(*staccato*), a short articulate utterance as if each

note were followed by a brief rest; and

(*legato*), a binding together of successive tones. The system of musical notation adopted indicates to the performer the pitch, the duration, and in an imperfect manner the intensity of musical sound, but conveys no idea of the timbre or composition of these sounds. A musical note, indeed, gives merely the pitch of the fundamental or first harmonic of a musical sound. This defect is unavoidable, and to the musician is generally of little consequence; for in concerted music the parts are written for special instruments, whose qualities of sound are well known to the musical ear.—It was only after ages of experience, and many changes, that the system of music reached its

present condition. The principal problem was this: Whatever the note selected from the scale to begin the gamut, the other notes when combined with the former shall give the established musical intervals. In order to solve this problem, the fixed notes were altered, either by elevating them in pitch by a semitone, which operation is called sharpening a note, and is indicated by the sign #, or by lowering them a semitone in pitch, which is to flatten a note, and is indicated by the sign b. For the value of this semitone the interval $\frac{3}{4}$ has been adopted, which is smaller than the ratio $\frac{1}{2}$, the value of the interval E F. The notes C, D, E, &c., are given by the white keys of the piano and organ, while the black keys give the sharps and flats. The gamuts are always designated by the name of their first note, or tonic. All the gamuts called major are modelled on the primitive gamut of C, formed by the series of natural notes, C, D, E, &c. The gamut of G is formed of the notes G, A, B, C, D, E, F#, G; that of F, of the notes F, G, A, Bb, C, D, E, F. These gamuts constitute the major mode. Music, however, requires also a minor mode, formed of gamuts whose type is the gamut of A minor: A, B, C, D, E, F, G, A. The principal difference between the two modes consists in the introduction of the minor third, A—C (5 : 6), in the place of the major third, C—E (4 : 5). They are both characterized by a perfect accord, formed with the third and fifth of the tonic, as follows:

Perfect major accord, C E G.

“ minor “ A C E, or C Eb G.

The major and minor scales give us a series of 11 notes, which, severally combined with the tonic, form 10 distinct intervals. In musical notation they are as follows:

In the minor mode we are often obliged to elevate by a semitone the seventh and also the sixth note of the gamut. To obtain absolute purity, all gamuts on an instrument of fixed sounds, like the organ or piano, would require an extraordinary, indeed an almost impracticable complication. Mr. A. J. Ellis has shown in a paper published in the "Proceedings of the Royal Society," vol. xiii., "On a perfect Musical Scale," that within the compass of an octave 72 notes would be required to give an absolutely perfect command of all the keys that are now used in music. It has therefore been found necessary to make a compromise, in perfect harmonious effects, in the construction of instruments with fixed sounds; and thus has come about the universal adoption of the musical scale known as that of "equal temperament," so called because between any two contiguous notes the same interval (called a semitone) exists throughout the whole scale. As the octave is divided into 12 equal intervals, it follows that each of these

intervals is equal to $\sqrt[12]{2}$, or to 1.05946. This scale being a compromise, the major triads are slightly dissonant. Thus, in the natural scale the ratio of the vibrations of G : E : G are as 1 : 1.25 : 1.5; but on the scale of equal temperament these same notes bear to each other the vibration ratios of 1 : 1.2599 : 1.4983. Thus it follows that the interval of the major third is sharpened, while the fifth is flattened. If we take the middle octave of the piano for an example, we shall find that E and A are three vibrations a second too sharp, while the fourth and fifth are out of tune by one vibration a second. For convenience of comparison we here give the two scales. The natural scale is placed below the scale of equal temperament. The numbers of vibrations in a sound, correct to the nearest unit, are written under the notes. When the vibration number is a fraction more or less than the number given, the sign + or — is respectively attached to the number. The notes belong to the middle octave of the piano.

C	C#	D	D#	E	F	F#	G	G#	A	A#	B
264	280—	296+	314—	333—	352+	373+	395+	419+	444—	470+	498+
C	D	E \flat	E	F	G	A \flat	A	E \flat	B		
264	297	317—	330	352	396	422+	440	469+	495		

The ratio of the semitones of the tempered scale is approximately $\frac{1}{12}$, and a tone on this scale barely differs from the major tone of $\frac{2}{3}$. This invention has been variously attributed to Neidhart and Werckmeister, to Sebastian Bach, and to Lambert the geometrician. This musical scale was first applied to the clavichord, and Emanuel Bach, son of Sebastian, said a well tuned clavichord was the most accurate of all instruments; this remark is readily understood when it is explained that, from the manner of production of the sounds on this instrument, the higher harmonics, even when evolved, are feeble and soon die out from the sounds, while the resultant tones appear only at the moment the chords are forcibly struck. But all organists know how harshly intervals are given on a stop of reed pipes, or on the furniture register, tuned to the equal-tempered scale. This harshness is due to the imperfect tuning causing the beating of harmonics and resultant tones. An excellent method of comparing the relative effects of natural and of tempered tuning is to listen to a few voices singing a series of sustained chords of three or four parts without accompaniment, and then listen to exactly the same chords with the accompaniment of a piano or melodeon. In the latter case the harshness of the accompaniment is forcibly brought out. One naturally sings perfect intervals, and a violinist with a refined ear will involuntarily play on the natural scale; but if the voice is educated by the accompaniment of the piano instead of the violin, and if the violinist is always accompanying the fixed

tones of an orchestra, then they will both have acquired the habit of rendering the false intervals of the tempered scale.—The vibration fraction of an interval expresses the ratio of the numbers of vibrations performed in the same time by the two notes which form the interval. Thus, the vibration fraction $\frac{2}{3}$ means that while the lower of the two notes, forming a major third, makes four vibrations, the higher of these notes makes five. Therefore, while the lower makes one vibration, the higher makes five fourths of a vibration, or one vibration and a quarter. Conversely, while the higher note makes one vibration, the lower makes four fifths of a vibration. This reasoning is general, and hence follows this rule: Any fraction greater than unity denotes the number of vibrations, and fractions of a vibration, made by the higher of two notes forming a certain interval while the lower note is making a single vibration. Similarly, any fraction less than unity indicates the proportion of a whole vibration performed by the lower note while the upper is making one complete vibration. The rules for adding and subtracting musical intervals are as follows: To find the vibration fraction for the sum of two intervals, multiply their separate vibration fractions together. To find the vibration fraction for the difference of two intervals, divide the vibration fraction of the wider by that of the narrower interval. Thus, a major third added to a fifth gives a major seventh; while a major third subtracted from a fifth leaves a minor third. One of the most common applications of the second rule

is when an interval has to be inverted. The inversion of an interval less than an octave is the difference between it and an octave; *i. e.*, the interval which remains after the first has been subtracted from an octave. Thus, to invert the minor third we divide 2 by $\frac{3}{2}$; or, in other words, we invert the vibration fraction of the interval and multiply by 2. This operation gives us $\frac{5}{3}$; therefore, the inversion of the minor third is the major sixth. Evidently there exists a mutual relation between an interval and its inversion, so that each is the inversion of the other. Thus, the inversion of the major sixth is the minor third. The following three pairs of consonant intervals, embraced within the compass of an octave, have to each other the mutual relation of inversions:

Minor third, . . . $\frac{6}{5}$ — Major sixth, . . . $\frac{5}{3}$
 Major third, . . . $\frac{4}{3}$ — Minor sixth, . . . $\frac{3}{2}$
 Fourth, . . . $\frac{4}{3}$ — Fifth, . . . $\frac{3}{2}$

—Musical sounds of different pitch, simultaneously emitted, form a chord. Chords formed of two notes are called binary chords; those of three notes are called triads. A binary chord is consonant when its two notes form a consonant interval. In a triad there are three intervals: one between its lowest note and the next higher, one between the middle and highest note, and one between the lowest and highest. The triad is only consonant when all three of these intervals are concords. Therefore, to form consonant triads we select a note, then find the others, each of which forms with the bottom note a consonant interval. We then determine whether the interval between the two higher notes is a consonant one; if this be so, then the triad is consonant. To determine all of the consonant triads contained in an octave, above any selected bottom note, we must assign to the middle and top notes every possible consonant position with respect to the fixed bottom note, and reject all such relative positions as give rise to dissonant intervals between those notes themselves. The remaining positions will constitute all the consonant triads which have for their lowest note that originally selected. The intervals at our disposal are: for the mid-

dle note, from the minor third to the minor sixth; and for the upper note, from the major third to the major sixth. In the following table the possible positions of the middle note with respect to the bottom note are shown in the left-hand vertical column, the name of each interval being accompanied by its vibration fraction. The possible positions of the top note are similarly shown in the top horizontal line. Each space common to a horizontal and vertical line contains the vibration fraction of the interval formed between the simultaneous positions of the middle and upper notes named at the beginning of these lines. The intervals thus formed which are dissonant are designated by being enclosed in brackets. Whenever they are consonant the name of the interval is given.

	Major third. $\frac{4}{3}$	Fourth. $\frac{3}{2}$	Fifth. $\frac{3}{2}$	Minor sixth. $\frac{8}{5}$	Major sixth. $\frac{5}{3}$
Minor third. $\frac{6}{5}$	$\left[\frac{25}{24}\right]$	$\left[\frac{10}{9}\right]$	$\frac{5}{4}$ Major third.	$\frac{4}{3}$ Fourth.	$\left[\frac{25}{9}\right]$
Major third. $\frac{4}{3}$		$\left[\frac{16}{15}\right]$	$\frac{6}{5}$ Minor third.	$\left[\frac{32}{25}\right]$	$\frac{4}{3}$ Fourth.
Fourth. $\frac{4}{3}$			$\left[\frac{9}{8}\right]$	$\frac{6}{5}$ Minor third.	$\frac{5}{4}$ Major third.
Fifth. $\frac{3}{2}$				$\left[\frac{16}{15}\right]$	$\left[\frac{10}{9}\right]$
Minor sixth. $\frac{8}{5}$					$\left[\frac{25}{9}\right]$

An examination of the above tables shows that the following are all the consonances:

Middle note.	Upper note.
Minor third.	Fifth, or minor sixth.
Major third.	Fifth, or major sixth.
Fourth.	Minor sixth, or major sixth.

The above consonances are thus expressed in musical notation:

We thus obtain two groups of three major and three minor triads, which may be arranged thus:

- (a) { Fifth. (b) { Minor sixth. (c) { Major sixth.
 Major third. Minor third. Fourth.
 (α) { Fifth. (β) { Major sixth. (γ) { Minor sixth.
 Minor third. Major third. Fourth.

The above six consonant triads may be defined by the intervals separating the middle

from the bottom note, and the top from the middle note, instead of defining these intervals, as we have done above, by the intervals formed by their middle and top notes with the bottom note. To bring about this change we perform on each one a subtraction of intervals. Thus, the difference between a fifth and a major third is $\frac{3}{2} \times \frac{4}{3} = \frac{2}{1}$, or a minor third. In this manner we find that the top and middle notes are separated by the following intervals:

a	b	c	α	β	γ
Minor third.	Fourth.	Major third.	Major third.	Fourth.	Minor third.

Hence the two groups may be written as below :

(a') { Minor third. Major third.	(b') { Fourth. Minor third.	(c') { Major third. Fourth.
(α ') { Major third. Minor third.	(β ') { Fourth. Major third.	(γ ') { Minor third. Fourth.

It can now be shown that the triads of each group are closely connected. Take (a'), and form from it another triad, by causing its bottom note to ascend one octave, the other two remaining where they were. The middle will then become the bottom note, the top the middle note, and the octave of the former note the top note. Hence the lower interval of the new triad will be the upper interval of the old triad, *i. e.*, a major third. The upper interval of the new triad will necessarily be the inversion of the interval which separated the extreme notes of the old triad. This interval is

a fifth (see (a)), and its inversion by the table already given is a fourth. Hence the new triad

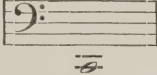

is { Fourth
Minor third }, which is identical with

(b'). If we modify (b') in the same way, the new interval is the inversion of the minor sixth, *i. e.*, the major third, and the resulting triad, viz., { Major third
Fourth }, is identical with

(c'). This triad, when similarly treated, brings us back to (a'), and the cycle of changes is complete. By an extension of the word "inversion," it is usual to call the triads (b') and (c') the first and second inversions of the triad (a'). Exactly similar relations hold between the members of the second group of triads; (β ') and (γ ') are accordingly called the first and second inversions of the triad (α '). The proof is exactly like that just given, and will be easily supplied by the reader. If we choose C as the bottom note of (a') and (α '), the major and minor groups will be expressed in musical notation by

They may also be defined in the language of thorough bass, which refers every chord to its lowest note, in accordance with the mode adopted in (a), (b), (c); (α), (β), (γ). Thus the triads (a'), (b'), (c') would be indicated by the figures $\frac{5}{3}$, $\frac{6}{3}$, $\frac{6}{4}$ respectively, and so would the triads (α '), (β '), and (γ '); the differences between minor and major thirds and sixths being left to be indicated by the key signature. The positions (a') and (α ') are regarded as the fundamental ones of each group, (b'), (c), and (β '), (γ ') being treated as derived from them respectively by inversion. The fundamental triads bear the name of their lowest notes; thus (a') and (α ') are called respectively the major and minor common chords of C. The remaining members of each group are not named after their lowest note, but after that of their fundamental inversion; thus (b'), (c'), and (β '), (γ ') are respectively the major and minor common chords of G in their first and second inversions. The reason of this, as far as the major group is concerned, follows directly from Helmholtz's theory of consonance and dissonance. The notes of the triads (a'), (b'), (c') are all coincident with individual harmonics of a composite sound whose funda-

mental tone is the low C  for

(a') and (b'), and the octave above that note for (c'); hence they may be regarded as forming a part of the composite vibration of a C sound, and therefore each triad may be appropriately called by its name. With the minor triads this is not so completely true, because the E \flat in (α '), (β '), and (γ ') is not coincident with an overtone of C. The other two notes, however, are in each case leading harmonics of C, and therefore these triads belong at any rate more to C than to any other note. Common chords of more than three constituent sounds can only be formed by adding to the consonant triads notes which are exact octaves above or below those of the triads. The bright open character of the major and the gloomy veiled effects of minor chords are attributed by Helmholtz to the different way in which combination tones enter in the two cases. The positions of the first order of combination tones, for each of the six consonant triads, are shown in crotchets in the appended staff, the primaries being indicated by minims:

Each interval gives rise to its own combination tone, but, in the cases of the fundamental position and second inversion of the C major triad, two combination tones happen to coincide. The reader will at once observe that in the major group no note extraneous to the harmony is brought in by the combination tones. In the minor group this is no longer the case. The fundamental position and the first inversion of the triad are both in an A \flat , which is foreign to the harmony, and the second inversion involves an additional extraneous note, B \flat . The position of these adventitious sounds is not such as to produce dissonance, for which they are too far from each other and from the notes of the triad; but they cloud the transparency of the harmony, and so give rise to the effects characteristic of the minor mode. The unsatisfying character of minor compared with major triads comes out with peculiar distinctness on the melodeon; as indeed, from the powerful combination tones of that instrument, we should naturally have anticipated.—Sedley Taylor, from whose work "On Sound and Music" nearly all of the above passage on inversion is taken, says: "The musical notation in ordinary use evidently takes for granted a scale consisting of a limited number of fixed sounds. Moreover, it indicates directly absolute pitch, and only indirectly relative pitch. In order to ascertain the interval between any two notes on the staff, we must go through a little calculation, involving the clef, the key signature, and perhaps, in addition, 'accidental' sharps or flats. Now these complications, if necessary for pianoforte music, are perfectly gratuitous in the case of vocal music. The voice wants only to be told on what note to begin, and what intervals to sing afterward; *i. e.*, it is concerned with absolute pitch only at its start, and needs to be troubled with it no further. Hence, to place the ordinary notation before a child who is to be taught to sing, is like presenting him with a manual for learning to dance, compiled on the theory that human feet can only move in twelve different ways. Not only does the established notation encumber the vocalist with information which he does not want; it fails to communicate the one special piece of information which he does want. It is essential to really good music that every note heard should stand in a definite relationship to its tonic or key note. Now there is nothing in the established notation to mark clearly and directly what the relation ought in such case to be. Unless the vocalist, besides his own part, is provided with that of the accompaniment, and possesses some knowledge of harmony, he cannot ascertain how the notes set down for him are related to the key note and to each other. The extreme inconvenience of this must have become painfully evident

to any one who has frequently sung concerted music from a single part. A bass, we will suppose, after leaving off on F \sharp , is directed to rest thirteen bars, and then come in *fortissimo* on his high E \flat . It is impossible for him to keep the absolute pitch of F \sharp in his head during this long interval, which is perhaps occupied by the other voices in modulating into some remote key; and his part vouchsafes no indication in what relation the E \flat stands to the notes or chords immediately preceding it. There remains then nothing for him to do but to sing at a venture some note at the top of his voice, in the hope that it may prove to be E \flat , though with considerable dread, in the opposite event, of committing a conspicuous *fortissimo* blunder. The essential requisite for a system of musical notation, therefore, is that, whenever it specifies any sound, it shall indicate in a direct and simple manner the relation in which that sound stands to its tonic for the time being. A method by which this criterion is very completely satisfied shall now be briefly described. The old Italian singing masters denoted the seven notes of the major scale, reckoned from the key note upward, by the syllables *do, re, mi, fa, sol, la, si*. As long as a melody moves only in the major mode, without modulation, it clearly admits of being written down, as far as relations of pitch only are concerned, by the use of these syllables. The opening phrase of 'Rule Britannia,' for instance, would stand thus: *do, do, do, re, mi, fa, sol, do, re, re, mi, fa, mi*. In order to abridge the notation, we may indicate each syllable by its initial consonant. The ambiguity which would thus arise between *sol* and *si* is got rid of by altering the latter syllable into *ti*. In order to distinguish a note from those of the same name in the adjacent octaves above and below it, an accent is added, either above or below the corresponding initial. Thus *d'* is an octave above *d*; *d_i* an octave below *d*. When a modulation (*i. e.*, a change of tonic) occurs, it is shown in the following manner: A note necessarily stands in a twofold relation to the outgoing and incoming tonic. The interval it forms with the new tonic is different from that which it formed with the old one. Each of these intervals can be denoted by a suitable syllable initial, and the displacement of one of these initials by the other represents in the aptest manner the supersession of the old by the new tonic. The old initial is written above and to the left of the new one. Thus *rf* indicates that the note *re* is to be sung, but its name changed to *fa*. As this is a somewhat difficult point, a few modulations are appended, expressed both in the established notation and in that now under consideration. The instances selected are from C to G, from C to F, from E to C, from G to F \sharp .

Immediately after a modulation, the ordinary syllable initials come into use again, and continue to be employed until a fresh modulation occurs. It will be seen at once that the difficulty of 'remote keys,' which is so serious in

the established notation, thus altogether disappears. For instance, a vocal phrase occurring in Spohr's 'Last Judgment,' which in the established notation is represented in the following manner:

takes, in the notation before us, the simple form,
s l t | d' m f s | s f l l l s | f m.

As another example, take the following, from the same work:

The system of notation of which a cursory sketch has just been given originated, it is said, with two Norwich ladies named Glover, but has received its present form at the hands of Mr. J. Curwen, to whom it owes the name of 'tonic sol-fa,' by which it is now so widely known. No mention has been made of the notation for minor and chromatic intervals, nor of that for denoting the relations of time by measures appealing directly to the eye, instead of by mere symbols. On these and all other points connected with his system, Mr. Curwen's published works on tonic sol-fa give full and thoroughly lucid and intelligible explanations. Mr. Curwen has also created a very extensive literature of the best vocal music, printed in his own notation, which has given a most remarkable impulse to choral singing." Helmholtz gives his opinion in favor of the tonic sol-fa method.—Melody is a sequence of sounds of different heights and durations, producing an agreeable effect. In the development of music, melody preceded harmony; and Helmholtz traces the progress of musical theory through three distinct periods, viz.: 1, homophonous music of antiquity, to which belongs the music at present in use among oriental people; 2, polyphonic music of the middle ages, which allows of several parts, but without attaching any importance to the individual signification of musical accords; its period extends from the 10th to the 17th century, when it developed into: 3, harmonic or modern music, characterized by the importance given to harmony considered in itself. This school of music began to develop in the 16th century. The best theory of melody, like that of harmony, is based on the existence of the harmonics in all musical sounds. The harmonics which exist in any two sounds determine the affinity of their sequence, just as the affinities existing between the notes of any chord depend

on the harmonics which are common to them. It is necessary for the existence of a melody that the sounds composing it shall have definite intervals between them, or, in other words, steps in pitch, and that these sounds shall have definite durations. The measure of the music directs us in the division of time, while the sequence of the notes by definite numbers of tones and semitones gives us the means of making the steps in pitch; and thus we have the movement of the music from the rhythm and the melody. Such sounds as that made by the wind produce confused and unmusical impressions because of the absence of measure and of gradations in pitch; but music has a scale for measuring the ascending and descending movements of sounds, and this scale is the gamut. The foregoing considerations will lead to a rational explanation why, in the musical scale, we have the octave, the fifth, the third, and so on. In the following table are given the tonic, and under it various musical intervals. Each interval is followed by those of its harmonics which it has in common with the tonic. The greater the number of such ties, the greater the affinity of the notes.

Tonic (1)	1	2	3	4	5	6	7	8	9
Octave (2)	—	2	—	4	—	6	—	8	—
Twelfth (3)	—	—	3	—	—	6	—	—	9
Fifth ($\frac{3}{2}$)	—	—	3	—	—	6	—	—	9
Fourth ($\frac{4}{3}$)	—	—	—	4	—	—	—	8	—
Major third ($\frac{4}{3}$)	—	—	—	—	5	—	—	—	—
Minor third ($\frac{5}{4}$)	—	—	—	—	—	6	—	—	—

The octave has all of its even harmonics in common with the tonic; therefore the affinity between it and the tonic is greater than that between the notes forming any other interval. Hence, the octave is to a great extent the repetition of the tonic, and this is of course true of all the notes of any octave, referred to the

same notes in the octave below. Thus we have a rational explanation of the fact that each succeeding octave repeats the impression made by the one which preceded it. The fundamental tone of the twelfth is really the third harmonic of the tonic, and its second and third harmonics coincide with the sixth and ninth harmonics of the tonic; but the affinity between the tonic and its twelfth is evidently far less than that existing between the tonic and its octave. In diminishing degrees of affinity follow the fifth, fourth, major third, and minor third. The nearest affinities dominated in the earlier periods of music. Thus, in the polyphonic chanting of the middle ages the fifths were most in vogue, while the thirds and sixths are typical of modern music, and are characteristic of the early developments of harmony. According to Helmholtz, there is an affinity of the first degree between two sounds when they have at least one harmonic in common; an affinity of the second degree when the two sounds have a harmonic in common with a third sound. From these premises he deduces the construction of the diatonic scale with notes which have for the tonic affinities of the first and second degrees. The immediate affinities of the tonic C are composed of the notes C₂, G, F, A, E, and E_b, if we confine ourselves to the first six harmonics, the others being too feeble to determine an affinity. We thus have the gamuts: C _ _ E _ F _ G _ A _ _ C₂; or better, C _ _ E_b _ F _ G _ A _ _ C₂, for we cannot place in the same gamut notes so near to each other as E and E_b. In this series there are two intervals which are too large, and in order to divide them we must recur to the affinities of G, which are C, D, E_b, B, C₂. The D and the B are thus found to be related to C by an affinity of the second degree; on interpolating them in the above gamuts, we obtain the diatonic gamut C, D, E, F, G, A, B, C₂; which becomes the minor ascending gamut if we place E_b in the place of E. The D which we find in the affinity of F differs by a comma from D as determined by G. These examples will serve to show the method followed by Helmholtz. "In studying the rules of harmony we finally perceive that the accords, considered as complex sounds, contain the same relations of affinity as the notes of the gamut, by reason of the coincidence of some of their notes. The important function of the tonic in modern music, or what M. Fétis calls the principle of tonality, is also explained by the properties of the harmonics of the tonic. These principles, so clear and so simple, have afforded Helmholtz the means of deducing from considerations in some respects mathematical the fundamental rules of musical composition. Nevertheless, we cannot but be of the opinion that the last word on the theory of music has not been said, for all of the deductions of Helmholtz are not beyond criticism. Thus, Arthur von Oettingen has criticised with much reason the explanation which Helmholtz gives of the difference be-

tween the major and minor modes, for the phenomenon of the harmonics is sometimes barely perceptible. Von Oettingen finds that difference in the reciprocal principles of tonicity and of phonicity. The tonicity of an interval or of an accord consists in the possibility of considering it as a group of harmonics of the same fundamental sound. It is thus that the major accord is formed by the fourth, fifth, and sixth harmonics of the tonic or fundamental. 1. Phonicity is the inverse property of having a harmonic in common; the minor accord $\frac{1}{3}$, $\frac{1}{4}$, $\frac{1}{6}$ has the sound 1 as common harmonic or phonic. The major accord has the phonic 60; the minor accord has for tonic $\frac{1}{60}$. These relations can be expressed as follows:

$\frac{1}{60}$	$\frac{1}{3} - \frac{1}{4} - \frac{1}{6}$	1	4 - 5 - 6	60
Tonic.	Accord (minor).	Phonic.	Tonic.	Accord (major).
F	A - C - E	E	C	C - E - G
				B

Musicians call C the tonic and G the dominant of the gamut of C major, which can be written thus:

C	D	E	F	G	A	B	C
1	$\frac{3}{2}$	$\frac{5}{4}$	$\frac{4}{3}$	$\frac{3}{2}$	$\frac{5}{3}$	$\frac{15}{8}$	2

Von Oettingen calls E the phonic and A the dominant of A minor, and writes the above gamut as follows:

E	F	G	A	B	C	D	E
$\frac{1}{2}$	$\frac{15}{16}$	$\frac{3}{8}$	$\frac{2}{3}$	$\frac{3}{4}$	$\frac{4}{5}$	$\frac{8}{9}$	1

By the development of this dualism he obtains the parallel construction of the major and minor modes." (Radan, *Acoustique*).—Whenever music is written for parts, the laws of harmony necessarily come into play, and the skill of the composer is required, not only to have the harmonics correct, but that the parts shall be distinct and clear. This polyphonic style requires very intricate laws, and hence persons capable of creating lovely melodies, and writing them in combination with other themes, are as rare as great poets. In harmonious treatment of music, the following are a few of the radical laws. In the regular progression of harmonics the fundamental bass note falls a fifth to whatever note, or rises a fourth to the octave above it; but this law has many exceptions. If in the treble or soprano part the procession of notes is upward, say C D E G, the bass cannot give the same notes, but must use others, such iterations being intolerable to the musical ear. Accordingly, it is a rule in harmony or part writing that contrary motion is best between the extreme parts; or that when one goes upward the others go downward, and the reverse. The parallel motion, as it is called, is in use between extreme parts, but then the notes must be different. Thirds or sixths move harmoniously together. When the parts are in octaves, the law against identical notes moving up or down together

ceases, for the effect of such unity supersedes harmony for the moment. There are certain keys which have a close alliance to others. Given a certain key or tonic, for example, on which it is proposed to write a piece, say C: the keys having the closest alliance to this are G major, the fourth below; A minor, the third below; F major, the fourth above; and E minor, the third above. Next in order of alliance to C are E major, E flat major, A major, and A flat major. The key of B major is widely dissociated from C; so too B flat major; and F sharp major is a distant musical shore only to be approached in a long musical voyage. D minor and D major in their relations to C can be used but transiently. D flat major can be reached readily through C minor. The passing to a new key without an intermediate chord is called a transition; when one or more chords are used, it is called a modulation. Transitions are among the brilliant effects of modern dramatic music. A great surprise, sudden and violent emotion, warrants a transition, and the change may be further enforced by an explosion of all the orchestral instruments. The transition is marked in proportion as the notes of the scale are changed. A transition from C to G for the purpose named would be timid and feeble; but one from C to A flat or D flat would be effective. In the one case all the notes of the chord of G are found in the scale of C; in the others, two notes are changed; hence the shock.—We close this portion of the article with a few observations on the relations existing between the physical theory of consonance and dissonance and the æsthetics of music. Helmholtz founds his theory of consonance and dissonance on the fact that whenever a dissonance is perceived beats are produced by the constituent sounds of the chord, and that in consonance these beats are few or entirely wanting. On this physical basis the intervals are placed in the following order, according to their degree of freedom from dissonance. The octave stands first, then follow the fifth, the fourth, the major third, the major sixth, the minor third, the minor sixth. This classification, as stated, is based on the decreasing number of beating harmonics in the successive intervals; but it does not necessarily follow that the smoothest

chords will always be those which are musically the most pleasing; for may there not be some other property which gives us greater satisfaction than mere consonance? "Æsthetic considerations come in here, with the same right to be heard as mechanical considerations within their own domain. Now unquestionably the ear's order of merit is not the same as the mechanical order. It places thirds and sixths first, then the fourth and fifth, and the octave last of all. The constant appearance of thirds and sixths in two-part music, compared with the infrequent employment of the remaining concords, leaves no doubt on this point. In fact these intervals have a peculiar richness and permanent charm about them, not possessed by the fourth or fifth to anything like the same extent, and by the octave not at all. The thin effect of the octave undoubtedly depends on the fact that every harmonic of the higher of two musical sounds forming that interval, coincides exactly with a harmonic of the lower sound. Thus no new sound is introduced by the higher note; the quality of that previously heard is merely modified by the alteration of relative intensity among the constituent harmonics. Major and minor thirds bring in a greater variety of pitch in the resultant mass of sound than does the fifth; but this can hardly be said of the major and minor sixths compared with the fourth. On the whole, we are inclined to attribute the predilection of the ear for thirds and sixths, over the other concords, to circumstances connected with its perception of key relations, though we are not able to give a satisfactory account of them. The ear enjoys, in alternation with consonant chords, dissonances of so harsh a description as to be barely endurable when sustained by themselves. This constitutes a marked distinction between it and the other organs of sense. As instances of the kind of discords in which the ear can find delight, take the following. The chord marked * should in each case be played first by itself, and then in the place assigned to it by the composer. The effect of this isolated discord is so intensely harsh that it is at first difficult to understand how any preceding and succeeding concords can make it at all tolerable; yet the sequence, in both phases cited, is beautiful.

Considerations such as those just alleged tend to show that, while physical science is absolutely authoritative in all that relates to

the constitution of musical sounds, and the smoothness of their combinations, the composer's direct perception of what is musi-

cally beautiful must mainly direct him in the employment of his materials."—Besides the authorities previously mentioned, see Fétis, *Traité du contrepoint et de la fugue* (Paris, 1825); Reicha, *Traité de haute composition musicale*, edited by Czerny (4 vols., Vienna, 1834); Cherubini, *Cours de contrepoint et de fugue* (Paris, 1835; translated into English by C. Clarke); Dehn, *Lehre vom Contrapunkt*, &c. (Berlin, 1841); Marx, *Die Lehre von der musikalischen Composition* (4 vols., Leipsic, 1852); Richter, *Lehrbuch der Harmonie* (Leipsic, 6th ed., 1866; translated into English by John P. Morgan, New York, 1867); Ouseley, "Treatise on Harmony" (Oxford, 1868); "Treatise on Counterpoint, Canon, and Fugue" (1869); and Weber, *Allgemeine Musiklehre* (Darmstadt, 1872).—HISTORY OF MUSIC. The history of music is older than that of civilization. The most savage races are found to have some rude musical instruments, sufficient at least to mark certain rhythmical divisions of time and to serve as accompaniment to the dance; those less savage have melodies; while in all recorded instances where nations have advanced from barbarism to civilization music has followed the national growth. Among the oldest nations of whose history we have any knowledge it has been cultivated from time immemorial. The Hindoo, Chinese, and Japanese music is probably what it was thousands of years ago. The Chinese, whose music practically is unpleasant to refined ears, have some sweet-toned instruments, and a notation for the melodies played on them which is sufficiently clear. Their history and fables touching the art antedate by many centuries those of classic nations; in the time of the emperor Hoangti, some centuries before the Christian era, they had discovered that the octave was divisible into 12 semitones. The relations which the Egyptians assigned between the sounds of music and the planets, the signs of the zodiac and the 24 hours, are all found among the Chinese. The two Chinese instruments, the *kin* and the *che*, contain all the elements of whatever scales. Calculations among the Chinese on all combinations of sounds have been carried to a great extent. Kouie, a Chinese musician who lived 1,000 years before the assumed era of Orpheus, said: "When I play upon my *king* the animals range themselves spell-bound before me with melody." Confucius said 100 years before Plato: "Wouldst thou know if a people be well governed, if its manners be good or bad, examine the music it practises." In their system and practice the Chinese detail eight kinds of sound under which all can be classed: metal, stone, silk, bamboo, gourd, earthenware, skins, and wood. This division, according to them, is to be found in nature. The different substances are made into instruments. They are, besides the gong and the bamboo pipes, the *kin*, a body of thin wood curved like the top of a violin to increase resonance, with five strings of silk of different sizes; the *che*, an instrument kindred

to the *kin*, but having the chromatic or scale of half tones; the *king*, a frame of wood with pendent stone, graduated through 16 notes, and struck with a hammer; drums; a species of flutes, which anciently had but three finger holes; brass instruments of the trumpet species; guitars resembling the mandolin; and little boards with a pleasant sound. The Chinese make use of music in their most dignified ceremonies. The sacred imperial hymn, sung with great pomp annually, is a sequence of long-drawn notes, precisely parallel to the early church music in unison, and lacking the interval of the fourth and seventh, like the old crude popular scales of some European nations. The secular melodies of the Chinese are founded upon sequences of notes, such as are found in playing on the black keys of the pianoforte. They eschew all harmony on principle. Music makes no progress among the Chinese, as their sumptuary laws would restrain its development if there were genius to advance it. The head of the musicians in China is called conservator of the five capital virtues: humanity, justice, politeness, wisdom, and rectitude. Their music affects a certain seriousness, rejecting the sensuous element. The Persians rank vocally among them as the Italians do among us, and it has been said that singers from that country make concert tours in China.—The higher style of oriental music, which has a limited degree of melodious merit, with rhythms logically and distinctly drawn from consociation with poetry as refined and liquid as the Italian, may be found in that of India, dating also from the remotest antiquity. The poetic legends of Hindostan, and indeed of all southern Asia, rival those of China and Greece in ascribing fabulous effects to music. The Hindoos consider every art as a direct revelation from heaven; and while their inferior deities communicated other parts, it was Brahma himself who presented music to mortals. To his son Nared is imputed the invention of the *vin*, a stringed instrument with a finger or key board for frets, being of the same family as the modern guitar. The Hindoo writers on music (and there are works exhibiting earnest study of its mathematical bases) theoretically recognize divisions of the scale corresponding to our octave in 22 fractional tones, these fractions being quarters or thirds, or approximate equivalents. As to the fractions, they admit practically that they have no existence, since only tones or semitones are known in their actual compositions. The succession of tones and semitones in their scale is that of the diatonic. The seven notes of this scale they term *swarras* or sounds, the first or key note being distinguished from all others by this generic word, and the six others by different names. But their words being polysyllabic, the ancient Hindoo artists took their first syllables only to designate respectively the notes of the scale. The syllables thus chosen are quite as good as the Italian *do*, *re*, *mi*, *fa*, *sol*, *la*, *si*, *do*, and are as follows:

sa, ri, ga, ma, pa, dha, ni. These are the notes of the major diatonic scale. The minor mode is also familiar to East Indian music. The finger board of the *vina* is about two feet long, with frets like the guitar, which permit the player to divide the scale into half tones over 14 notes. The Hindoo writers have names corresponding to ours for the tonic or first, the mediant or third, and dominant or fifth of the scale; and indeed there are multitudinous proofs of their assiduous study of the art, however limited their practical skill, owing to the paucity and imperfection of their instruments. They have music in common and triple time, that is, in groups of two and three notes severally.—The Hebrew music, both vocal and instrumental, is constantly referred to in the Bible, and especially in the Psalms, and yet we have no certain knowledge as to its character. It was probably founded on the music of the Egyptians, and it is conjectured that one of the results of the Egyptian training which Moses received was the introduction into the Hebrew service of the music of the Egyptian priesthood. But no melodies that have come down to us can be identified as those used in the temple service. That the singers were a body by themselves under leaders, and that the singing was done by alternate choirs, as was later the case with the primitive Christians, is well known. That they had various instruments, both wind and stringed, is also known. So also had the Egyptians; but as none of the ancient nations possessed a knowledge of harmony, the music they produced must have been to a degree harsh and dissonant. The discovery by Bruce of a painting of a harp upon a Theban tomb furnished the first evidence as to the ancient state of music on the Nile, and of the fact that long before Athens was founded the Egyptians were possessed of stringed instruments. It is further proved from the monuments that the Egyptians had an instrument with frets like the guitar; none of the hundreds of representations of instruments of Grecian music indicate that the Greeks had arrived at that point of ingenuity. What the Egyptian composition of music was can only be inferred, for no relics of it exist, unless the inartificial songs of the boatmen on the Nile be taken as samples of the art of a polished people.—Greek music was probably little more than sonorous declamation, sustained by the lyre, and some pleasant notes from the flute and pandean pipes, with the martial trumpet on occasion. In the Greek drama the language was sung, not spoken. It was a musical recitative, and the chorus intoned. The theatres were very large, without roofs, and were capable of holding many thousands. To enable the performers to be heard well, it was necessary so to intone the voice; and moreover they wore metallic masks to add to the resonance. This was as artificial a mode of representing passion and emotion as the modern opera, though its means were fewer. It is

generally conceded that the Greeks did not understand harmony, and that their lyre of a few strings merely played the notes of the voice. The discovery of some Greek musical manuscripts (that is, poetry with musical signs) on the revival of letters gave rise to great displays of erudition and much passionate argument. Fanaticism in favor of Greek music culminated, but all to no purpose; for no satisfactory key to the Greek system was found. Although a treatise on ancient music by Euclid is extant, and other writers of antiquity who have come down to us discuss it, they shed little light on the ancient musical manuscripts. We know that the Greeks had many hundreds of musical signs; that to be a musician-poet required years of practice; but with the interpretations of the two or three extant Greek musical manuscripts, we can only discover, if the interpretations be right, that they had some sort of minor mode, and declaimed in a kind of recitative, and intoned pretty much as is done in the Roman Catholic service by the priest. The Greek lyre was too poor an instrument to afford much melody, though the ancient flute might have had some advantages; and as there was a theocratic resistance to improvements in instruments, and the maintenance of music in prescribed forms was considered a state necessity, we may fairly infer that the science of music was not understood by the Greeks. Nevertheless their interest in it was great. Musical tournaments were held, and choruses and dances were used to aid the religious ceremonies. Pythagoras and Aristoxenes wrote upon the art, and Boëthius has expounded their theories in five books *De Musica*. With the Romans the art never made any progress, and their music seems to have been an echo of the Greek, without force or originality.—In tracing the history of the art as it exists in our own day, we need go no further back than to the beginning of the Christian era; for although modern music may be said to have a certain relation to that of the ancients, the connection between the two is so slight that it may be disregarded. We look therefore to the early music of the Christian church, to whose fostering influence through several centuries the preservation and progress of the art was due, for the foundation upon which the modern system is built. The exact nature of the psalms used by the early Christians is not known, but they were sung antiphonally, and probably were borrowed partly from Hebrew and partly from pagan sources. The first high ecclesiastic who is known to have greatly interested himself in the music of the church was St. Ambrose, to whom are attributed many of the early hymns and the selection of the four so-called Ambrosian keys or scales in which he advised that the music for the church should be written. The next eminent priest to set his mark upon the music of his time and to further the advancement of the art was Pope Gregory I. (590–604). He

established new ecclesiastical keys, founded and encouraged a system of musical training at Rome, wrote many hymns, and finally was the father of the Gregorian chant, upon the broad foundation of which the music of the church rested for several centuries. But as yet harmony, the most important element of music, did not exist. In chanting, the performers all sang the melody. The system of musical notation was also exceedingly imperfect, certain signs called *numæ* being used to designate the pitch and duration of notes, the lines and spaces of the staff not yet being invented. It was not until the discovery of harmony, and

the invention of the staff and of a proper nomenclature for the notes of the scale, that the art of music began to free itself from its fetters. During the 7th, 8th, and 9th centuries there is little to be recorded in the way of musical progress. At the close of the 9th century Hucbald, a Flemish monk, wrote a treatise on harmony, which had already begun to be practised after a rude fashion, the octave, fourth, and fifth only being used, and the parts progressing together. The following example, harsh enough to modern ears, will serve better than any description to show the condition of the science of harmony in those days:

Nos qui vi-vi-mus be-ne-di-ci-mus Do-mi-num ex hoc nunc et us-que in sæ-cu-lum.

The notation is modern, for it was not till more than a century later that Guido Aretino, also a monk, added two lines to the staff, then consisting of two only, and originated the system of solmization on which his reputation rests. At the same time that progress was made in harmony within the church, the love of music, innate in human nature, found expression through the songs of the people. There is scarcely any nation whose traditions do not furnish examples of folk songs of a remote antiquity. The Celts made great progress in this direction; their bards were famous for their skill in poetry and song. They also possessed an instrument known as the *crouth*, which had several strings of different pitch; and many writers on music have asserted their belief that the secrets of harmony were known to them before they were to the Italians. The French also had their *chansons*, the Italians their *canzonetti*, and the Germans their *Volkstlieder*. Nothing was more common than for the church composers to adopt some well known popular air as a theme for their masses. Indeed, the masses were not infrequently named after the song which served as their basis, so that we find the mass "Farewell, my loves," that of "The Armed Man," that of "The Pale-faced Man," that of "The Red Noses," and many others similarly named. The minstrels, jongleurs, minnesingers, and troubadours played a very important part in the development of the music of the middle ages. From the close of the 11th to the commencement of the 14th century these musicians exercised a wide influence. Minstrelsy and warlike deeds were closely associated; many of the knights were also minstrels. Among those nobles who were distinguished troubadours were Thibaut, king of Navarre, the chevalier Raoul de Coucy, and William IX., count of Poitou. Pierre Vidal of Toulouse accompanied Richard of England as minstrel on the third crusade. The troubadours cultivated various kinds of lyric compositions, such as the *chanson* or love song, the

sirvente or satire, the *tenson* or lyric contest, the *balada* or ballad, and the *serena* or serenade. On their return from the crusades they brought home various new musical forms caught in the East, which served to enlarge the domain of melody. In the beginning of the 14th century the troubadours as a class disappeared; but in that century music received a fresh impetus from the Netherlanders, who suddenly took the lead of all European nations in the cultivation of the art, which supremacy they held for a century and a half, sending their musicians as teachers, leaders, and composers into all countries. The Netherlands at this time were rich and prosperous; their cities were in a condition almost of republican freedom; the government under the house of Burgundy was liberal, and fostered with especial care the arts of painting and music. Counterpoint received great attention during the period of the Dutch supremacy, and in the course of the 15th century the Netherlanders became the most learned contrapuntists in Europe. The first of their composers who came into notice was Guillaume Dufay, born in Hainaut, in the latter part of the 14th century. His masses, which are to be found in manuscript in the papal chapel, are the oldest known in contrapuntal form. Dufay is credited with having emancipated music from the harsh succession of fourths, fifths, octaves, and unisons, which constituted the harmony of preceding composers. The next Flemish composer of eminence was Jan Okeghem, who exerted great influence not only as a composer, but also as a teacher. Among his pupils was Josquin des Prés (died about 1530), the most famous composer of his day. He did not strive, as did many of his time, to construct impossible fugues and ingenious contrapuntal puzzles, written simply to display his technical knowledge, but sought to infuse intelligence and soul into all the parts, and to give sympathy and expression to music. His influence was felt in Italy, where for a time he was attached to the pontifical choir of Sixtus

IV., and in France, where he was composer and chief singer in the chapel of Louis XII. Among his celebrated pupils were Jannequin, Arcadelt and Willaert. With the last named of these composers (died about 1563) the ascendancy of the Dutch in musical composition began to decline. The application of movable metal types to the printing of notes in 1502 served to cheapen and diffuse published music. Willaert's greatest distinction rests on the fact that he was the first celebrated composer who gave his attention to the composition of madrigals, from which fact he was called "the father of the madrigal." While still a young man he went to Venice, and he became the head of the Venetian school. During the 16th century, and contemporary with Willaert, lived many notable composers: in Italy, Palestrina, Constanzo Festa, Luca Marenzio (one of the greatest of madrigalists, surnamed the Sweet Swan), and Cypriano de Rore, called by the Italians il Divino; in the Netherlands, Orlando di Lasso, Clemens non Papa, and Christian and Sebastian Hollander; in Spain, Cristofano Morales; in England, Marbeck, Tallis, Bird, Morley, Weelkes, and Wilbye. Nearly all of these distinguished themselves as composers of madrigals; the English cultivated this form of composition with so much success that the practice of madrigals became during that century the delight of refined society; sight reading was at that time even more than in our own day a common accomplishment among the educated. The madrigals of Wilbye, Weelkes, and Morley have never been surpassed in beauty of melody and form, or in the freedom with which the different parts move. In 1601 Thomas Morley published a collection of madrigals in fulsome praise of Queen Elizabeth, entitled "The Triumphs of Oriana," to which 20 English composers contributed. Of the composers of other nations whom we have named, the two most famous were Palestrina and Orlando di Lasso. The latter was the last of the great Netherlands school, and after his death the ascendancy passed over to the Italians. As to Palestrina, it is difficult to overestimate the talent of the man or his influence over the art in his day. In his compositions the solemn words of the mass found their highest and noblest musical expression. He was truly regarded as the great reformer of church music. So fully was his genius recognized by the composers of his own time, that 14 of the most celebrated combined to compose and dedicate to him a collection of psalms in five parts. He used only the ecclesiastical modes, and avoided all straining after effect by strange harmonies; but his knowledge of counterpoint, and the elevation and nobility of his style, made his masses and his other compositions, of which he wrote a vast number, examples for all time of what true church music should be. During this century the keyed instruments in use were the organ, the virginal, the spinet, the clavichord,

and the harpsichord. The viol, the guitar, and the flute were also used. Between 1550 and 1600 instruments were first introduced into churches for the purpose of accompanying voices. No such thing as independent accompaniment was known at this time, the instruments being used only to reënforce the voice and playing from the vocal score. The violin now began to assume new importance, and in the hands of the Amati family and their immediate successors it was brought with wonderful rapidity to a beauty of form and color and sweetness of tone that have not since been excelled. It is the only example in history of an instrument which at once attained its perfection, and which the inventors of two centuries and a half have not been able to improve upon. (See AMATI.)—The closing year of the 16th century witnessed the birth both of opera and of oratorio. In the year 1600 was performed at Florence a work entitled *Euridice, una tragedia per musica*. The words were by Rinuccini, the music by Peri. This work possessed after a rude fashion the characteristics of the modern opera. In the same year was performed at Rome Emilio del Cavaliere's religious drama *L'Anima è corpo*, which may be considered the forerunner of the oratorio, as Peri's work was of the opera. The way had been long preparing for both opera and oratorio, through the miracle plays and the performances representing the passion of Christ. These sacred musical dramas were often performed in a hall, called by the Italians *oratorio*, adjoining the church, and hence came to be called by that name. Cavaliere's work was first represented on the stage of the church of La Vallicella, with appropriate scenery and action. The personages were Time, Pleasure, the Body, the World, and Human Life. There was also a chorus that commented, after the manner of the Greek tragedies, upon the events narrated. The instruments of accompaniment were placed behind the scenes, and were as follows: *una lira doppia*, a double lyre; *un clavicembalo*, a harpsichord; *un chitarone*, a large guitar; *due flauti*, two flutes. Instead of overture, a madrigal with all the voice parts doubled was recommended by the composer. The example thus set by Cavaliere was speedily followed by other composers. Among the most distinguished of those who contributed to this form of composition during the 17th century were Carissimi, Stradella, Scarlatti, and Caldara. Another element combined with that of the miracle plays to give form to the opera; this was Greek tragedy. With the revival of letters a new impetus had been given, especially in Italy, to the study of the Greek authors. At the house of Giovanni Bardi, count of Vernico, in Florence, a small musical and literary circle was accustomed to meet to discuss the probable forms of Greek music, and the method in which they could be made available. Vincenzo Galilei, father of the astronomer, was one of this number. From theory they advanced to practice,

and Galilei was the first to write music for a single voice. Among the members of this circle were the poet Rinuccini and the musician Peri. Their efforts to reproduce the musical declamation of the Greeks resulted finally in the musical setting to Rinuccini's *Euridice*, in which appeared what they called the *stilo rappresentativo*, which in a somewhat altered form we now know as recitative. The opera of *Euridice* was called by its authors a *drama per musica*, the term opera not being applied to this kind of composition till 1656. The scenery represented first green fields, then the ocean, afterward the abodes of the blest, and finally the torments of the infernal regions. The language was bombastic, and the music awkward and affected. The solos were in the style of recitative, and the choruses in madrigal form. The instruments were the same as those mentioned above in the oratorio. The next Italian operatic composer of eminence was Claudio Monteverde. His *Orfeo*, composed in 1607, was an advance upon Peri's music. The orchestration was better, the recitative more dramatic, and suggestions appeared of the aria, which was yet to be invented. The opera quickly spread over Italy, and finally crossed the Alps, Cardinal Mazarin introducing it in 1645 into France. The first opera there performed was *La finta pazza*, which was given in the presence of Louis XIV. The first French opera was called *Akebar roi de Mogol*; the words and music were by the abbé Mailly, and it was performed in 1646. The first French operatic composer of any note was Cambert, who however was speedily supplanted in the favor of the king by the Italian Lulli. This composer for many years controlled the French lyric stage, more by his sense of dramatic situations than by the merit of his musical forms. He was the first to elaborate and give prominence to the overture. The first of his operas performed in France was *Les fêtes de l'Amour et de Bacchus*, which was represented in 1672. The principal Italian composers during the last half of the 17th century were Cesti, Alessandro Scarlatti, and Carissimi. The last did not write for the stage. Henry Purcell (1658-'95) was at this time one of the few native composers on whom the English could look with pride. He had been a close student, almost an imitator, of the style of Carissimi, and did much, both through his operas and church compositions, for the elevation of his art.—The 18th century was the age of great orchestral writers, operatic and oratorio composers, and performers. It would be impossible to name all of the illustrious musicians of that century; among those of most conspicuous talent were (in the order of their birth) Marcello, Domenico Scarlatti, Rameau, Handel, Bach, Porpora, Hasse, Martini, Pergolesi, Jomelli, Gluck, Piccini, Haydn, Grétry, Paisiello, Clementi, Cimarosa, Mozart, Cherubini, Méhul, Beethoven, and Spontini. Auber, Schubert, Rossini, Meyerbeer, Donizetti, and others, though born in the

18th century, belong rather to the 19th, in which their genius began to manifest itself. We can only refer with any detail to such of those whom we have named as exercised a marked and lasting influence upon the art. First among them was Johann Sebastian Bach. Though he was only cantor at St. Thomas's church in Leipsic, and undertook no works that were not in the simple line of his duty, he has given to the world organ and vocal compositions unrivalled in their way. The art of fugue writing, so steadfastly cultivated during the so-called Dutch period, he perfected. Taking the German chorals for his themes, he wrought upon them his great work, the passion music, the sublimest ever composed for the Protestant church. Though Bach produced also delightful compositions for the stringed orchestra, such as his suite in D, his fame must rest upon his passion music and his organ and pianoforte works. While Bach was elevating the church music of Protestantism, his great contemporary Handel was working out that mighty chain of oratorios that have since been the delight of the world. For many years he had devoted himself to the composition of Italian operas; more than 40 of these exist, but never will be placed upon the stage again. From them, however, have been selected many arias, such as the *Lascia ch'io pianga* from the opera of *Rinaldo*, that are still among the greatest favorites of the concert room. It was fortunate for the world that Handel failed in his operatic enterprises, otherwise such works as "Saul," "Samson," "Judas Maccabæus," "Israel in Egypt," and the "Messiah" would never have existed. In the century and a quarter that has elapsed since they were created, no greater works of their kind have been produced. From Haydn composition for the orchestra received its greatest development. This illustrious composer when a boy had the benefit of instruction from Porpora, the great Italian composer, from whom he derived his knowledge of vocal writing; and he learned the art of setting words to music from Metastasio the poet. But with all these advantages he failed as an operatic composer, while he succeeded in orchestral music and oratorios. His genius for melody was so great that, although he was nearly contemporary with Handel, his melodies are in advance of Handel's in grace, symmetry, and essential beauty. His muse was kindred with Mozart's. In symphonic writing, in many respects, he has not been excelled; in breadth and depth, however, the palm for that department has been awarded to his successor Beethoven. The form of the symphony, as developed by Haydn, is derived from that of the piano sonata or violin quartet; generally it is composed of four movements: an allegro, usually the principal movement; then a slow movement; then a minuet, or old dance tune; then a rondo, or finale, of quick movement. There is no organic completeness in this design, so far as the number of movements is

concerned; they are all distinct, and there might as well be one movement, or 40, if so many could be compassed; but symphonies and quartets were composed according to this method as though under an irrefragable law. Their structure is: a theme or melody in a given key, say C major; a passage leading to another key, G major, the most closely related to the first, with a strong assertion of the chord of the seventh or the fifth of G, which is D, before the second theme or melody is taken; then follows some accessory and climacteric matter, and we arrive at the end of the exposition of the primary ideas. The second part is taken up, generally after the first is repeated, but without stopping; and now begins what is called the development of ideas, in which the primary ones are set off in various ways, by new harmonies or accessories of melody, by double counterpoints (that is to say, placing phrases indifferently as the bass or treble), by modulations, by instrumentation, &c.; and this runs into a repetition of the original melody, to which the second melody is added, but this time in the same key with the original, and the whole is crowned with a musical peroration in which appear the most ambitious flights and climaxes. The second movement of the symphony is a clear melody, with accessory and developed matter, and the melody repeated with a short peroration. The third is a minuet, measured and somewhat developed. In Beethoven's symphonies the minuet is set aside for the *scherzo*, or playful movement, in which piquancy is aimed at. The last movement of the symphony is a melody or theme with accessories, its repetition, and a peroration. Sometimes the last movement is the most important. In the choral symphony of Beethoven the voices are added. The quartets and sonatas of Haydn, as well as those of later composers, are on the same plan as symphonies, but generally briefer, as the variety of instrumental coloring in an orchestra warrants greater length. In the course of 50 years Haydn produced more than 500 instrumental compositions. A remarkable trait of the composer was his unerring sense of orchestral color, and of the precise instrument or combination of instruments that best produced the effects he had in mind. While Haydn was developing the instrumentation of his time, Gluck was working with equal zeal and success in the domain of opera. He was a great reformer, and was the first to announce in clear and unmistakable language the true principles upon which opera should be composed. Much that he then said has since been reiterated by Richard Wagner. Even now the world is slow to accept the theories then advanced; what wonder then that Gluck in his day excited the liveliest antagonism, and that a contention arose between his adherents and those of Piccini (the Gluckists and the Piccinists) which enlisted on one side or the other all the literary and fashionable people of Paris? In the preface to an

edition of three of his operas (Paris, 1769) Gluck expounded his theories of operatic composition, the pith of which is that the legitimate purpose of music is to second poetry in order to strengthen the expression of the sentiments and the interest of the drama, without interrupting the action or weakening it by superfluous embellishments. (See GLUCK, vol. viii., p. 43.) These maxims the composer exemplified by his works. The subjects were mostly from Greek classical literature, as the names of his principal operas indicate, such as "Orpheus," "Alceste," "Iphigenia in Aulis," "Paris and Helen," and "Iphigenia in Tauris." In spite of the fierce opposition of the Piccinifaction, France gave its adherence with enthusiasm to Gluck and his works, and from that day the false and artificial methods of the earlier composers were laid aside, and a new era began for the opera. The dramatic and poetic element found its true position by the side of melody and harmony. The next great composer to exert a wide influence upon operatic and other forms of composition was Mozart. He was a man of universal musical genius, and was distinguished as a writer of chamber music and symphonies and as an operatic composer. His pianoforte compositions were also numerous; but his influence was not marked in that direction, since he adhered to the forms given him by his predecessors, without effecting in them any great change or improvement. To this generation he is best known through his operas. He was a thorough master of the Italian art of singing, and brought to the support of the voice and the enriching of his scores his profound knowledge of treatment. What Gluck had begun in the way of sweeping aside the formalism and artificiality of the earlier Italian operatic composers, Mozart completed. Their works together gave a new direction to art, which has had its effect on all subsequent composers for the lyric stage. While the "Orpheus," "Alceste," and "Iphigenia" of Gluck, and the *Don Giovanni*, "Marriage of Figaro," and "Magic Flute" of Mozart still keep the stage, the works of their contemporaries have mostly passed into oblivion. Cimarosa's *Matrimonio segreto* is still occasionally heard, but we look in vain in the modern operatic *répertoire* for the works of Paisiello, Salieri, Sarti, Paer, Zingarelli, Hasse, or Righini, all prominent composers in Mozart's time. But the 18th century was distinguished also by many illustrious performers. The more extended knowledge of harmony and the constantly increasing technical ability of instrumental players pushed on the musical instrument makers to improvements and new inventions. The violins, violas, violoncellos, and double basses, as we have seen, had already attained their perfection at the hands of the Amati, Stradivarius, the Guarneri, Stainer, and other great makers. Yet much remained to be done for keyed instruments, and the efforts for improvement made in this direction resulted in the

substitution of hammers for the quills that were used in the harpsichord, and the instrument so constructed took the name of forte piano. The invention has been ascribed to several different men, and by some authorities it is carried back to Bartolommeo Cristofali of Padua, harpsichord player to the court of Tuscany. Improvements were made by Schröter of Bohemia, Silbermann of Strasburg, and Stein of Augsburg; but the progress was quite slow. The piano used by Gluck was made by Pohlmann in 1772, and is still in existence. It is a small square instrument, 4½ ft. long and 2 ft. wide, the wires being little more than threads, and so thin that a moderately hard blow would break them. The action is imperfect, and the hammers are a few thicknesses of leather glued over the head of a horizontal jack working on a hinge. John Broadwood and sons became the leading English makers of pianofortes in the latter part of the century, and about the same time the house of Érard was founded in Paris; and Pleyel soon after established himself also in Paris as a pianoforte maker. John Broadwood's first patent bears date July 17, 1773. Among the celebrated performers of this time were Tartini, Farinelli, and Dragonetti.—Among composers born in the last century who came to their maturity and exerted their influence mainly in the present, may be named Cherubini, Beethoven, Spontini, Boieldieu, Hummel, Bishop, Auber, Spohr, Paganini, Weber, Herold, Rossini, Moscheles, Meyerbeer, Schubert, Mercadante, Donizetti, and Halévy. Of the men born within the present century who have distinguished themselves in the art, either as composers or executants, are Bellini, Adam, Berlioz, Herz, Balfe, Mendelssohn, Chopin, Schumann, David, Ole Bull, Thomas, Liszt, Hiller, Thalberg, Wagner, Ernst, Wallace, Verdi, Franz, Bennett, Gade, Gounod, Vieuxtemps, Raff, Rubinstein, and Joachim. Among these Beethoven beyond a doubt occupies the loftiest position in the art; with him instrumental music reached its highest point of development. Whatever form of music he touched he enlarged and ennobled; under his hand the sonata was perfected and the symphony rose to its grandest proportions, culminating in the ninth, concerning which Wagner has said that with it "the last of symphonies had been written and the domain of instrumental music exhausted." His two masses and his single opera *Fidelio* are also among the noblest accomplishments of German art. A few years later than Beethoven, Spontini was born. Among the immediate successors of Mozart he holds an illustrious place. His style was noble and vigorous, his orchestral treatment admirable, and his dramatic instincts correct. In his *Vestale* and *Fernando Cortes* are many passages of true genius. Cherubini may be cited as a composer who particularly linked the styles of the close of the last century with those of this. He produced operas which are still represented, and he was equally

successful in his sublime church music. He competed with Reicha, moreover, in his profound treatises on the fugue. In brilliant fluency Rossini excels all others who have written for the Italian opera; but then it must be remembered that he was preceded by Mozart, whose operas were written to Italian words, and with melodies identical in shape, in caesural pauses, in syllabication, and in relation to the chords, with the Italian school of Paisiello, Piccini, and Cimarosa. Whatever tendency there may have been to avoid excessive ornamentation in singing, and to maintain the theory of Gluck, was set aside for many years by Rossini. Mozart, who indulged occasionally in ultra-florid music, or several notes rapidly sung to a syllable, was not brilliant in that department. Rossini was, and his ornate arabesque work not being of the old pattern, that is to say, merely roulades following a plain melody, but being integrated with the melody itself, he struck the secret of popularity, and swayed Europe musically. The voices, whether bass, tenor, contralto, or soprano, were made to do this ornate work, lavished on serious and comic scenes alike; but with all this profusion of notes, there are ever present touches of severe simplicity. This was exemplified when he wrote for the French Grand Opéra, and produced *Guillaume Tell*. Among Rossini's Italian contemporaries were Bellini and Donizetti. The romantic, tender, and impassioned strains of the former gave a new impulse to the Italian music, and established a greater popularity for it than it had hitherto enjoyed. The directness of his melodies, and his use of a few notes instead of many for masculine voices, enabled amateurs to seize hold of them who were unable to cope with the floridities of Rossini. In this new school Donizetti was the peer of Bellini, and the author of *Lucia* and *Lucrezia Borgia*, with all his shortcomings, has never been surpassed in popularity. It remains only to speak of Verdi, and all the Italian composers of any decided influence in the art will have been referred to. This composer exhibits a perfect apprehension of climax, intuitive knowledge of stage business, and strong dramatic perception. His melodies are clear, strong, and well defined. In his earlier works his merits stood in strong contrast with certain vices of style, such as overstraining the voice for effect, and noisy and empty unison passages. In his later works, such as the *Aida* and the "Requiem Mass," he has profited by the example of more painstaking composers, and produced works more carefully considered and of higher merit than his previous compositions. Many of the operas produced by composers for the French stage combine grace, brilliancy, breadth, and grandeur. Among these the works of Meyerbeer are conspicuous. The *Huguenots* contains some of the finest music ever written for the operatic stage. It has been objected to Meyerbeer that his was too much the music of effect, that he

sacrificed the higher form of art to the spectacle, that years of labor were devoted to the careful study of form, and that the soul escaped; in a word, that while his operas evinced a prodigious talent and industry, the genius was lacking. However this may be, the world has had reason to admire the splendid results of the patient labor which this composer bestowed on his operas. Among the French composers Halévy holds an honorable place. His opera *La Juive*, produced 40 years ago, has maintained its place with undiminished effect, though in his later compositions he was less successful. The most popular of recent French composers are Gounod and Ambroise Thomas. The *Faust* of the former and *Mignon* of the latter are performed wherever French or Italian opera has a foothold. In Germany the modern composers wielding the greatest influence have been Von Weber, Mendelssohn, Schumann, and Wagner. Von Weber, grasping all the extensions and improvements in orchestration, wrote overtures of a larger texture and clearer dramatic form than any predecessor, and infused into his operas qualities which placed him at the head of the new school, the romantic. His vocal writing often wants fluency, though this is less apparent in *Der Freischütz* than in *Euryanthe*; had his metres been better, his music would not have been amenable to this charge. But the transcendentalism of his music was the most daring ever attempted. In a certain class of passionate expression he was without a rival; certainly no such intense portraiture of womanly love was drawn in music before his *Agatha*. The influence of Mendelssohn was exercised partly through his orchestral works, but mainly through his two great oratorios "St. Paul" and "Elijah." Schumann manifested his strength in the vigor and novel form of his pianoforte works, and in the intensely poetic feeling, the dramatic fervor, and the variety of color of his compositions for orchestra; while Wagner has made his power felt through the earnestness with which he has put forth his ideas in his critical writings and through his great works based upon those ideas. The opposition and discussion that have been aroused by the theories broached by him are far greater even than those that were excited when Gluck propounded somewhat similar ones a century ago. But Wagner has gone much further than Gluck dared in carrying out his ideas. As briefly stated by himself, his objection to previous methods upon which operatic composition has proceeded is this: "The error of opera as a form of art has consisted in the fact that music, which is only a means of expression, has been made the end, while the drama, which is the true end of expression, has been made the means; and thus the actual lyric drama has been made to rest upon the basis of absolute music." If this theory is accepted and acted upon by future composers in the same spirit in which it is carried out by its promulgator,

it will revolutionize the art of operatic composition. Among its immediate consequences is the subordination of the composer to the poet. The drama is the thing first to be considered, the music being only a means through which the emotion excited by the dramatic situation is deepened and intensified. In the opera the aria has always been one of the principal means through which the music found expression; but the aria being a formal thing, constructed according to certain fixed rules and centring attention on itself and its own melodic beauty, this retarded the action and distracted the auditor from the thing sung about to the thing sung. Accordingly, this could find no place under the new theory, and Wagner cast it aside, putting in its place the *melos* or "endless melody," a kind of musical declamation springing naturally out of the sentiment of the words that are being sung. The orchestra also ceases to be a mere instrument of accompaniment, and is made by Wagner to enter into the dramatic situation and express it with every variety of tone and harmonic combination. The operas, or rather musical dramas as Wagner prefers to call them, written upon these theories, he avers should have a poetical basis; and he finds the proper subjects in the myths of his own country, making the *Nibelungenlied* the text of his later works. He has deemed it essential for the true exposition of his ideas that his latest operas should not be brought out in any of the German opera houses, but should have a building constructed expressly with a view to their fit and complete presentation. Such a building is now in course of erection at Baireuth, Bavaria, and there in the spring of 1876 Wagner proposes to put his theories to the final test. The four dramas composing the tetralogy, *Der Ring der Nibelungen*, will there be produced, each on a separate day. They consist of *Das Rheingold*, *Die Walküre*, *Siegfried*, and *Götterdämmerung*. Upon the success or failure of the magnificent and costly experiment there to be made, the future of the opera will in a measure depend. —A very decided influence has been exercised upon the musical art of our own day by the composers for the pianoforte. The extensions and improvements of that instrument, now carried so far as to make it the epitome of the orchestra, have been of great use to composers of every class. Through the grand piano and the organ the intricacies of the science of harmony have been explored, chords analyzed, the relations of keys made clear, and melody developed. About 1840 Thalberg began to write dramatic music for the piano, in which he gave the precise vocal pitch of the airs, and at the same time surrounded and embellished them with an arabesque of brilliant execution. There came Liszt, remarkable as a conductor and composer, but chiefly as a pianist. He carried the difficulties of pianoforte playing to their utmost limit, and placed himself by his astonishing powers at the head of modern pianists.

Chopin was a composer of the greatest sensibility. Using the rhythms and characteristic traits of the music of his native country, he treated his themes with a passionate and dramatic fervor and grace that have made him the poet of the instrument. Rubinstein, Clara Schumann, and Von Bülow are also to be ranked as virtuosos of the first order. The pianists whom we have named have seemingly thoroughly explored the capacities of the pianoforte as it at present exists, both as an instrument of expression and of execution. Every technical difficulty has been presented and every form of sentiment expressed, and in this department of the art at least there would seem to be but slight room for further progress.—See Hawkins, "A General History of the Science and Practice of Music" (5 vols. 4to, London, 1776; new ed., 2 vols. 4to, 1853); Burney's "General History of Music from the Earliest Ages to the present Period" (4 vols. 4to, London, 1776-'89); Forkel, *Allgemeine Geschichte der Musik* (2 vols., Leipsic, 1788); Hullah, "History of Modern Music" (London, 1862); Fétis, *Histoire générale de la musique depuis les temps les plus anciens jusqu'à nos jours* (4 vols., Paris, unfinished); Ritter, "History of Music, in the Form of Lectures" (2 vols., Boston, 1871-'4); and Chappell, "The History of Music" (4 vols., London, 1874 *et seq.*).

MUSICAL BOX, a case enclosing mechanism so constructed as to play tunes automatically. The principle of the mechanism is the same as that of the barrel or hand organ, and of the machinery which is used for the chimes of bells in church towers. The use of machines for making mechanical music is almost coeval with the invention of clocks; but musical boxes proper were not introduced much before the latter half of the 18th century. Among the earliest made were small ones to be worn as a charm or seal, pendent from the watch chain; and from this insignificant beginning has grown the modern musical box, capable of almost every musical effect and of playing from one to more than 100 tunes. The principal parts of the mechanism are the comb, the cylinder, and the fly or regulator. The comb is a steel board with many tongues, arranged like the teeth of a comb. The cylinder, which is usually brass, is fitted with small steel pins or points, representing the notes of the tune to be played. This is moved forward or backward by mechanism into a proper position to act on the comb, when it revolves and its pins raise and let fall the teeth, producing musical tones. As the notes must necessarily follow in rapid succession, it is impossible to make one tooth of the comb produce the requisite number without striking on the following pin; therefore, when needed, there are two, three, or four teeth of the comb of the same tone or pitch placed beside each other, which are struck by pins arranged side by side instead of behind each other, thus permitting the rapid recurrence of the same note. The time in which

the cylinder makes its revolutions depends upon the train of wheels and pinions leading to the fly. In all the larger music boxes the fly or regulator is adjustable, the wings which impinge against the air being capable of limited extension and contraction, thus retarding or accelerating the rate of revolution of the cylinder. The tones of the tongues are regulated by their length and thickness; the shorter they are, the quicker are the vibrations and the higher in the scale is the pitch. The vibrations of the long teeth are retarded by masses of lead attached to them, and underneath them are placed little dampers made of spring wire for the purpose of checking the vibrations when too long. Various attachments or accompaniments, such as bells, drums, and castanets, are often applied to musical boxes, and different effects are produced according to the arrangement of the music. In respect to these effects musical boxes are called mandolines, espressives, quatuors, organocleides, piccolos, &c. Some have a combination of reeds and pipes, and are called flutes, celestial voices, or harmoniphones. The musical clocks of the Black Forest, and the musical boxes of Prague and of Ste. Susanne in France, are largely exported. The centres of the manufacture, in its present state of mechanical perfection, are Geneva and Ste. Croix, in the Pays de Vaud, Switzerland.

MUSIMON. See SHEEP.

MUSK, a concretionary substance of peculiar and most powerful odor, which is secreted in a projecting hairy sac or bag between the umbilicus and the prepuce of the male of a small Asiatic animal, called the musk deer, and named by Linnaeus *moschus moschiferus*. The sac is from 2 to 3 in. long, and contains two or three drachms of musk, which when first removed is soft and almost liquid, but afterward hardens and dries into a substance resembling dark-colored snuff, coarsely granulated. The hunters cut off, tie up, and dry the sac, or, as it is called in commerce, the pod; and in this state the article is transported. In China, where it is chiefly supplied to commerce, the pods are packed for shipment in catty boxes holding from 20 to 25 each. A single pod being worth from \$15 to \$18, the adulteration of the article is a profitable operation; and the Chinese practise it with great skill, and to such an extent that genuine musk is scarcely known in trade. Dried blood, having the appearance of musk, is introduced into artificial sacs made of the skin of the animal, and a variety of other substances are added, with which enough musk is intermixed to give its strong odor to the mass. Musk of different qualities is also mixed together by the Chinese with the intention of passing off the whole as the best. That of Tonquin, which is obtained only from China, is far stronger than that of southern Siberia, which is also carried to China as well as to Russia. The Siberian article is received to some extent through Europe. The pods are larger and more elongated than the Chinese, and the musk is in finer

grains, and possesses a fetid odor; while the Chinese is very strongly scented, and has an odor somewhat ammoniacal. A variety exported from Calcutta, where it is brought from Thibet and the Himalaya mountains, is esteemed better than the Siberian, but inferior to the Chinese.—Musk is familiarly known as a perfume of most penetrating and lasting odor. According to the accounts of Tavernier, Charadin, and other travellers in Asia, it is so powerful when first taken from the animal that those exposed to its influence are in danger of hæmorrhage from the nostrils, even when the nose and mouth are protected by coverings of linen. Headache is often produced by approaching the sacs even in the open air. The substance was formerly in high repute as a medicine, and is still largely used by eastern nations and to some extent in civilized countries, being administered in the form of a pill or emulsion. It is used as a stimulant and antispasmodic, and has been employed in hysterical and other convulsions, hicough, and low forms of fever. Its price, the uncertainty of its composition, and a want of confidence in the efficiency of its action, render it by no means a popular drug with American practitioners. Musk is however chiefly of value as a perfume; and it is the most remarkable of substances for the diffusiveness and permanence of its odor. A whole room has been known to be perfumed with it for 30 years, and no perceptible loss of weight in the musk was occasioned thereby; and specimens known to be 100 years old were as strong as the fresh article. One part communicates its smell to more than 3,000 parts of inodorous powder. Its taste is disagreeably bitter and acrid. Its chemical composition is variable and exceedingly complicated. A volatile compound, probably of ammonia and a volatile oil, has been found by Guibert and Blondeau, in the proportion of 47 per cent. Besides this, they separated a large number of other ingredients.

MUSK DEER (*moschida*), a family of small ruminants, living in flocks on the continent of Asia and the larger islands of the Indian archipelago. They have no horns in either sex and no lachrymal sinuses, but the males have two elongated canines in the upper jaw, used as instruments of defence and offence; the legs in some are exceedingly slender; the name is derived from the presence in the males of some of the species of a bag or pouch beneath the abdomen, which secretes the powerfully odoriferous substance known as musk. The true musk deer (*moschus moschiferus*, Linn.) is of about the size of a small roebuck, with shorter legs and thicker body; the color is reddish brown, paler below and on the inside of the limbs, with throat and streak on each side of the neck white, and sometimes whitish gray on the sides; the hair is stiff, long, and curled; the canines project an inch beyond the closed mouth; the hoofs are long and sharp, well adapted for the rocky places in which they de-

light to dwell in the manner of the chamois; the ears are long and the tail short. It is shy, very active, and not easily taken; it is pursued chiefly for the odorous secretion, which is strongest and most abundant during the rutting season. This species is distributed over the

Musk Deer (*Moschus moschiferus*).

mountainous regions of central Asia, especially Thibet and China, extending even into northern Tartary. The flesh is sometimes eaten, and the skins are prepared as articles of clothing and as leather. A species is said to exist near Sierra Leone, on the west coast of Africa.—In tropical Asia and its islands are the allied genera *tragulus* (Briss.) and *meminna* (Gray), containing the most diminutive of ruminants, some of them no larger in the body than a hare. The napu musk deer (*T. javanicus*, Briss.) has shorter ears, smooth hair, very slender legs, with the supplementary hoofs at a greater distance from the ground; like the rest of the genus it has no musk sac; it is about the size of a full-grown hare, of a glossy ferruginous brown color, lighter along the back; throat, chin, under parts, and inside of the limbs white; on the fore part of the chest are three broad, white, radiating stripes, separated anteriorly by bands of blackish brown; and a white line passes back on the cheek from the lower lip. It is commonly called the mouse deer in the straits of Malacca. It inhabits Java and Sumatra, frequenting thickets near the seashore, and feeding principally on berries of a species of *ardisia*; it is easily tamed, when taken young. The kanchil (*T. pygmaeus*, Briss.) is of the size of a small rabbit, of a delicate and elegant shape, and very active; this is the species which is said to leap to the branches of a tree when pursued, hanging suspended by the canines until its enemy has passed by; the flesh is excellent. The color is reddish brown on the back, bay on the sides, white below, with three white streaks under the throat; it is common in the peninsula of Malacca and the neighboring islands, where it is captured in traps or by throwing sticks at the legs when it

comes to feed on the sweet potatoes at night; it is very cunning, feigning death when caught

Kanchil (*Tragulus pygmaeus*).

in a noose.—The Ceylon musk (*meminna Indica*, Gray) is about 17 in. high, an elegant, graceful, and gentle animal, whose flesh is excellent food; the ground color is cinereous olive, spotted, striped, and barred with white; it lives in the jungles of Ceylon and of India.

MUSKEGON, a S. W. county of the S. peninsula of Michigan, bordering on Lake Michigan, and watered by White and Muskegon rivers and other streams; area, about 500 sq. m.; pop. in 1870, 14,894. The surface consists of undulating prairie land; the soil is fertile. It is traversed by the Chicago and Michigan Lake Shore railroad. The chief productions in 1870 were 28,920 bushels of wheat, 28,629 of Indian corn, 24,028 of oats, 72,335 of potatoes, 55,872 lbs. of wool, and 5,658 tons of hay. There were 800 horses, 975 milch cows, 1,037 other cattle, 2,530 sheep, and 1,545 swine; 3 manufacturing of carriages and wagons, 3 of iron castings, 4 of machinery, 3 of sash, doors, and blinds, 5 of tin, copper, and sheet-iron ware, 1 tannery, 1 currying establishment, and 62 saw mills. Capital, Muskegon.

MUSKEGON, a city and the county seat of Muskegon co., Michigan, on Muskegon river, where it expands into a lake of the same name, near its mouth in Lake Michigan, on the Chicago and Michigan Lake Shore railroad, and at the terminus of the Michigan Lake Shore, the Muskegon and Big Rapids, and the Grand River Valley railroads, 90 m. N. W. of Lansing, and 175 m. W. N. W. of Detroit; pop. in 1870, 6,002; in 1874, 8,505. It is a stopping place for the East Shore steamboat line, and has a daily line of steamers to Chicago. The soil in the vicinity is well adapted to fruit growing, and considerable attention has lately been paid to the cultivation of peaches and grapes; but the chief business of the city is the manufacture and shipment of lumber. The logs are floated down the river to the lake, which is 5 m. long and 2 m. wide. The annual shipments amount to about 300,000,000 ft. The

trade employs more than 100 vessels, and large quantities are also shipped by rail. The principal manufacturing establishments are 32 saw mills, two flouring mills, two large steam engine works and foundries, two saw factories, a boiler factory, and five planing mills and sash and blind factories. The city contains two national banks, a union school, five ward schools, three weekly newspapers, and ten churches. Muskegon was first settled in 1836. It was laid out in 1853, incorporated as a village in 1861, and as a city in 1870.

MUSKET, the smooth-bored firearm with which the infantry of all civilized nations has been armed from the beginning of the 18th century until nearly the present time. The best authorities give the derivation of the name from the French *mouchet* or the Latin *musculus*, a male sparrow hawk. This is not so improbable a derivation as would at first sight appear, for other firearms have been named after animals, as for instance the falcon and the dragon; and the probable reason of its use will be found further on. The first portable firearm of which we have any representation is exhibited in a French translation of Quintus Curtius, written in 1468. It was called the bombard or bombardelle, and was a heavy weapon made in the shape of a blunderbuss, and fired from the shoulder, or from a wooden frame or rampart,

FIG. 1.—Bombard.

with a live coal or match. There is some evidence that these weapons were used as early as

1346 by the English at the battle of Crécy, but it is not definite. They were certainly used before the beginning of the 16th century. When gunpowder was first applied to warlike purposes, the cannon were hooped, and externally were not unlike boxes. In Germany they were therefore called *Büchse*, and an artilleryman was a *Büchsenmeister*. When guns were transported on wheels they were called *Kanonbüchse*. The portable arm which followed the bombardelle was called in German *Hakenbüchse*, because it had attached to the forward part of the stock a hook (*Haken*) which received the shock of the recoil. This name was corrupted in other languages to *arquebus*, *arquebuse*, *archibuso*, &c. The arm was also

Fig. 2.—Arquebus.

used with a forked stick upon which to rest the forward end in the act of firing, and was, if not the earliest, certainly one of the earliest portable firearms. About the same time the hammer and pan for priming were applied to the arm, and they or their equivalents have been used on portable firearms ever since. When the hammer was first used, it was merely a piece of iron bent in the shape of the letter S, and called the serpent, one end of which carried the live coal or match, and the other acted as a trigger. It was fastened to the piece at its centre, about which it could move; when the piece was to be fired the trigger end was pulled, and the match end was brought down on the priming. Springs were soon attached to it, causing it to go back to its original position after it had done its work; and this arrangement was the first gunlock. Muskets with the serpent attachment were captured from the Chinese at the Peiho forts in 1860,

Fig. 3.—Arquebus and Serpent.

and were in use in Japan until within a few years. During the 15th and 16th centuries the use of the arquebus became general in the continental nations of Europe; but the English still retained the crossbow, believing that it was more rapid and accurate in its action, and that its range was greater.—In 1517 the wheel gunlock was invented at Nuremberg, and at this time the portable arm took the name of musket. This lock consisted of a heavy iron plate to which the parts were fastened. The parts were a steel wheel about an inch and a half in diameter and a quarter of an inch thick, the circumference of which was channelled. To the arbor of the wheel was attached one end of a short iron chain, the other end of which was fastened to a heavy spring. By means of

a key, about three fourths of a turn could be given to the wheel, compressing the spring. When the wheel was turned sufficiently, a dog engaged in a corresponding hole in the wheel, fastening it. This dog could be lifted out of its hole by the action of a lever corresponding to the trigger in the modern lock, and when the dog was so lifted the wheel moved round with some rapidity. Above the wheel was fastened the pan, a piece of iron, pan-shaped, in the bottom of which was cut a hole through which a small part of the circumference of the wheel projected, filling the hole. The cock or hammer was a piece of iron or steel so arranged that one of its ends held a flint or piece of iron pyrites between jaws, and the other end was fastened to the lock plate, the hammer being free to move around the fastening. A spring acted upon the fastened end, so that when the flint end of the hammer rested upon that part of the wheel projecting through the pan, the spring pressed it hard on the wheel. To discharge the piece with this lock, suppo-

Fig. 4.—Wheel Lock with Serpent attached, front view.

Fig. 4a.—Wheel Lock with Serpent attached, rear view.

sing the priming to be in the pan, the wheel was turned until it engaged the dog; the cock was then turned so that the flint pressed on the wheel; then by pushing the trigger or lever, the wheel turned quickly, and sparks were thrown off, igniting the priming. This was an exceedingly ingenious piece of mechanism, and all flint locks made since its date are modifications of it. Many locks of the present day contain the same ideas in an improved form. The flint was held in the cock or hammer by jaws moved by a screw. In some specimens of this lock these jaws are engraved to represent the head of a bird of prey holding the flint in its beak. It is not unlikely that the name musket originated with this device. So in Germany the hammer is called *Hahn*, cock. In England and the United States cock was the name of the hammer so long as flint locks were used. In France the hammer was called *chien*, dog. As the flint in the wheel lock often missed fire, in some cases the serpent was also attached to one end of the lock plate. In this the match was kept lighted,

so that the musketeer was sure that by some means he could fire his piece. During the 16th century muskets with wheel locks were introduced into all the continental armies, but pikes were also used by foot soldiers, and the proportion of muskets to pikes was about one to three. The musket at that period bore the same relation to the infantry that the field piece does in armies of the present day. It was a good attacking weapon, but in close quarters the brunt of the action was borne by the pikemen, for the musketeers had as much as they could do to take care of their unwieldy weapons. In the 16th century the flint lock as it exists at present was also invented in Spain, and it was merely changed in details of construction, and by some subsidiary inventions, until it was in general superseded by the lock for percussion caps in this century. For a long time the flint lock was regarded with disfavor as too complicated, and likely to fail, and for nearly 100 years its use did not become general. It was adopted in France in 1630. The English were behind continental nations in portable firearms in the 16th and 17th centuries. As late as 1668 "The Compleat Body of the Art Military," by Lieut. Col. Richard Elton, which gives a system of infantry tactics and manuals for the pike and musket, recommends that two thirds of each company shall be armed with the musket and one third with the pike. The musket manual is for the arm with the match lock or serpent, and there is nothing in the book to indicate that its au-

thor had ever heard of the wheel or flint lock. The latter was introduced into England about the year 1690.—The musketeer in the days of matchlocks was a very unwieldy soldier. He

carried his musket and its rest, and a large sword. Over his left shoulder was slung a broad leather belt called a bandolier, the ends of which were fastened on the right side. On this were

FIG. 6.—Musketeer of 16th and 17th centuries, fully equipped, showing Schweinsfeder and Musket.

FIG. 5.—Chenapan or Snaphaunce Lock.

FIG. 5a.—Arab Lock of same construction.

thor had ever heard of the wheel or flint lock. The latter was introduced into England about the year 1690.—The musketeer in the days of matchlocks was a very unwieldy soldier. He

hung a number of wooden, leather, or tin cylinders, each containing a charge of powder for his musket. The balls were contained in a leather bag, and the priming powder in a flask or horn, and both were slung by separate slings from the left shoulder to the right side. He was a man of much greater consideration than is the infantry private soldier of the present day, and in some armies was allowed a servant to carry his musket on the march. At the battle of Wittewiler, in 1638, which lasted eight hours, the musketeers of the duke of Weimar fired seven times only. This account shows that the use of the musket at that time did not add greatly to the destructiveness of wars.—The *Schweinsfeder* (hog's bristle) was the immediate forerunner of the bayonet. It was a long rapier with a thin handle, and its sheath was the musket rest, which was an iron tube forked at the upper end. When the rapier was to be used, the handle was inserted in the muzzle of the musket, which then became an efficient pike. As the arm became lighter, the musket rest gradually went out of use, and in order to keep up the use of the arm as a pike as well as a firearm, some new weapon had to be devised. So in 1640 the bayonet was introduced, taking its name from Bayonne, where it was first made. At first the shank or handle was made of wood, and was inserted in the muz-

zle of the piece. Soon afterward it was made of metal in the shape of a hollow cylinder, and was secured to the piece by slipping the cylinder over the end of the barrel, and fixed

Fig. 7.—First Bayonets. 1. Bayonet of 1640, triangular blade, fastening in bore of musket. 2. Spanish Bayonet, fastening in bore. 3. French Bayonet, fastened by ring and spring.

in place by a stud soldered to the barrel. This arrangement permitted the piece to be fired with the bayonet fixed. The introduction of the bayonet gradually caused the pike to be thrown aside as an infantry weapon, and correspondingly increased the importance of the musket. About this time sights were placed on muskets, and their accuracy of fire was consequently much increased. The flint lock was improved, and the barrel and stock were fastened to each other in a more mechanical manner. Cartridge boxes were introduced, and during the second half of the 17th century the musket was so materially improved that it may be considered as having become the main arm of the infantry from the commencement of the 18th century. The ramrod of the musket, made of wood, was clumsy and easily broken until about 1720-'30, when the iron ramrod was introduced into the Prussian army by Frederick William I., father of Frederick the Great; and the consequent improvement in the rapidity of fire of the musket was enormous. At the battle of Mollwitz, in 1741, between the Austrians and Prussians, the Austrians used wooden and the Prussians iron ramrods. The defeat of the Austrians was at the time imputed

Fig. 8.—1. Old Prussian Musket and Bayonet, with wooden ramrod. 2 and 3. French Musket and Bayonet, model of 1777-1800.

to the superior rapidity of fire of the Prussian muskets, due entirely to the use of iron ramrods. During the remainder of the 18th century the musket gradually, by changes in form,

took on the continent of Europe nearly the shape and appearance that it retained until the superseding of the muzzle-loader by the breech-loader. Bands were substituted for the projections on the barrel which fastened it to the stock, the ramrod was lightened, the leather strap for carrying the arm on the march was added, and the weapon was made simpler and more convenient, so that the soldier was sooner instructed. France led in these improvements. Great Britain seems to have retained an earlier model, and bands were not there applied to muskets until the present century. In the early part of the 19th century, on account of the wars of the French republic and empire, the number of muskets manufactured was enormous. In the two years 1809-'10 Birmingham furnished 575,000 musket barrels and 470,000 gun locks. In 1813 England made 500,000 muskets, and from 1814 to 1816 she furnished for her allies and herself 3,000,000. From 1803 to 1814 there were made in France about 4,000,000 muskets.—In 1818 the percussion cap was invented, and its use gradually superseded

Fig. 9.—1. Percussion Musket Lock. 2. Military Percussion Cap.

that of the flint and steel, so that by 1850 nearly all the armies of the civilized world were armed with muskets using the percussion locks. The advantages of these locks are: 1, the lock is simplified; 2, the operation of firing is shortened; 3, the sureness of fire is increased, the presence of water having no effect upon the explosion of a good percussion cap. The explosive substance in military percussion caps is fulminate of mercury. This salt is mixed with powdered glass, and a small portion of the mixture is placed in the bottom of a copper cup. The fulminate is covered with tin foil, and then with lacquer, so that it is impervious to water. With the percussion lock a "nipple" or cone was fastened to the barrel of the musket at the right side of the breech instead of the pan of the flint lock, and a hole through the cone communicated with the rear of the bore. The percussion cap was placed on the cone, which it fitted closely; the hammer struck the cap, exploded the fulminate, and communicated fire to the gunpowder in the barrel.—The calibres of muskets were until about 1850 .7 in., a little more or less. The

old British musket "Brown Bess" had a bore .75 of an inch in diameter. The length of the barrel was 42 in., the weight of the ball 1.06 oz., and the weight of the musket 12.25 lbs. The whole length, including bayonet, was 59 in. About 1853 in Great Britain the Enfield rifle was adopted, the bore of which was .577 in. Until this time British muskets were made without bands, the barrel being fastened to the stock by pins. The Enfield rifle had bands. The weights of all muskets in use in the last century were from 10½ to 12½ lbs.—In the

FIG. 10.—English Musket, "Brown Bess."

United States the first muskets used were of course of English manufacture. The Indian and French wars had caused the distribution of large numbers of these arms among the colonies, and the war of the revolution was commenced with them. But after the alliance with France was perfected, French muskets were obtained, and it is likely that by the end of the war, in 1783, the troops were generally armed with French arms. The United States began to manufacture muskets at Springfield, Mass., in 1795, after the French model, and this model with slight variations was used until the adoption of the Springfield rifle, model of 1855. New models were introduced in 1799, 1822, and 1840, all of French style, and of the French calibre, .69 in., and carrying a ball weighing a little less than an ounce.

FIG. 11.—Musket and Bayonet, Model of 1841.

In fact it may be said that until the introduction of the needle gun in Prussia, France gave the model for the musket to all civilized nations. About 1842 percussion-lock muskets were adopted, and when the Mexican war began in 1846 there were enough to have armed the troops; but Gen. Scott preferred the flint-lock musket, considering it dangerous to campaign in an enemy's country with so untried a weapon as the percussion musket. After that war its use became general in the army. In 1855 the Springfield rifle was adopted, and it gradually displaced the old musket, until at the commencement of the civil war in 1861 the troops of the regular army were armed with that weapon. Nearly all the infantry arms at that time in store were muskets of .69 in. calibre. The whole number of muskets and rifles manufactured at the Springfield armory from 1795 to 1865, when the manufacture of muzzle-loading arms was stopped, was 1,517,464, and

the expenditure during the same period was \$25,199,626 30. Over \$2,000,000 reckoned as expenditure was the value of the property of the United States in lands, buildings, &c., belonging to the armory, and about \$3,000,000 was the value of the parts of arms unassembled when the manufacture was stopped. The number made at the other United States armory, that at Harper's Ferry, Va., cannot be given. At the commencement of the civil war this armory was dismantled, and all the records and movable property were carried to Richmond by the confederates. Its capacity for turning out arms was then about equal to that of the Springfield armory.—There are other names of muskets besides those given previously. The hand cannon was a tube on a straight piece of wood about 3 ft. long. It had trunnions, cascable, and vent on top like a cannon. Afterward the vent was placed at the side and the priming was held in a pan. Its date was nearly the same as that of the bombardelle. The hand gun was longer in barrel than the hand cannon. It had a cover for the pan, and some arrangement for taking sight. The English seem to have used it in 1446. The snap-haunce was a modification of the wheel lock. Instead of the wheel a straight piece of furrowed steel was used. The flint pressed against it, and when the steel was suddenly moved by the spring, fire was struck. It was introduced into England in Queen Elizabeth's time, but did not get into general use until the time of the civil wars. The name is derived from the Dutch. The caliver, lighter and shorter than the musket, had a match lock. The carbine was simply a horseman's musket, and was shorter

and lighter than the infantry musket. The origin of the word is obscure. It was introduced into England from France, but the term came from Spain, and from Calabria, where it

was first used. It has been surmised that the Calabrians used it on board of small vessels called carabs. The term fusil applied to a musket appears to have been taken from the French, and was brought into England when locks using flints were introduced. It is technically the steel against which the flint is struck in a tinder box or gun lock. The term fusiliers for part of the infantry is still retained in some armies, particularly the British, and was originally the name given to troops using the flint-lock musket, to distinguish them from those who used the match-lock or wheel-lock muskets. The mousquetoon was of French origin, and shorter and not so efficient as the musket. The petronel was a short musket for horsemen's use. The name comes from *pedernal*, flint, and not, as is generally supposed, from *poitrine*, as it was supported against the breast when it was fired. The blunderbuss was a short piece with a large bore and funnel-shaped

muzzle. It was loaded with slugs, nails, &c. The word is of German origin, and the arm was introduced into England from Holland. In German *Donnerbüchse* would be the term, which after corruption by the Dutch becomes blunderbuss in English. The *escopette* is the Spanish or Mexican name (*escopeta*) for a carbine. The oldest document that mentions portable firearms is an inventory at Bologna dated 1397, in which they are called *scolpos*. From this term were derived later *sclopeti*, *esclopette*, *escopette*. (See RIFLE.)

MUSKINGUM, a river of Ohio, formed by the junction of the Walhonding and Tuscarawas, which rise in the N. part of the state and unite at Coshocton, whence it flows S. E. for about 110 m. through Muskingum, Morgan, and Washington counties, and enters the Ohio river at Marietta, its mouth being 225 yards wide. At Zanesville and other points abundant water power is afforded by falls. It is navigable for steamboats to Dresden, 95 m. from its mouth.

MUSKINGUM, a S. E. county of Ohio, intersected by the Muskingum river, which affords abundant water power, and drained by Licking river and other branches; area, 665 sq. m.; pop. in 1870, 44,886. It has a diversified surface and fertile soil, and contains bituminous coal, iron ore, and salt, the last procured by deep boring into the whitish sandstone, or salt rock. Large quantities of salt and coal are exported. It is intersected by the Ohio canal and the Central Ohio division of the Baltimore and Ohio railroad. The Muskingum Valley railroad terminates at Zanesville, and the Pittsburgh, Cincinnati, and St. Louis passes through the N. W. corner; there is also a branch from Dresden to Zanesville. The chief productions in 1870 were 336,984 bushels of wheat, 1,198,677 of Indian corn, 313,240 of oats, 185,130 of potatoes, 605,194 lbs. of wool, 815,562 of butter, and 38,094 tons of hay. There were 9,430 horses, 9,379 milch cows, 15,480 other cattle, 145,954 sheep, and 21,690 swine; 5 manufactories of agricultural implements, 8 of brick, 19 of carriages and wagons, 1 of railroad cars, 3 of woollen and 1 of cotton goods, 4 of furniture, 3 of glass ware, 2 of iron, 7 of castings, 11 of saddlery and harness, 8 of salt, 31 of stone and earthen ware, 18 tanneries, 5 breweries, 13 flour mills, 5 saw mills, and 2 lime kilns. Capital, Zanesville.

MUSKOKEES. See CREEKS.

MUSKOKA, an electoral district of Ontario, Canada, in the W. part of the province, bounded W. by Georgian bay; area, 5,307 sq. m.; pop. in 1871, 6,919, of whom 2,541 were of English, 2,092 of Irish, and 1,293 of Scotch origin or descent. It is bounded S. by the Severn river, and watered by Muskoka river, by the outlet of Lake Nipissing, and by other streams and lakes. Capital, Bracebridge.

MUSK OX (*Ovibos moschatus*, De Blainv.), a ruminating animal found in the arctic regions of America, seeming to form, as its generic name imports, the connecting link between

the ox and the sheep. It is about the size of a two-year-old cow, 5½ ft. from nose to root of tail, and weighs about 700 lbs., two or three times as much as the reindeer; the head is large, and surmounted by broad flat horns in both sexes; in the males the horns

Musk Ox (*Ovibos moschatus*).

meet on the median line of the head, from which they bend down on the cheeks, and then turn outward and upward, much as in the gnu; dull white and rough on the basal half, they are smooth and shining beyond, and black at the point; the horns of an old male measured by Dr. Kane were 2½ ft. from tip to tip, and each 1½ ft. to the median line of the head. The nose is very obtuse, with only the small space between the nostrils naked; the ears not perceptible, tail concealed by the hair, the legs short, and the hoofs broad and inflexed at the tips. The hair is so long that it almost reaches the ground, so that the animal looks more like a large sheep or goat than an ox; the color is brownish black, more or less grizzled. The musk ox frequents arctic America from lat. 60° to 79° N., and from lon. 67° 30' W. to the Pacific coast; though Dr. Kane saw no living specimens, the skeletons and probably footmarks were so numerous that he was inclined to believe the statement of the Esquimaux that these animals had been recent visitors, and probably migrated from America to Greenland; they are generally seen in herds of 20 or 30, in rocky barren lands, and feed on grass and lichens; the rutting season is about the end of August, and the young are born toward the first of June. Though the legs are short, they run very fast, and climb hills and rocks with great facility; they are difficult to approach; the males are irascible, and often dangerous when slightly wounded; the flesh, when fat, is well tasted, but when lean smells strongly of musk, as does the whole animal, whence its name; the hair is long and fine, and, if it could be obtained in sufficient quantity, would be useful in the arts; the skin is made into articles of dress by the Esquimaux. The tracks made by this animal in the snow are much like those of the reindeer, somewhat larger, and

can be distinguished only by the skilful hunter. Only one living species is known, and the geographical distribution of this is not precisely ascertained. It is very rare in collections, the only specimen in the United States being in the museum of the Philadelphia academy of natural sciences, a stuffed skin presented by Dr. Kane. It is said to occur fossil at Eschscholtz bay on the N. W. coast. The *bos Palasii* (De Kay) of North America and the fossil oxen found in various parts of the United States, coming near the musk ox, have been described by Dr. Leidy, under the name of *bootherium*, in vol. v. of the "Smithsonian Contributions to Knowledge" (1853), as the *B. cavifrons* and *B. bombifrons*; these probably, he says, were clothed in a long fleece, and inhabited the great valley of the Mississippi just anterior to the drift period. The Siberian and northern European fossils probably belong to the genus *ovibos*.

MUSKRAT (*Fiber zibethicus*, Cuv.), an American rodent, the only species of its genus, well known for its aquatic habits; it is also called musquash, musk beaver, and ondatra. The dentition is: incisors $\frac{2}{2}$, and molars $\frac{3}{3}$ - $\frac{3}{3}$, in all 16 teeth. The body is rat-like, the head and neck short; the eyes and ears very small, the latter having no special arrangement except their dense fur to exclude the water; the upper lip not cleft, and hairy between the teeth and nose; lips thick and fleshy; nose thick and obtuse; six horizontal rows of whiskers, with some over the eye and under the chin; the legs short, and the thighs hid in the body; the claws compressed and incurved, the third toe the longest on the fore feet and the fourth on the hind feet; the hind feet appear slightly twisted, the inner edge posterior to the outer, by which the animal can "feather the oar" when the foot is brought forward in swimming; all the feet are partly webbed, naked below, covered with short hairs above, and

Muskrat (*Fiber zibethicus*).

have their edges more or less margined with bristly fringes; the tail is two thirds as long as the body, compressed, two-edged at the end, scaly, with short thin hair; the fore feet are four-toed, with a wart-like thumb, and the hind feet five-toed. The head and body are

from 13 to 15 in. long, and the tail 9 or 10 in.; the general color is ruddy brown above, darker on the back, and cinereous beneath; some specimens are very dark brown; the long hair is fine, compact, and silky, with coarser hairs intermingled, especially above. It is more extensively distributed over North America than the beaver, and unlike the latter does not disappear at the approach of civilization; it is found from the Atlantic to the Pacific, and from the Rio Grande to arctic America, even on the N. W. coast; it occurs nowhere in the old world. Fortunately for the rice planter, it is not found in the alluvial lands of the Carolinas, Georgia, Alabama, and Florida, though it extends much further south. Its favorite locality is a grassy marsh or bank of a lake or sluggish stream; nocturnal in habit, it is occasionally seen in the daytime swimming a stream or diving into the mouth of its hole; awkward on land, it is an excellent swimmer and diver, and very lively and playful in the water; it often swims 15 or 20 yards under water. The burrows are made in banks skirting streams, the entrances being under water, thence leading upward above the highest freshets; their winter galleries often extend 40 or 50 ft. from the water, the central part containing the nests, made of dried reeds and grasses; in swamps and marshy lands they sometimes raise mounds of sticks, twigs, and leaves from 2 to 4 ft. above the surface, in which are their grassy beds large enough to accommodate several animals; the entrance to these is also under water, the surface of which they take care shall not be entirely frozen. The fur was once in great demand for hats, and hundreds of thousands of skins were annually exported for this purpose to Europe; their value is now very small, as they are used chiefly for cheap furs; the animal, however, is generally killed when possible, to prevent the destruction of dams and embankments. They are not at all cunning, and may be caught in ordinary box traps, or in steel traps placed just under water and baited with sweet apples or parsnips; they are often dug out of their holes, hunted by dogs, and speared in their nests. Great numbers are killed by lynxes, foxes, owls, and other rapacious mammals and birds. Like the common rat, they are omnivorous, feeding on grasses, roots, vegetables, mussels and other mollusks, fruits, and even flesh; they are injurious rather from digging under embankments and undermining meadows than from destroying vegetation either in field or garden. They are very prolific, bringing forth four to six young at a time, three times a year. They have a strong musky odor, which to most persons is less offensive than that of the mink, and far less so than that of the skunk; the flesh is considered palatable in some localities.

MUSK TURTLE. See TORTOISE.

MUSONIOUS, *Calus Rufus*, a Roman stoic of the 1st century A. D. Nero banished him to Gyarus in 66, under pretence of his having been

a party to the conspiracy of Piso. On the death of Nero he returned from exile, and when Antonius Primus, the general of Vespasian, was advancing against Rome, he joined the embassy sent by Vitellius to make terms with his enemies. After the downfall of Vitellius he became reconciled to Vespasian, who suffered him to remain in Rome. The only edition of the extant fragments of his works is that of Peerlkamp (Haarlem, 1822).

MUSPRATT, James Sheridan, a British chemist, born in Dublin, March 8, 1821, died in Liverpool in November, 1871. He removed at an early age to Liverpool, where his father established a large chemical manufactory. At the age of 13 he travelled through France and Germany, and subsequently studied in the laboratory of Prof. Graham of Glasgow, whom he accompanied to London. Before reaching the age of 17 he was sufficiently advanced to be intrusted with the chemical department in a large manufacturing establishment in Manchester, and he also published a lecture on chloride of lime. After an attempt to embark in business in America, by which he lost money, he went in 1843 to Giessen and studied chemistry for two years under Liebig. His first important original paper was one on the sulphites, published in Liebig and Wöhler's *Annalen*, in which he proved the analogy between the sulphites and the carbonates, and which procured him the degree of doctor of philosophy. While at Giessen he edited Plattner's "Treatise on the Blowpipe," with many valuable additions. Between 1845 and 1847 he travelled over Europe, returning in the latter year to Giessen, where he discovered several remarkable bodies produced from the sulphy-cyanides of ethyle and methyle. In 1848 he returned to England, married the American actress Susan Cushman, and soon after founded a college of chemistry in Liverpool, of which he was appointed director. In 1854 he commenced a dictionary of chemistry, published in Europe and America in parts, which was completed in 1860 in 2 vols. royal 8vo. It was translated into German and French, and reached a large circulation. He has also published "Outlines of Quantitative Analysis for Students."

MUSQUASH. See MUSKEAT.

MUSCHENBROEK, Pieter van, a Dutch mathematician, born in Leyden, March 14, 1692, died there, Sept. 19, 1761. He was educated at Leyden, and in 1717 formed an intimacy with 'sGravesande, who subsequently coöperated with him in introducing the Newtonian system of philosophy into Holland. In 1718 he took his degree of doctor of medicine, and soon afterward visited England for the purpose of seeing Newton and making himself acquainted with his system. In 1719 he was appointed professor of philosophy and mathematics and professor extraordinary of medicine in the university of Duisburg, which he resigned in 1723 for the chair of philosophy and mathematics at Utrecht. Here he re-

mained till 1739, and about 1740 he accepted the chair of mathematics at Leyden, which he filled during the remainder of his life. His works contain many original researches in experimental physics, and are among the earliest expositions of the Newtonian philosophy; the cohesion of bodies, the phosphorescent properties which many bodies acquire from exposure to light, magnetism, capillary attraction, and the size of the earth being among the subjects most successfully treated.

MUSSEL, or **MUSCLE** (Lat. *musculus*; Ger. *Muschel*), a well known lamellibranchiate mollusk of the genus *mytilus* (Linn.). It belongs to the dimyarian group, or those having two adductor muscles, the anterior being small; the mantle has a distinct anal orifice; the foot is small, cylindrical, grooved, with many retractile muscles and a large silky byssus divided to its base; the shell is longitudinal and subtriangular, with the beaks terminal and pointed, dark-colored and shining. The common salt-water mussel (*M. edulis*, Linn.) is from 1 to 2½ in. long and 1 in. broad, of a greenish black

Common Salt-water Mussel (*Mytilus edulis*).

color externally and purplish and bluish white within. This species is esteemed as food in Europe; they lie together in large beds uncovered at low water, and are more easily obtained than the oyster; they are most esteemed in autumn, as in the spring or spawning season they are apt to disarrange delicate stomachs and to produce a cutaneous eruption; thousands of bushels are annually obtained for food and bait for deep-sea fisheries, affording employment for hundreds of women and children, especially along the frith of Forth; they anchor themselves very firmly to rocks and stones by the horny threads of the byssus, directed by means of the foot, and attached by their broad disk-shaped extremities. The common mussel of New England (*M. borealis*, Lam.), by some considered the same as the last species, is eaten, fresh and pickled, in some parts of the country, but is more commonly used for bait or manure. The forms of their shells are very various, from accidental distortions or from the shape of the cavities and crevices in which they are commonly wedged. Several other species are described.—Another shell, commonly called mussel by the fishermen, is the allied genus *modiola* (Lam.), known in Europe as the horse mussel. Our common species (*M. modiolus*, Turton) is from 4½ to 6 in. long and from 2½ to 3 in. wide; the shell is

thick, coarse, and rough, with the beaks subterminal; the color externally is chestnut or dark brown, pearly within. It inhabits deep water, attaching itself very firmly to rocks, from which it is torn in great numbers during violent storms; it is almost always more or less distorted, and has seaweed or some parasite attached to it; though too tough for food, it makes excellent bait for cod and other deep-sea fishes, but is very difficult to obtain when wanted. Other species live in brackish water; some in Europe are said to burrow and make a nest of sand and fragments of shells.—The fresh-water mussel (*anodon*) and river mussel (*unio*) are dimyarian, with a large foot not byssiferous in the adult; the hinge is toothed. The *A. fluviatilis* (Gould) has a thin, inequilateral shell, grassy green externally and lilac-tinted white within, and attains a length of 4½ in.; it is common in mill ponds and sluggish streams. Many other species of this genus, and of *unio* and allied genera in North America, have been specially described by Mr. Isaac Lea. Some of the unios, both in this country and in Europe, produce very fine pearls, and about 20 years ago there was a general pearl hunting in many parts of the United States, which resulted in the finding of a few valuable specimens after an immense amount of generally unprofitable labor. The pearl mussel of Europe (*U. margaritifera*, Linn.) has long been famous for the ornamental excretions found in its shell, some of which are of rare beauty.

MUSSET, Louis Charles Alfred de, popularly known as Alfred de Musset, a French poet, born in Paris, Nov. 11, 1810, died there, May 2, 1857. He was a son of VICTOR DONATIEN DE MUSSET (1768–1832), better known under the name of Musset-Pathay, a cousin of the marquis Musset de Cogners, and, like the latter, of literary distinction, especially for his writings about Rousseau. Alfred is said to have written a tragedy as early as 1826, and in 1828 he received a prize for a Latin dissertation. He alternated for some time between the studies of medicine, law, and art, and was for a short period attached to a banking house, but was encouraged in his predilection for literature by intercourse with Charles Nodier and Victor Hugo. His first work, *Les contes d'Espagne et d'Italie* (1830), revealed his poetic talent, and excited much attention and comment on account of the unbridled utterances of a fantastic and erotic imagination. His next important production, *Le spectacle dans un fauteuil* (1833), consisted of a tragical poem (*La coupe et les lèvres*), a graceful comedy or *imbroglia* (*A quoi rêvent les jeunes filles?*), and a kind of Byronic narrative in verse (*Namouna*), containing eloquent lines addressed to the Tyrolese, which were regarded by his admirers as the most classical production of the romantic school. More perhaps than any of his contemporaries he embodied in his effusions morbid and skeptical views of life, which mar to some extent the beauty of his exquisite poem

Rolla (1835), and of his *Confession d'un enfant du siècle* (1836; new ed., 1859). In the latter work he describes under fictitious names his journey to Italy with George Sand, and his relations with that authoress, which led her to publish in 1859 *Elle et lui*, and to the appearance in the same year of *Lui et elle* by Alfred's brother, PAUL EDMÉ DE MUSSET (born in Paris, Nov. 7, 1804, and known as the author of *Les femmes de la régence*, 2 vols., 1841, and other works), and to George Sand's refutation of the latter's allegation against her, in the preface to her novel *Jean de la Roche*, also in 1859. Alfred became in 1836 as devoted to Mme. Malibran as he had previously been to Mme. Dudevant. His *Poésies nouvelles* (latest ed., 1862) contain his *Strophes à la Malibran*, and his *Nuit de mai, de décembre, d'octobre et d'août*; these *Nuits* are regarded as the most beautiful of his lyrics, and as most deeply reflecting the conflicting emotions of his inner life. Among other fine effusions are his *Lettre à Lamartine* and *L'Espoir en Dieu*. During the political complications in 1840 he answered Becker's German war song in regard to the Rhine with a poem entitled *Nous l'avons eu, votre Rhin allemand*. The influence of the duke of Orleans, who had been his college classmate, had procured for him the office of librarian in the ministry of the interior; and he commemorated the death of that prince in 1842 in one of his most eloquent poems. He was deprived of his office at the revolution of 1848, but was restored to it after the establishment of the empire (1852), with the title of reader to the empress. His finest poetry was written before his 30th year, which made Heine say: *C'est un jeune homme d'un beau passé*. His *Contes* comprise *Mimi Perizon*, *Histoire d'un merle blanc*, and *La mouche* (1854). Among his best novelettes are *Emmeline* and *Margot*. He was less successful as a dramatist, though his *Un caprice* (3d ed., Paris, 1848), *Il ne faut jurer de rien* (1848), and *Il faut qu'une porte soit ouverte ou fermée* (1851), were received with great favor. A complete edition of his *Comédies et proverbes*, revised by himself, was published in 2 vols. in 1856. His complete works, with illustrations, and a biographical notice by his brother, appeared in 10 vols. in 1865-'6. His *Œuvres posthumes* (1867), include *Faustine*, an unfinished drama, *L'Âne et le ruisseau*, a graceful comedy, and poems and letters, one of the latter containing a picturesque account of Rachel's reading *Phèdre* to him in her house.

MUSSEY, Reuben Dimond, an American surgeon, born in New Hampshire in 1780, died in Boston, June 28, 1866. He practised his profession during the earlier part of his life with great success in his native state, and from 1814 to 1838 was connected with various medical professorships in Dartmouth college. He afterward removed to Cincinnati, where he was professor of surgery in the Cincinnati college of medicine and surgery from 1838 to 1852,

when he took the same chair in the Miami medical college, resigning in 1860 and removing to Boston. His surgical practice in Cincinnati and the neighboring country was large, and he was widely known and resorted to as a consulting surgeon. He was a prominent temperance lecturer, and advocated temperance in eating as well as drinking. He published "Health, its Friends and its Foes" (12mo. Boston, 1862).

MUSTARD, the name of a well known condiment as well as of the plants which produce it. In commerce two sorts of mustard seed are known, the white and the black, which are produced by plants formerly called *sinapis alba* and *S. nigra*; but in the most recent revision of the *cruciferae*, the family to which they belong, *sinapis* is reduced to *brassica*, the genus which includes the cabbage and the turnip, and according to this view the mustard plants are *brassica alba* and *B. nigra*. White mustard

Mustard.

is an annual, with a stem 1 to 2 ft. high, smooth or with a few spreading hairs; its leaves are pinnately lobed, more or less rough, the lobes coarsely toothed, with the terminal one the largest; the yellow flowers in a raceme, succeeded by pods three fourths of an inch to an inch long, bristly, upon spreading stalks and terminated by a stout flattened beak which forms more than one half of the pod and is one-seeded, while the lower part of the pod is turgid and contains several seeds; the seeds are pale brown or brownish yellow. Black mustard is a somewhat taller and smoother plant, and has less divided leaves; the pods are erect, smooth, about half an inch long, and somewhat four-sided, without the long beak, but tipped with the style, with much smaller and very dark brown seeds. Both species are natives of Europe, and are found in the older portions of this country as naturalized weeds. The seeds of both are sold by druggists; a portion of the supply is of home growth, the rest being

imported. White mustard is much used in England as a salad; the seeds are sown very thickly, and the young plants are cut while still in the seed leaf; cress (*lepidium sativum*) is usually sown with the mustard, and the product of the two together is known as "small salading." This species is sometimes cultivated in gardens as a pot herb or greens, the leaves being cooked while yet tender. In England mustard is much sown as a crop for forage and for green manuring, and the few experiments that have been made with it here have been favorable; sowed at the rate of about 12 lbs. to the acre, it gives an abundant crop of succulent forage, which is cut before the seeds begin to mature and fed to cattle, sheep, and swine. When either kind is raised for seed, it is cut with a sickle before it begins to drop its seed, and when dry threshed with a flail. The great consumption of mustard seed is in the preparation of the "flour of mustard" for table use; the black seeds are the most pungent, but both kinds are used together; the seeds are crushed between rollers, then pounded in mortars, and the finer portions sifted from the husks. This was first prepared in Durham, England, by a woman who kept her process a secret, and the name "Durham mustard" is used as a trade mark by manufacturers at the present day. There is probably no article of domestic consumption more generally adulterated than flour of mustard; wheat flour to increase the weight, turmeric to give color, and cayenne to add pungency, are the most common adulterations; sometimes gypsum or white clay is used with chrome yellow (chromate of lead) to increase the color. The microscope readily shows the presence of flour, turmeric, and other vegetable admixtures; but to detect the inorganic impurities recourse must be had to chemical analysis. The husks, separated by the sieves in the manufacture of mustard, yield by expression a bland fixed oil which is used for burning and other purposes; the cake left after expressing is used as a manure, it being too pungent for cattle food.—The two kinds of mustard seed differ in their chemical constituents, which in both are rather complex. The activity of black mustard seeds depends upon a volatile oil which does not exist ready formed in the seeds, but is developed only by the contact of water. The seeds contain myronic acid, in which sulphur is found in combination with oxygen, hydrogen, carbon, and nitrogen. Another principle is myrosine, an albuminoid which is affected by heat, alcohol, and other agents in the same manner as albumen. In the presence of water, myrosine and myronic acid react upon one another, and produce the volatile oil of mustard, or sulpho-cyanide of allyle, an exceedingly acrid and pungent liquid, which promptly blisters when applied to the skin. White mustard produces no volatile oil, but its activity depends upon a non-volatile acrid principle, which results from the action of myrosine upon sulpho-sinapisine, a con-

stituent of the white mustard seed only. Another respect in which white mustard seed differs from the black is the mucilage contained in the husks, which is readily imparted to boiling water.—Mustard has been employed in medicine from very early times, and is mentioned by Theophrastus and Galen, and it is still much used in domestic and professional practice. The whole seeds of the white mustard were at one time a popular remedy in dyspepsia; given in the dose of a tablespoonful, they probably served as a mechanical stimulus to torpid bowels. Serious inflammation has followed their use, and it should not be undertaken without advice. The flour of mustard is a useful emetic always at hand in case of poisoning or other emergency; the dose is from a teaspoonful to a tablespoonful stirred in a tumbler of water. As a topical stimulant, in the form of a mustard poultice or sinapism, it is in frequent use; when the mustard is pure, its action is sufficiently prompt if mixed with an equal bulk of rye meal or wheat flour; but much of that found in the shops is already so far diluted as to be nearly inert. For this or any other use the mustard should be mixed with cold or tepid water, as hot water coagulates the myrosine and prevents the development of the active principle. The ready-made mustard plaster sold by druggists consists of the black seeds reduced to a coarse powder, which is sprinkled upon paper or stiff cloth on which a coat of thick mucilage has been spread; when dry this will keep well, and when required for use is rendered active by dipping it in tepid water and bound upon the desired spot; this is more certain in its action and more cleanly in use than any other form of sinapism. As mustard varies so much in strength, and the skin of individuals in susceptibility, the action of mustard when applied should be closely watched, else a troublesome ulcer may be produced; this is especially necessary when the patient is unconscious.—As a condiment the uses of mustard are well known; it is mentioned by Shakespeare in "Taming of the Shrew," act 4, scene 3, though it did not become common until the time of George I. The English and Americans usually mix mustard with water and a little salt, but the French and Germans prepare it with various flavoring articles and usually cook it, depriving it of much of its pungency. The imported French mustard is of various flavors, that containing tarragon being much esteemed; celery seed, garlic, cloves, anchovies, and other things are used, and in some cases a peculiar flavor is given by stirring the mixture with a hot poker. German mustard is mixed with vinegar in which black pepper, cinnamon and other spices, and onions have been boiled, with salt and sugar added; the vinegar is used boiling, hence the mustard is very mild; it improves by keeping.—Wild mustard, the charlock of English farmers, is *brassica sinapis-trum* (formerly *sinapis arvensis*), a troublesome

weed in European agriculture, and equally so in the grain fields of some of the older parts of the United States; it bears a general resemblance to the two species already noticed, but its leaves are less divided, and the nearly smooth pods have their seed-bearing portion longer than the stout two-edged beak, which is either empty or one-seeded. The seeds of this, if buried so low that they will not germinate, retain their vitality for a long time, and have been known to vegetate when brought to the surface after having been buried more than 40 years. Sheep are exceedingly fond of it, and are sometimes used to clear a field of charlock. In Japan, India, and other countries related species are cultivated for their leaves as food, or for their seeds to furnish oil.—The attempts to identify the plant mentioned as mustard in the New Testament have given rise to much discussion; some still hold that the black mustard, which in Palestine grows 10 or 12 ft. high, is the plant, while others refer it to *Salvadora Indica*, which according to Boyle was the mustard tree of the Jews. The order *Salvadoraceæ* is a small one closely related to the jasmine family.—Hedge mustard is *sisymbrium officinale*, a common, much-branched, unsightly weed, of the same family; it is the *herb au chanfre* of the French, who formerly held it in esteem as a remedy for the hoarseness of singers. Tansy mustard is *S. canescens*, with finely divided leaves, common from New York southward.

MUTINA. See MODENA.

MUTINY (Fr. *mutin*, refractory, stubborn; *mutiner*, to rise in arms). A century ago the word mutiny was, as we learn from lexicographers, often used in describing insurrection or sedition in civil society; but it is now applied exclusively to certain offences by sailors and soldiers. Properly it is the act of numbers in resistance of authority; but by statutes certain acts of individuals are declared to be mutiny. The act of congress of March 3, 1835, defines mutiny or revolt in the following language: "If any one or more of the crew of any American ship or vessel on the high seas, or any other waters within the maritime and admiralty jurisdiction of the United States, shall unlawfully, wilfully, and with force or by fraud, threats, or other intimidations, usurp the command of such ship or vessel from the master or other lawful commanding officer thereof; or deprive him of his authority and command on board thereof; or resist or prevent him in the free and lawful exercise thereof; or transfer such authority and command to any other person not legally entitled thereto; every such person so offending, his aiders and abettors, shall be deemed guilty of a revolt or mutiny and felony." The same statute provides for endeavors and conspiracies to excite mutiny. In construction of the act it has been held that mere disobedience of orders by one or two of the seamen, without any attempt to excite a general resistance

or disobedience, and insolent conduct or language toward the master or violence to his person, if unaccompanied by other acts showing an intention to subvert his authority as master, are not sufficient to constitute the offence of endeavoring to excite mutiny. An indictment for this crime, it is said, must set forth a confederacy of at least two of the men to refuse to do further duty, and to resist the lawful commands of the officers. The offence of making a revolt was by the act of April, 1790, punishable by death. By the act of 1835, now in force, it is punished by fine not exceeding \$2,000, and by imprisonment and confinement at hard labor for not more than 10 years, according to the nature and aggravation of the offence; while attempts to excite mutiny are punishable by fine not exceeding \$1,000, or by imprisonment not exceeding five years, or by both. Sailors refusing to go to sea from reasonable apprehension of the unseaworthiness of the vessel are not punishable as for a revolt under the act; neither are those who refuse to do duty after a deviation from the voyage named in the shipping articles. Mutinous conduct in the army and navy is provided for by the acts of April 10, 1806, and of April 23, 1800. In the navy it is punishable with death; in the army with death or such other punishment as a court martial may inflict.

MUTTRA, a city of British India, in the Northwestern Provinces, capital of a district of the same name, on the W. bank of the Jumna, 30 m. N. N. W. of Agra; pop. in 1872, 51,540. It is picturesquely built on high ground in the form of a crescent, and was once well fortified. Flights of stone steps, or ghauts, adorned with temples, lead down to the river, which is accounted sacred by the Hindoos, and every day crowds of devotees frequent its banks to perform their religious rites. The streets are steep, narrow, and dirty, and rendered more difficult by deep ravines which run through the town. There are some striking ruined buildings, among which is a fort, having on its roof an observatory with astronomical instruments. One of the most beautiful edifices is a temple and dwelling house together, built by a former treasurer of the state of Gwalior, and approached through a richly carved gateway. The British have extensive cantonments about a mile distant. Muttra is held in great reverence by the Hindoos as the birthplace of Krishna, and is overrun with sacred monkeys, bulls, paroquets, and peacocks, which are fed and protected, but allowed to go at large in the streets. The wealth and importance of the place were formerly much greater than at present. Mahmoud of Ghuzni sacked it in 1017, and carried off or destroyed an enormous amount of treasure. Among other rich specimens of handicraft, he found five idols of gold with eyes of rubies, and 100 idols of silver, each as large as a camel could carry. At the commencement of the present century the town was taken by Sindia, who bestowed it

on the French adventurer Perron; and in 1803 it was occupied by the British troops, and soon afterward ceded to the East India company. A detachment of sepoys mutinied at Muttra in the latter part of May, 1857, shot their British officers, and marched to Delhi.

MUTTRA, or **Matara**, Arabia. See **MUSCAT**.

MUYSCAS, or **Chibchas**, a nation of South American Indians in what is now the United States of Colombia. They were highly advanced in civilization, founded an empire, and reduced all the tribes between Serinza, lat. 6° N., and Suma Paz, 4° S., including the table lands of Bogotá and Tunja. At the time of the Spanish conquest the Maysca or Chibcha empire, including the less civilized conquered tribes, had a population estimated by Acosta and Uricoechea at 1,200,000, and by others at 2,000,000. They were divided into three independent nations, governed by the *zipa* residing at Funza, the *zaqui* at Tunja, and the *jeque*, an ecclesiastical chief residing at Sogamoso. The greatest of the line of zipas was Sagnanmachica. They honored Nemterequeteba as the great mythical civilizer of the race. They worshipped the sun and a number of inferior deities, but offered human sacrifices only to the sun. They had two great temples at Suamoz and Leiva. Their priests were called *jeques*. They made offerings by throwing precious objects into the lakes. They had a kind of week of 3 days, 10 making a month; 20 months were a year, and 20 years an age. Succession was in the female line. They cultivated maize, potatoes, and quinoa, and made a spirituous liquor of maize; used rafts and balsas in fishing; raised cotton, and spun and wove cloth, in which they were decently dressed. They wore square mantles, some of them dyed and painted. They were ingenious carvers of bone, wood, and stone, and worked in precious metals. They were a commercial people, had a rude kind of money, and carried on a trade in painted mantles, gold ornaments, salt, and emeralds. They taught parrots to talk, and sacrificed them instead of human beings. Their houses were of wood and clay, with conical roofs, surrounded by a palisade. The floor was covered with mats, and benches were ranged around as seats. They buried in caverns. Chibcha seems to have been their real name, Chibchacum being the national deity. Maysca means men.—The Chibcha language was cultivated by Gonzalo Bermudez, José Dadei, and Bernardo de Lugo (*Gramática mosca*, Madrid, 1619). There is a recent *Gramática, vocabulario, catecismo i confesionario de la lengua Chibcha*, by E. Uricoechea (Paris, 1871). There is no *d*, *l*, or *r*. There are two conjugations, and inseparable pronouns; there is no variation in tense for person or number, and no gender, case, or number in nouns. The language is generally represented as having been lost about 1765, but it is still spoken by some bands on the Meta, &c., who represent this ancient civilized race.

MUZIANO, Girolamo, an Italian artist, born at Acquafredda, near Brescia, in 1528, died in Rome in 1590 or 1592. He established himself in Rome about the middle of the century, and became known both as a landscape and historical painter. The churches of Rome and other Italian cities contain many fine works by him in oil and fresco; and there is also a celebrated "Christ Washing the Feet of his Disciples" in the cathedral of Rheims, which has been engraved by Desplaces. He was almost equally celebrated as a mosaic worker. His chief architectural work is the chapel of Gregory XIII. in St. Peter's. He was instrumental in founding the academy of St. Luke at Rome, the brief for the establishment of which he procured from Gregory XIII. Many of his pictures have been engraved.

MUZZEY, Artemas Bowers, an American clergyman, born in Lexington, Mass., Sept. 21, 1802. He graduated at Harvard college in 1824, and at the Cambridge divinity school in 1828, and was ordained pastor of the Unitarian society in Framingham, Mass., June 10, 1830. He resigned this post in May, 1833, and became pastor successively of the Unitarian churches in Cambridgeport, Jan. 1, 1834; Lee street, Cambridge, in July, 1846; Concord, N. H., in March, 1854; and Newburyport, Mass., Sept. 3, 1857, from which he retired in May, 1865. He has published "The Young Man's Friend" (1836); "Sunday School Guide" (1837); "Moral Teacher" (1839); "The Young Maiden" (1840), which has passed through many editions; "Man a Soul" (1842); "The Fireside" (1849); "The Sabbath School Hymn and Tune Book" (1855); "Christ in the Will, the Heart, and the Life," a volume of sermons (1861); "The Blade and the Ear, Thoughts for a Young Man" (1864); "Value of the Study of Intellectual Philosophy to the Minister" (1869); "Leaves from an Autobiography," in the "Religious Magazine" (1870-'72); "The Higher Education" (1871); and numerous tracts, sermons, and essays, and reports on common schools and Sunday schools.

MYCALE (now *Samsun*), a mountain in the south of Ionia in Asia Minor. It is the W. extremity of Mt. Mesogis, and runs out into the sea in a promontory called Mycale or Trogylium (now Cape Santa Maria), directly opposite Samos, from which it is separated by a strait three fourths of a mile wide. This strait was the scene of the great naval victory of the Greeks under Leotychides and Xanthippus over the Persian fleet in September, 479 B. C. On the N. side of the promontory was the temple of Neptune, where the Panionic festival of the Ionian confederacy was held. On or near the promontory there appears to have been a city of the same name.

MYCENÆ, or *Mycene*, a city of ancient Greece, situated on a rocky hill at the N. E. extremity of the plain of Argos. It is said to have been founded by Perseus, and its massive walls were deemed the work of the Cyclops. It is spoken

of as the favorite residence of the Pelopidæ, and as the principal city of Greece during the reign of Agamemnon. From the period of the Dorian conquest its importance declined; but it still maintained its independence, and in the Persian war contributed its quota of troops. This brought upon it the enmity of the other Argives, who about 468 B. C. laid siege to Mycenæ, reduced it by famine, and destroyed it. It was never rebuilt, but its remains, near the modern village of Kharvati, are among the grandest and most interesting of the antiquities of Greece. Part of the walls of the acropolis, to the height in some places of 15 or 20 ft., are still standing, and at the N. W. angle may yet be seen the great entrance to the citadel, styled the "gate of lions" from the two beasts, considered lions, sculptured in a triangular block of gray limestone, supported by two massive uprights. Some suppose that it represented the altar of the deity of the sun, worshipped at Mycenæ. The most remarkable of

Gate of Lions, Mycenæ.

its other antiquities is the subterranean vault commonly called "the treasury of Atreus," consisting of two chambers, the larger of which is of circular form, 40 ft. high and 50 ft. broad. The lintel of the entrance is formed by two huge blocks, the lower of which is 25 ft. long, 20 ft. wide, and 4 ft. thick, and the other, still covered with earth, is probably of the same dimensions. Except in the ruins of Baalbek, these are the largest blocks found in the walls of buildings. The circular room consists of numerous horizontal rows of stones placed above each other in circles gradually diminishing in diameter. Several archaeological societies and private persons, among them Schliemann, have recently entered upon negotiations with the Greek government for the disinterment of the entire acropolis.

MYCONI, or *Mycono* (anc. *Myconus*), an island of Greece, in the Ægean sea, one of the Cyclades, lying E. of Delos and N. of Naxos,

about 10 m. long and 6 m. wide; pop. about 6,000. Its highest summit has two peaks, whence Pliny calls it *dimastrus*. Corn, wine, cotton, and figs are produced. In ancient times it was famous for the number of bald persons among its inhabitants.

MYER, Albert J., an American meteorologist, born in Newburgh, N. Y., Sept. 20, 1828. He graduated at Geneva college in 1847, took the degree of M. D. at the university of Buffalo in 1851, and in 1854 was appointed assistant surgeon in the United States army. From 1858 to 1860 he was on special duty in the signal service, and in the latter year was made major and chief signal officer in the army, serving in New Mexico and the Rocky mountains till May, 1861. In June he was made signal officer on the staff of Gen. Butler at Fortress Monroe, and afterward of Gen. McClellan, and took part as chief signal officer in nearly all the engagements during the peninsular campaign. In November, 1862, he took charge of the signal office at Washington. He was successively brevetted as lieutenant colonel, colonel, and brigadier general, the last being for "distinguished services in organizing, instructing, and commanding the signal corps of the army, and for its especial service Oct. 5, 1864," at Alatoona, Ga. He was made colonel and chief signal officer in the army in July, 1866, and introduced a full course of study of signals at West Point and Annapolis. By virtue of an act approved Feb. 9, 1870, he was charged with the special duties of the observation and giving notice by telegraph and signals of the approach and force of storms on the northern lakes and seacoast, at the military posts in the interior, and at other points in the states and territories. He organized the meteorological division of the signal office, being assigned to duty according to his commission as brevet brigadier general in June, 1871. By an act approved March 3, 1873, he was placed in charge of the special duties of telegraphy, &c., being authorized to establish signal stations at lighthouses and at such of the life-saving stations as are suitable for the purpose, and to connect these stations by telegraph with such points as may be necessary. In 1873 he was a delegate to the international meteorological congress at Vienna. He has published a "Manual of Signals for the United States Army and Navy" (1868).

MYERS, Peter Hamilton, an American novelist, born in Herkimer, N. Y., in August, 1812. He has published "The First of the Knickerbockers, a Tale of 1673" (New York, 1848); "The Young Patroon, or Christmas in 1690" (1849); "The King of the Hurons" (1850), republished in England under the title of "Blanche Montaigne;" and "The Prisoner of the Border, a Tale of 1838" (1857). He has also written several tales, and "Ensenore, a Romance of Owasco Lake," and other poems. He now (1875) resides in Auburn, N. Y.

MYGALE. See SPIDER.

MYLITTA, the Greek name of the Babylonian goddess Beltis or Bilit, "the Lady." She is commonly represented as the wife of Bel-Nimrod (Belus), and the mother of his son Nin, though she is also called the wife of her son Nin. She united the characteristics of the Juno, Venus, and Diana of classical mythology, but was chiefly the goddess of birth and fertility. She had temples at Nineveh, Ur, Erech, Nipur, and Babylon. The Baaltis of the Phœnicians was the same in name and character. The young women of Byblos, like those of Babylon, sacrificed in her service their virginity, and gave the price they received to the temple of the goddess. The Derceto of Ascalon, the Ashera of the Hebrews, and the Ish-tar of the Babylonians were kindred divinities.

MYLODON (Gr. *μύλη*, mill, and *ὀδός*, tooth), a genus of gigantic fossil edentates established by Prof. Owen, and closely allied to the sloth, resembling *megalonix* and *megatherium*. The mylodon has the heavy form of the megatherium, with a dentition resembling that of the megalonyx; the molars are $\frac{4}{5}$ — $\frac{5}{6}$, and are worn into flat surfaces; in the upper jaw, the first is subelliptical and separated from the rest, the second elliptical, and the others triangular, with the internal surface grooved; in the lower jaw, the first is elliptical, the third quadrangular, and the last the largest and bilobed, and the symphysis stronger than in the megalonyx. The head resembles that of the megatherium in its form, and has a strong descending process of the zygomatic arch; the extremities are equal, the anterior five-toed, and the posterior four-toed; the two external fingers are without nails, and the others have large semi-conical and unequal claws; the acromion and coracoid are united, the radius turns around the ulna, the tibia and fibula are distinct, the heel bone long and large as in the other megatherioids. (See *MEGALONYX*, and *MEGATHERIUM*.) The *M. Darwinii* (Owen) was discovered by Mr. Darwin in northern Patagonia; the symphysis of the lower jaw is long and narrow, with the second molar subelliptical, and the last with two furrows, of which the internal is angular; it is found from the pampas of Brazil southward. The *M. Harlani* (Owen) has the symphysis shorter and wider, the second molar square, and the last with three grooves, the internal one biangular; this has been found in Kentucky, Mississippi, Missouri, South Carolina, and Oregon. The *M. robustus* (Owen) is characterized by a short and wide symphysis, with the second molar subtriangular, and the last with three grooves, of which the internal is rounded. A fine and nearly complete skeleton of this species is now in the museum of the London college of surgeons; it was discovered in 1841 in the fluviatile deposits about 20 m. north of Buenos Ayres, recently elevated above the level of the sea. The skeleton is very robust; the trunk, shorter than that of the hippopotamus, ends in a pelvis as wide as and deeper than that of the elephant; the hind

limbs short and massive, with feet as long as the thigh bones, set at right angles to the leg, and with the sole turned slightly inward; the tail as long as the hind limbs, very thick, and affording a firm support in the semi-erect position; the chest long and large, protected by

Mylodon robustus (restored).

16 pairs of ribs, broad and strongly attached to a well developed sternum; the scapulæ unusually broad; arm bones thick and short, with strong processes for muscles; the bones of the forearm longer than those of the leg; the skull smaller than that of the ox, but long, narrow, with a truncated muzzle, and supported by a short neck of seven vertebræ; dorsal vertebræ 16, with broad and high spinous processes nearly equal and having a uniform backward inclination. Such proportions are found in no living animals, and only in the megatherioids among fossils. The skull presented two extensive fractures, from which the animal had recovered; the air cells extend from the frontal and ethmoidal sinuses into the cranial bones, separating the two tables of the skull sometimes for the extent of 2 in., forming a great protection against injury from falling limbs of trees. They were probably peaceful animals like the existing sloths, though able to inflict severe wounds by their sharp and heavy claws; the muscular strength of the edentates is very great, and must have been immense in all the megatherioids. While presenting the closest affinity to the small arboreal sloths, the mylodon, with its claw-armed inner toes, had the outer thick and stunted, and evidently enveloped in a kind of hoof, giving the power of standing and walking firmly as well as digging and seizing—in this respect marking a transition between edentates and pachyderms. It is now generally admitted that this animal commenced the process of prostrating trees by scratching away the soil from their roots, and loosening them from their attachments; then, seizing the branches or trunk, and supported on the hind limbs and tail, it swayed the tree

to and fro, and soon brought it to the ground to be stripped at its leisure; in case of meeting a tree too large to be uprooted, it is probable that some of the smaller species, as indicated by the inward turning of the soles, possessed the faculty of climbing to the larger branches within reach of the foliage. In regard to the means of stripping off leaves, Prof. Owen, from the cavity in the mastoid process for the articulation of the hyoid bone, and the large size of the anterior condyloid foramina whence issue the motor nerves, maintains that there was a remarkable development of the tongue; this is also indicated by the broad, smooth, concave surface of the symphysis of the lower jaw, which, with the absence of incisors, offered no obstacle to its free motions, and provided space for it when retracted; the megatherium had a short proboscis, prehensile lips, and a smaller tongue in a narrower mouth; the elephant has a maximum proboscis, the giraffe a maximum tongue, the megatherium being intermediate; the mylodon, having no proboscis, had a largely developed tongue for stripping off foliage, contrasting in this respect with the almost tongueless elephant. While the megatherium may have measured 18 ft. from the fore part of the skull to the end of the tail, following the curve of the spine, the mylodon measured only 11 ft.; other measurements in these animals respectively were: circumference at pelvis $14\frac{1}{2}$ and $9\frac{3}{4}$ ft.; length of skull $2\frac{3}{4}$ and $1\frac{1}{2}$ ft., greatest width $1\frac{1}{2}$ and $\frac{1}{2}$ ft.; length of lower jaw $25\frac{1}{2}$ and $15\frac{1}{2}$ in., width at symphysis $5\frac{3}{8}$ and $5\frac{1}{8}$ in.; length of anterior limb 10 and $4\frac{1}{2}$ ft.; clavicle 15 and $8\frac{1}{2}$ in., humerus $2\frac{1}{2}$ and $1\frac{1}{8}$ ft., ulna $25\frac{1}{2}$ and $14\frac{1}{2}$ in., radius 26 and 11 in.; fore foot $31\frac{1}{2}$ and 14 in. long, and $14\frac{1}{2}$ and $8\frac{1}{2}$ wide; middle and longest claw $10\frac{1}{2}$ and $5\frac{1}{2}$ in.; width of pelvis 61 and 41 in.; length of femur $28\frac{1}{2}$ and 19 in., circumference over great trochanter $3\frac{1}{2}$ and $2\frac{1}{2}$ ft., and width at same point 16 and 9 in.; tibia 22 and $8\frac{1}{2}$ in.; length of hind foot $34\frac{1}{2}$ and 19 in., width 12 and $6\frac{3}{4}$; heel bone 17 and $7\frac{1}{2}$ in.; middle and largest claw $9\frac{1}{2}$ and $5\frac{1}{8}$ in.; and width of largest vertebra of tail 21 and $10\frac{1}{2}$ in.—The scelidotherium (Gr. σκελῖς, hind leg, and θήριον, animal) is another extinct megatherioid, remarkable for the size of the hind limbs; a nearly entire cranium shows the essential characters of the sloth's skull, with the mylodontal modifications of the complete zygoma and shape of the lower jaw; the teeth were $\frac{2}{3}$ — $\frac{2}{3}$, the upper triangular; the form was massive. Pictet mentions seven species, varying in size from a hog to an ox, which lived in South America during the diluvial epoch. Some other genera have been described by Owen, Pictet, and Leidy.

MYRIAPOD. See CENTIPEDE.

MYRMECOBIUS, a genus of marsupial animals, established by Waterhouse, of which the typical species is the *M. fasciatus* of southern and western Australia. The teeth are very numerous, being incisors $\frac{2}{3}$, canines $\frac{1}{2}$ — $\frac{1}{2}$, premolars $\frac{3}{4}$ — $\frac{3}{4}$, molars $\frac{2}{3}$ — $\frac{2}{3}$ =52. The fore feet are

five-toed, with sharp nails for climbing and digging; hind feet four-toed, all free; head elongated, and snout acute; body slender; tail moderate and bushy. Length 10 in., tail 7 in. additional. The general color of the fore part of the body is reddish, gradually shading into the black of the posterior half, which has seven to nine white transverse bands; fur coarse above and finer underneath, below fulvous

Myrmecobius fasciatus.

white. They have no pouch, the young, five to eight in number, being protected by the long hairs of the under side of the body. They are gentle, active, and squirrel-like animals, feeding on insects, especially ants, which they obtain by their long and extensile tongue, and on sweet vegetable juices; they are seen generally on trees, in whose hollows they live. The fossil *amphitherium* or *thylacotherium*, of the lower oolite of Stonesfield, England, resembled the myrmecobius, as also did the *dromatherium* of the trias of North Carolina, and the *microlestes* of the trias of central Europe.

MYRMELEON. See ANT LION.

MYRMIDONES, an ancient Achæan race of Phthiotis in Thessaly. According to the legendary account, they originally came from Ægina, where, at the request of Æacus, Jupiter changed all the ants (*μύρμηκες*) of the island into men, who from their origin received the name of Myrmidones. They subsequently followed Peleus into Thessaly, and accompanied his son Achilles in the expedition against Troy. Other legends make them the descendants of Myrmidon, a son of Jupiter and Eurymedusa, whom the god deceived in the disguise of an ant. They do not appear in authentic history. From them is derived the word *myrmidons*, designating a band of rough soldiers or ruffianly marauders devoted to the will of a leader.

MYRON, a Greek sculptor, born in Eleuthera, Bœotia, about 480 B. C. Besides representing the human figure in difficult attitudes, he modelled animals with success. His masterpieces were nearly all in bronze. The most celebrated were his *Discobolus*, or quoit player, and his "Cow." There are several marble *Discoboli* still extant, copies of the original. Of his other works, perhaps the most famous were his colossal statues of Jupiter, Minerva, and Hercules at Samos, which were carried off by Mark Antony. Augustus restored Minerva

and Hercules to the Samians, retaining only Jupiter, which he placed in the capitol.

MYRRH (Heb. *mor*), a gum resin mentioned in the Old Testament as an article of commerce, and one of the oldest medicinal articles of which we have any record. Though the drug has been well known for many centuries, its origin was long obscure; it was once supposed to be produced by an *acacia*, and it has been attributed to other genera. Nees von Esenbeck in 1826 described the myrrh-yielding tree from specimens brought home by Ehrenberg as *balsamodendron myrrha*, and this was accepted as the plant till 1863, when Berg in studying the specimens found that the one indicated by Ehrenberg as furnishing myrrh was quite different, and he described it as *B. Ehrenbergianum*, in honor of the collector. The genus *balsamodendron*, by some referred to *terebinthaceæ*, is now placed in *Burseraceæ*, a small family of plants which have aromatic resinous juices, and are nearly related to the orange and rue families. About six species of the genus are recognized, all shrubs or small trees inhabiting Africa, Arabia, and other parts of Asia; the general character of their foliage and flowers is shown in the illustration. The drug, which is probably the product of more than one species, is a natural exudation, which may be increased by wounding the bark of the tree; it is at first light yellow and soft, but becomes darker and harder as it dries. Like many other eastern drugs, myrrh is known in commerce by the names of the places whence it is exported rather than those which produce it, and we have Turkey or Smyrna, and East

Myrrh (*Balsamodendron Ehrenbergianum*).

Indian or Bombay myrrhs, though they are collected in Arabia and Abyssinia. Myrrh occurs in lumps or tears of variable size, which are whitish upon the exterior from the powder produced by attrition; it is brittle, reddish yellow or reddish brown, semi-transparent,

and with a dull oily kind of fracture; its odor is aromatic, characteristic, and pleasant to most persons; it has an aromatic and bitter taste. Though known in commerce as gum myrrh, it is a true gum resin, containing nearly 28 per cent. of two kinds of resin, about 64 per cent. of gum, some volatile oil, &c. It is imported in chests of about 200 lbs., which contain lumps of various qualities; it is sorted by the dealers into myrrh of two or three grades. The chests often contain inferior gums added accidentally or intentionally; one of the most frequent is a gum resembling senegal, which is readily recognized by its shining fracture and lack of proper taste; bdellium, also found as an impurity, is distinguished by being softer and darker colored. Alcohol dissolves the resin and volatile oil of myrrh, leaving the gum, and a tincture represents the active portions of the drug. When triturated with water the gum dissolves, and the finely divided resin and oil are held in suspension and form a milky emulsion, one of the forms in which myrrh is administered. The Hebrews employed myrrh in preparing the ointment for the rite of consecration, and it is mentioned as one of the articles used in the purification of women, in embalming, and as a perfume. It is now employed in medicine as a stimulant and tonic; it is seldom prescribed alone, but with preparations of iron and vegetable bitters; it is given in doses of from 5 to 20 grains or more. Externally myrrh is employed to stimulate indolent ulcers and to dress wounds that are slow of healing, and is a popular remedy for soft and spongy gums, for which purpose the tincture largely diluted with water is used. It has been proposed to utilize the residue after the preparation of the tincture for the manufacture of a coarse mucilage.

MYRTLE, a name which, with or without a prefix, is given to several widely different plants, but properly belonging to *myrtus communis*, an evergreen shrub of the Mediterranean region, which is the type of a very large and important order, the *myrtaceæ*. The myrtle family consists of trees or shrubs, with simple, entire, mostly aromatic leaves, which are marked by pellucid or resinous dots, and are without stipules; the flowers are perfect, the calyx tube adherent to the ovary, and the petals and numerous stamens borne upon the throat of the calyx tube or upon a disk which borders it; the fruit a berry or capsule; seeds without albumen. This family abounds in the tropics and the southern hemisphere; a few species belonging to the genera are found in southern Florida. Among the important plants and products of this family are the clove, allspice, guava, cajeput, rose apple, Brazil and Sapucaya nuts, and the gigantic and useful eucalyptus trees of Australia. The common myrtle is a shrub, which even in favorable situations does not exceed 20 ft. in height, with opposite shining leaves and axillary peduncles, each bearing a single white or rose-tinged flow-

er, which is succeeded by a several-seeded berry. The plant, having been so long in cultivation, presents numerous varieties differing in the size and shape of their leaves and color of the fruit; the latter is naturally black, but there are white-berried varieties, as well as those

Common Myrtle (*Myrtus communis*).

with their leaves striped and spotted with white or yellow markings. In England the myrtle is barely hardy in the southern counties, and in our northern states it is only seen as a pot plant, or grown in tubs to decorate the grounds in summer, and removed to the cellar or a pit for the winter. In those southern localities where the camellia and Cape jasmine live without protection the myrtle is hardy. As with many other plants known to the ancients, there are numerous legends attaching to the myrtle; it was sacred to Venus, and the temples of that goddess were surrounded by groves of myrtle; wreaths of it were worn by the Athenian magistrates as symbols of authority, and the victors in the Olympic games were crowned with it. The buds and berries were formerly used to flavor many dishes, and they had a reputation for medicinal properties, the aromatic berries and other portions of the plant being tonic and stimulant. The Tuscans used the plant in the preparation of a wine called *myrtidanum*. At present the chief use of the myrtle is in perfumery. *Eau d'ange* is a very fragrant astringent water, distilled from the flowers; the leaves mixed with other aromatics are used for sachet powders. The wood is hard and handsomely mottled, but its use is confined to small articles of turnery. Bay rum owes its peculiar fragrance to a volatile oil obtained from the leaves of *myrcia acris*, a West Indian plant of this family. The myrtle is readily propagated from cuttings of the just hardening young shoots.—The plant known in this country as myrtle or running myrtle belongs to a very different family. (See

PERIWINKLE.) The candleberry or wax myrtle is *myrica cerifera*. (See BAYBERRY.) Sand myrtle is *leiothymum buxifolium*, a pretty low shrub of the heath family, found in the pine barrens of New Jersey and southward.—Crape myrtle is the common name for *Lagerstræmia Indica*, a shrub largely planted for ornament in Virginia and southward. It does not belong to the myrtles proper, but to the loosestrife family (*Lythraceæ*). It is a much-branched shrub, 6 to 10 ft. or more high, with smooth, oval, opposite leaves, and large panicles of showy flowers; the petals are upon slender claws, and are waved and crimped in such a manner as to give them an exceedingly beautiful appearance, and to suggest the fabric known as crape; the stamens, which are in long silky tufts, add to the beauty of the flowers. The usual color of the flowers is a pale rose, but recently a white and several very dark-colored varieties have been introduced. The plant is a native of the East Indies, and the genus was named in honor of Lagerström, a

Crape Myrtle (*Lagerstræmia Indica*).

Swedish naturalist. In northern localities it may be grown as a tub plant with a treatment like that of the oleander.

MYISIA, in ancient geography, a N. W. division of Asia Minor, the boundaries of which greatly varied at different periods. In the time of the early Roman emperors it was bounded N. by the Propontis (sea of Marmora), N. E. in part by the Bithynian Olympus, S. E. by Phrygia, S. by Lydia, W. by the Ægean, and

N. W. by the Hellespont (strait of Dardanelles). It thus included, among other territories, those of Troas in the northwest, and Teuthrania (which included Pergamus), as well as the Grecian coast land of Æolis, in the southwest. Mysia was for the most part mountainous, the principal ranges within its boundaries being Mt. Ida in Troas, Mt. Temnus, which extended from the former to the borders of Phrygia, dividing the country into two unequal parts, and Mt. Olympus on the northeastern or Bithynian border. Of the principal rivers, the Caicus and Evenus flowed into the Elaitic gulf, on the S. W. corner; the Satniois into the Ægean, N. of Cape Lectum; the Scamander and Simois, renowned in Trojan legends, into the Hellespont, near Cape Sigeum; the Granicus, on the banks of which Alexander the Great achieved his first victory over the Persians (334 B. C.), the Æsepus, Tarsius, Macesus, and Rhyndacus, into the Propontis. The largest gulf was that of Adramyttium (now Adramyti) on the Ægean, opposite the island of Lesbos. Mysia is more renowned in legendary traditions than in history, the chief interest attaching to the territories of Troas, Pergamus, and the Æolian confederacy. Some suppose the Mysians to have been of Thracian race and immigrants from the countries south of the Danube afterward known as Mœsia, and others make them offshoots of the Lydians. Egyptologists think they can recognize their name in inscriptions of very ancient date. Having been successively under the dominion of Croesus, the Persian kings, Alexander of Macedon, his general Lysimachus, and the Seleucidæ, Mysia was assigned by the Romans, after their victory over Antiochus the Great (190), to the new kingdom of Pergamus, which had previously been formed from one of its parts, and with the whole of that kingdom was bequeathed to the Roman republic by King Attalus III., thus becoming a part of the proconsular province of Asia (133).

MYSOORE. I. A native state of India, under British protection, situated between lat. 11° 30' and 15° N. and lon. 74° 45' and 78° 45' E., and surrounded on all sides by the province of Madras, except where bordered by Coorg on the west and Bombay on the north; area, 27,717 sq. m., of which about 9,000 are under cultivation; pop. in 1872, 5,055,412. The state comprises three divisions for governmental purposes, Nandidroog, Ashtagram, and Nagar; the chief towns are Bangalore, Mysore, and Seringapatam. The country consists of an interior table land elevated from 2,000 to 3,000 ft. above the sea, rising westward to the Western Ghauts, which separate it from the seaboard. The principal rivers are the Cavery, Tungabudra, and the N. and S. Pennar. There are no natural lakes, but many large tanks and artificial reservoirs in the high grounds. The level of the table land is interrupted in places by large masses of granite, rounded in their outlines, standing singly or in clusters. The cli-

mate is healthful. The average annual rainfall is about 30 inches. Mysore not only produces the grains, vegetables, and fruits common to southern India, but also many of those belonging to the temperate regions. A considerable portion of the surface is covered with jungle. Rice, sugar cane, *ragi*, a species of coarse grain, and wheat are the chief crops raised. The betelnut palm and the castor oil plant thrive well. Carbonate of soda, salt, and iron are found. The inhabitants are principally Hindoos; in 1872 there were 230,518 Mohammedans, 15,241 Christians, 14,600 Buddhists, and 2,843 of other creeds. The Roman Catholics claim about 20,000 converts. Coarse blankets, carpets, shawls, and cotton cloths are manufactured. There are 3,072 m. of roads in the country, and 48½ m. of railway. The total number of schools during 1871-'2 was 2,683, of which 603 were government institutions.—Mysore is mentioned in the Hindoo mythological writings; but the authentic history of the country commences with the Mohammedan invasion in 1326, when it was incorporated with the empire of Delhi. The affairs of that empire soon afterward falling into confusion, Mysore was lost, and some Hindoos escaping from Mohammedan persecution in the north founded a city on the banks of the Tungabudra, which became the capital of a new state comprising nearly the whole of Mysore and part of the Carnatic; but in 1565 its ruler, Ram Rajah, was defeated and slain by the army of a Mohammedan confederation, and his capital taken and depopulated. A Mysorean chief, named Rajah Wadeyar, acquired possession of the fort and island of Seringapatam, and his successors, by a career of aggression, toward the close of the 17th century had extended their authority over the whole table land of Mysore. In 1731 the minister deposed the rajah, and in 1749 Hyder Ali made his appearance as a volunteer in the army of Mysore, and ultimately rose to be sovereign of the country. Upon the death of his son Tippoo Sahib in 1799, the British annexed a considerable portion of his dominions to their Indian possessions, and allotted the territory now known as Mysore to the descendant of the rajah who had been supplanted by Hyder Ali; but the country having fallen into a deplorable condition under his government, Lord W. Bentinck, the governor general of India, placed the civil and military administration in the hands of a British commission, though the rajah still nominally retained authority. The rajah died childless in 1868, and a chief commissioner, who is directly responsible to the governor general of India, now administers the government in the name of the rajah's adopted son, who is a minor. (See HYDER ALI, TIPPOO SAHIB, and SERINGAPATAM.)

II. A city, capital of the state, 7 m. S. S. W. of Seringapatam, and 250 m. W. S. W. of Madras, in lat. 12° 19' N., lon. 76° 42' E.; pop. in 1872, 57,765. The town is built upon two small hills or parallel elevated ridges, 2,450 ft.

above the sea, and is fortified by a wall of earth with a moat, and by a quadrangular fort, within which stands the palace of the titular rajah. The buildings of the town are generally good, and the streets regular and well kept. The want of a sufficient supply of good drinking water is severely felt, and is the main cause of the unhealthiness of the place. Carpet making is the chief industry. Mysore has always been the nominal and historic capital of the district; but it was neglected in favor of Seringapatam by Hyder Ali and his son, and has only recovered from its position of secondary importance within the present century.

MYSTERIES (Gr. *μυστήρια*, from *μύειν*, to shut the lips), ceremonies in ancient religions to which only the initiated were admitted. They may be obscurely traced in the early Orient, in the rites of Isis and Osiris in Egypt, in the Persian Mithraic solemnities, and in the festivals introduced into Greece through the worship of Bacchus and Cybele; and they lingered through the decline of Rome, and perhaps left their traces in the ceremonies of freemasonry. They consisted, in general, of rites of purification and expiation, of sacrifices and processions, of ecstatic or orgiastic songs and dances, of nocturnal festivals fit to impress the imagination, and of spectacles designed to excite the most diverse emotions, terror and trust, sorrow and joy, hope and despair. The celebration was chiefly by symbolical acts and spectacles; yet sacred mystical words, formulas, fragments of liturgies, or hymns were also employed. There were likewise certain objects with which occult meanings that were imparted to the initiated were associated, or which were used in the various ceremonies in the ascending scale of initiation. The sacred phrases, the *ἀπόρρητα*, concerning which silence was imposed, were themselves symbolical legends, and probably not statements of speculative truths. The most diverse theories have been suggested concerning the origin, nature, and significance of the Hellenic mysteries. As Schömann remarks (*Griechische Alterthümer*, 3d ed., Berlin, 1873), the very fact that it was not permitted to reveal to the uninitiated wherein these cults consisted, what were the rites peculiar to them, for what the gods were invoked, or what were the names of the divinities worshipped, has been the cause of our extremely incomplete information in regard to them.—The oldest of the Hellenic mysteries are believed to be those of the Cabiri in Samothrace and Lemnos, which were renowned through the whole period of pagan antiquity. Though they were only less august than the Eleusinian, nothing is certain concerning them, and even the names of the divinities are known to us only by the profanation of Mnaseas. (See CABIRI.) The Eleusinian were the most venerable of the mysteries. "Happy," says Pindar, "is he who has beheld them, and descends beneath the hollow earth; he knows the end, he knows the divine origin of life."

They comprised a long series of ceremonies, concluding with complete initiation or perfection. The fundamental legend on which the ritual seems to have been based was the search of the goddess Demeter or Ceres for her daughter Proserpine, her sorrows and her joys, her descent into Hades, and her return into the realm of light. The rites were thought to prefigure the scenes of a future life. The same symbol was the foundation of the Thesmophoria, which were celebrated exclusively by married women, rendering it probable that initiation into it was designed to protect against the dangers of childbirth. The Orphic and Dionysiac mysteries seem to have designed a reformation of the popular religion. Founded upon the worship of the Thracian Dionysus or Bacchus, they tended to ascetic rather than orgiastic practices. Other mysteries were those of Zeus or Jupiter in Crete, of Hera or Juno in Argolis, of Athena or Minerva in Athens, of Artemis or Diana in Arcadia, of Hecate in Ægina, and of Rhea in Phrygia. The worship of the last under different names prevailed in divers forms and places in Greece and the East, and was associated with the orgiastic rites of the Corybantes.—More important were the Persian mysteries of Mithra, which appeared in Rome about the beginning of the 2d Christian century. They were propagated by Chaldean and Syrian priests. The austerity of the doctrine, the real perils of initiation which neophytes were obliged to encounter, the title of soldier of Mithra which was bestowed upon them, and the crowns which were offered to them after the combats preceding every grade of advancement, were among the peculiarities which gave to these rites a military and bellicose character; and Roman soldiers eagerly sought initiation into them. The fundamental dogma of the Mithraic doctrine was the transmigration of souls under the influence of the seven planets, over whose operations Mithra presided. The whole fraternity of the initiated was divided into seven classes or grades, which were named successively soldiers, lions, hyænas, &c., after animals sacred to Mithra. The sacrifice of the bull was characteristic of his worship. On the monuments which have been found in Italy, the Tyrol, and other parts of Europe, inscribed *Deo Mithræ Soli Inviscto*, Mithra is usually represented as a young man in a flowing robe, surrounded with mystical figures, seated on a bull, which he is pressing down, or into which he is plunging the sacrificial knife. A dog, a serpent, a scorpion, and a lion are arranged near him. Nothing is certain concerning the signification of this scene. After the adoption of some of the ideas connected with other religious systems, as those of the Alexandrian Serapis, the Syrian Baal, and the Greek Apollo, the Mithra worship disappeared in the 5th or 6th century.—See Creuzer, *Symbolik und Mythologie* (1810-'12), translated into French with elaborate annotations by Guigniaut and others

(1825-'36); Sainte-Croix, *Recherches historiques et critiques sur les mystères du paganisme*, edited by Sylvestre de Saoy (1817); Seel, *Die Mithra-Geheimnisse während der vor- und urchristlichen Zeit* (1823); Limbourg-Brouwer, *Histoire de la civilisation morale et religieuse des Grecs* (1833-'41); Lajard, *Recherches sur le culte public et les mystères de Mithra* (1847-'8); Maury, *Histoire des religions de la Grèce antique* (1857); and Preller, *Römische Mythologie* (2d ed., 1865), and *Griechische Mythologie* (3d ed., 1872).

MYSTERIES, mediæval dramas. See **MIRACLES** and **MORALITIES**.

MYTHOLOGY (Gr. *mýthos*, a saying, and *lógos*, discourse), the science of myths. The ancient Greeks applied the term *mýthoi* to all classes of narratives, but especially to their religious and poetic traditions of gods, heroes, and remarkable events, and hence *μυθολογία*, mythology, came to be a synonyme of *ἀρχαιολογία*, archæology. Though mythology is still understood to embrace all the traditions and legends of a people, especially of ancient peoples, yet it is more commonly confined to accounts of and researches into primitive polytheistic religions. There are myths of all nations, and among uncivilized races they are still current and in course of formation. Max Müller's recent work on comparative religion and mythology ("Introduction to the Science of Religion," London, 1873), with an essay on the philosophy of mythology, is the first successful attempt at laying before the English public the results of the speculations of German scholars on this subject. German literature has of late produced an extensive array of works which undertake to describe the probable processes of the evolution of mythology, or religion, or moral and religious sentiments in general. Such are Caspari's *Urgeschichte der Menschheit* (Leipsic, 1873), Hellwald's *Culturgeschichte in ihrer natürlichen Entwicklung* (Augsburg, 1874 et seq.), and Peschel's *Völkerkunde* (Leipsic, 1874). Max Müller says: "There is this common feature in all who have thought or written on mythology, that they look upon it as something which, whatever it may mean, does certainly not mean what it seems to mean; as something that requires an explanation, whether it be a system of religion, or a phase in the development of the human mind, or an inevitable catastrophe in the life of language." According to some, mythology is history changed into fable; according to others, fable changed into history. Some discover in it the precepts of moral philosophy enunciated in the poetical language of antiquity; others, a picture of the great forms and forces of nature, particularly the sun, the moon, and the stars, the changes of day and night, the succession of the seasons, and the return of the years. According to this last theory, to understand the origin and significance of myths, one must enter into the childlike spirit of those who conceived them. Man instinctively turns to the light. In the

second half of the day he sees the sun gradually sink and disappear, and feels the pleasant warmth depart. His own body loses strength, and sleep overpowers him. At his waking he sees the light gradually return, the sun rise, the plants revive, and the animals come forth from their retreats. He perceives his powerlessness in these ever-recurring scenes, and he conceives a fear for the invisible forces which every day rob him of light, warmth, and life. Summer is followed by winter, and darkness and cold seem to gain daily in strength. Then comes spring; the powers of light and warmth regain the ascendant, and everything is rejuvenated and renewed. In tropical climes this change of season is ushered in by dreadful thunder storms and great floods of rain. Primitive races, the children of humanity, do not know what causes the warring of the elements. To explain it, they have to draw upon their imagination, and to believe what their fancy can supply. They consider themselves to be the centre of a great contest between beings who hate or love them, persecute or shield them. They give to these beings forms with which they are acquainted, and conceive them either as men or as animals. The earth is peopled from above, and hence there are in the heavens beings like those here below. As the chief interest of the transmundane powers rests in man, the good and evil spirits are often in the midst of human habitations. They are difficult to distinguish from ordinary men and animals, but as they must be adored or propitiated, it is to be presumed that they bear some distinctive sign by which man may recognize them. Though it is possible thus plausibly to elaborate theories of the origin of myths, the earliest records of ancient peoples exhibit mythological conceptions far beyond these primitive ideas. Even Egyptian inscriptions, of which some are perhaps from 5,000 to 7,000 years old, bear witness to the existence of an already highly developed mythological system, unfolded by some sacerdotal class.—The inhabitants of Lower Egypt differed in religious ideas and practices from those of the upper Nile. At Memphis Ptah was the object of the highest adoration. He is the father of the god of the sun, and presumably the ruler of the region of light and the god of fire. He is symbolized by the *scarabæus sacer*, an insect believed to propagate without bearing. Ra was the supreme divinity at On or Heliopolis, near Memphis. Manetho names him second to Ptah. The solar disk supported by two rings is his symbol, and the male cat, the light-colored bull, and the hawk are sacred to him. He is the god of the sun, rejuvenating every morning and creating all that exists below the heavens. Eight children of Ptah were worshipped at Ashmunein or Hermopolis. They are the gods of the elements, on whom the various forms of created beings depend. Female deities were worshipped at Sais, Buto, and Bubastis. Neith, adored at Sais, is the cow which bore the sun,

the mother of the gods, who represents the creative power of nature. The goddess of Buto the Greeks compared to their own Leto, the parent of Apollo, the solar deity. Bast or Pasht, the Greek Artemis, had her temple at Bubastis. She is represented either with a solar disk on her head, or as having the head of a cat, the animal sacred to her, and the festivities connected with her worship resembled those of Venus in Greece and Rome. In Upper Egypt Amun, the Greek Ammon, or "the hidden," is the creating, sovereign god, represented by Ptah at Memphis. He is a phallic god, sitting upon a throne, and having upon his head the two plumes, symbolizing dominion over the upper and the lower country. The goddess Maut or Mut, who bears the crown of Upper Egypt, is the mother and mistress of darkness. Shu, Sos, or Sosis, the son of Amun and Maut, was worshipped principally at Thinis and Abydos, as the spirit of the air and the bearer of the heavens. Tum or Atmu represents the sun in his nocturnal course, and Mentu or Mandu the setting sun. Tum, in some respects the equal of Amun and Ptah, generated himself, and is the father of the gods. Khem, whom the Greeks likened to Pan, is a phallic god. Khnum, Num, Knu-phus, or Kneph regulates the overflowing of the Nile. The goddess Hathor received adoration both in Upper and Lower Egypt, especially at Aphroditopolis, near Memphis, and at Edfoo and Denderah. To her are consecrated mirth, orgies, and the dance. She is generally represented as holding a tambourine in her hand, but sometimes merely as a cow. The mythological conceptions in regard to Isis, Osiris, and Horus have been given at length in separate articles. Seb and Nut, the Greek Cronos and Rhea, are the spirits of the earth and the firmament. Typhon, says Plutarch, was called Set by the Egyptians; the ass was sacred to him, and his symbol is an unknown, strange-looking animal. It is remarkable that even in their higher civilization the Egyptians continued to look upon animals as incarnations or representatives of their gods. The bull represented the gods who created life; the cow, the goddesses of conception and birth; the hawk and the cat, gods of light or of the sun; the *scarabæus*, Ptah; the vulture, Nut and Isis; a sort of ibis, Thoth; and the crocodile, Seb. The priest recognized the incarnated gods among these animals by various signs, and introduced them into the temples. The holiest of the chosen animals was the bull in the temple of Ptah at Memphis. He was the famous Apis, born of a cow which conceived him by a spark from heaven, or by a moonbeam. (See APIS.) The *ardea purpurea*, a species of heron with two long plumes on its head, generally appears at the time of the overflow of the Nile, which is the fertile season in Egypt; and hence also these birds, called *bennu* by the Egyptians, were regarded as manifestations of the god of life. With this

bird are connected the well known legends of the phoenix. Herodotus says the Egyptians were the first who believed in the immortality of the soul. For the general character of their ritual, the "Book of the Dead," see EGYPT, LANGUAGE AND LITERATURE OF.—The Accadians, who inhabited the lower regions of the Tigris and Euphrates before the time of Babylonia and Assyria, divided the universe into heaven, the earth and atmosphere, and the lower regions, ruled respectively by Anu, Ea, and Mulghe, probably corresponding to the subsequent first Chaldean triad of Anu, Nua, and Bel. Ea had a consort in Daokina. Ninghe and Ninghel seem to have been chthonian goddesses. The Accadian hell seems to have borne some resemblance to the Chaldean hell. As both demons and good spirits were to be found there, it is to be supposed that it was conceived of as a general tarrying place until the coming of the day when, as they believed, all the dead would assemble and live again. In regard to the subsequent Babylonian mythology, Diodorus says there were 12 gods of the heavens, each personified by one of the signs of the zodiac and worshipped in a certain month of the year. El or Il was the highest of these gods, and Babel, meaning the gate of El, was named after him. It seems that all the gods were local, or that each city and its neighborhood was supposed to be under the special protection of a particular deity. The importance of the various gods hence depended on the political rank of their districts. The gods of the Babylonian pantheon were associated also with appropriate goddesses. It is difficult to distinguish the attributes of El from those of Bel, whose name, meaning lord, is equally applicable to all the gods. That Bel and El were distinct gods appears from inscriptions which speak of them as being both lords of Sumir and Accad. Bel was the presiding god of Nipur, and retained his position as the national god of the Chaldeans until the rise of Babylon. Anu, Bel, Hea, Sin, Shamas, Bin, and the planetary divinities Adar, Merodach, Nergal, Ishtar, and Nebo (the divinities of the planets Saturn, Jupiter, Mars, Venus, and Mercury), were the principal of the numerous gods mentioned in the inscriptions. Anu, who often has the epithet of *malik* or king, appears to have been the Anu-malik or Anamelech of the Scriptures. Hea appears as the lord of the earth and king of the rivers; and Anu and Bel formed with him at an early period a sort of triad, presiding over the other gods. The mythological ideas attached to Sin, Shamas, and Bin are clearer. Sin, the moon god, came into importance when the seat of government was removed to Ur, his special seat. He had the symbol of the new moon, and was called the eldest son of Bel. Shamas, whose sign was the circle, came into prominence with the city of Larsa. He was god of the sun and ruler of the day. Bin is spoken of as the god who thun-

ders in the midst of the heavens, in whose hand there is a flaming sword, and who is the giver of abundance and wealth.—The Himyarites of southern Arabia are said to have worshipped the sun, the moon, and minor demons. There are many indications that the Sabaeans gave to the sun a prominent place in their worship. Himyaritic inscriptions mention the name of Almakah, a moon goddess, and of Athtar, the Babylonian Ishtar. The Nabatheans are said to have worshipped the sun, and also Dusares, a god of war. The Arab tribes commonly symbolized their deities by white and black stones. The highest god of the Midianites and Amalekites, who occupied the Sinaitic peninsula and the neighboring districts, was Baal, whom also the Moabites adored. Thus the religious conceptions of the Arabs did not vary greatly from those of Babylon and Nineveh. Still more marked are the similarities between the worship of the Phœnicians (and the Canaanites in general) and that of the Chaldeans and Assyrians. But the former is more lascivious and cruel, and does not put the same emphasis on the worship of the stars. The Phœnicians ascribed the authorship of their sacred books, which were said to be of high antiquity, to Esmun, one of their gods, and a series of hierophants, including Thabion, Isiris, Sanchuniathon, and Mochus. Philo of Byblos is considered to have given a Greek translation of the books ascribed to Sanchuniathon in his history of the Phœnicians, and the extant fragments indicate that he looked upon many of the gods as deified rulers and heroes. Amplifying and correcting his account from other sources, Max Duncker concludes that El was the principal god of the Canaanites also, and that Saturn was his planet. Above him, however, was Baal-Samin, the lord of the heavens, representing probably the beneficent effects of the sun. Springs and rivers also entered into the worship of the Phœnicians, and specially sacred was the Nahr Damur, north of Sidon, the Tamyras of the Greeks. The goddess Baaltis, mentioned by Greek authors as the Derceto of Ascalon and the Atargatis of Hierapolis, and compared by them to Aphrodite Urania, resembled the Bilit or Mylitta of the Babylonians, and the Ashera of the Hebrews. She was the goddess of birth and fertility, and symbolized the beneficent effects of moisture and water. Her worship was often held at the seashore and on the banks of rivers, and her images sometimes represent her with a body merging at the waist in that of a fish. Many Phœnician colonies adored a Venus of the sea, and the goddess of Berytus was said to have come out of the sea. Dagon, the fish god of the Babylonians, was also regarded by the Phœnicians as a god of fertility, and connected with the water, though his province seems to have been the land; he was the inventor of the plough and the giver of crops. Moloch symbolized the parching heat of the sun. He was the god of fire, purifying as well as devouring. He was

the god of war, and before a battle and after a victory he received large sacrifices of human beings. It is said that he was represented as a bull, or had the head of one; and as Adar, to whom the Babylonians gave the form of a bull, was the spirit of Saturn, it is probable that Moloch also was connected with that planet. Astarte, the divinity of Sidon, who as goddess of war held a spear and was represented in Carthage as riding on a lion, bore some relation to the moon, and was called the horned Astarte (Ashteroth Karnaim in the Scriptural form), probably in reference to the horns of the moon on her head. She was the goddess of fire, and human sacrifices were made to her. She represented chastity; to serve her was to subdue all passion; and emasculation and other self-mutilations were highly pleasing to her. The attributes of both Baal and Moloch were united in Melkart, "king of the city," whom the inhabitants of Tyre considered their special patron. The Greeks called him Melicertes, and identified him with Hercules. By his great strength and power he turned evil into good, brought life out of destruction, pulled back the sun to the earth at the time of the solstices, lessened excessive heat and cold, and rectified the evil signs of the zodiac. In Phœnician legends he conquers the savage races of distant coasts, founds the ancient settlements on the Mediterranean, and plants the rocks at the strait of Gibraltar, the end of the world, as landmarks of the extent of his journeyings. As goddess of the moon Astarte was brought into connection with Melkart, the god of the sun, becoming his spouse, assuming the name of Milkath, and changing from the severe and cruel goddess of war and chastity into a gentle patron of love and fruitfulness. Under the names of Dido and Anna the two sides of her worship reappear especially in Carthage. As Dido she was the wandering goddess of the moon, parallel to Europa, and possessed the attributes of Astarte only. Melkart finding and espousing her, she changed into Anna, the graceful. In like manner Astarte became an Asherah, and Artemis or Athena an Atargatis. The people of Byblos worshipped an *addon* (lord) Tammuz, who is generally identified with the Greek Adonis. The Phœnicians combined the deities of their cities into a sort of system, forming a circle of seven gods, called Kabirim (Cabiri), the powerful or the great, and children of Sydyk, the just. Among these gods were Khusor or Vulcan, the worker of iron; the female Khusarthis, or Thuro, the law, whom the Greeks call Harmonia, and who in many respects resembles Astarte; and Baal-Melkart, the patron of Tyre. An eighth god of this series seems to have been Esmun, "the eighth," who appears as a saving and pardoning divinity, and somewhat like the Thoth of the Egyptians and Hermes of the Greeks. The images of these eight patron gods were often carved on the bows of Phœnician vessels.

Next to the Kabirim were demons, and by degrees was formed a system of divinities of three times seven, or, with Esmun, 22 gods, arranged according to the Phœnician alphabet, and often put into fanciful relations to each other.—The mythological conceptions entering into the religious systems of other races of the East will be found treated in the articles **BUDDHISM**; **INDIA**, **RELIGIONS AND RELIGIOUS LITERATURE OF**; **KORAN**; **ZEND AVESTA**; and **ZOROASTER**.—The principal divinities of the ancient Greeks and Romans are treated under their own titles; but the prominence of these in modern culture calls for a syncretical survey of the entire theogony and body of myths, and also for the characteristic features of the worship. Numerous systems of classification have been devised, but the most serviceable for ordinary purposes is a simple grouping according to the abodes and the spheres of activity attributed to the principal gods and godlike beings. The divinities of heaven are Uranus, Zeus, Hera, Helios, Selene, Eos, Iris, and Æolus; of the water, Poseidon, Amphitrite, tritons, sirens, Nereids, naiads, Scylla, and Charybdis; of the earth, Ge or Gæa and Rhea; of the fields, woods, and gardens, Demeter, Pan, Faunus, Terminus, Flora, Pomona, Pales, Vertumnus, and nymphs; of the house and domestic life, Hestia, lares, and penates; of time, the Horæ and Cronos; of the arts, trades, and sciences, Hephæstus, Athena, Apollo, Artemis, Hermes, and the muses; of love and joy, Aphrodite, Eros, the Graces, Hebe, Ganymede, Dionysus, satyrs, and Silenus; of health, Æsculapius and Hygiea; of war and peace, Ares, Bellona, Eris, and Janus; of fate, justice, and retribution, Fatum, Nemesis, Ate, Moiræ or the Fates, Themis, Erinnyes or Eumenidæ, Harpies, Thanatos, and genii; and of the lower or infernal world, Pluto, Persephone, Grææ, Gorgons, Manes, Nyx, and Hypnos. Exclusively Roman divinities among these are Janus, Faunus, Terminus, Vertumnus, Pales, Flora, genii, lares, penates, and manes. In adopting the Greek mythology the Romans transferred to it the names of their own divinities and their own legends, or gave to the Greek names a Latinized form. Thus Cronos they called Saturnus; Uranus, Cœlus; Gæa, Terra; Helios, Sol; Zeus, Jupiter; Poseidon, Neptunus; Ares, Mars; Hephæstus, Vulcanus; Hermes, Mercurius; Hera, Juno; Athena, Minerva; Artemis, Diana; Aphrodite, Venus; Eros, Amor; Hestia, Vesta; Demeter, Ceres; Dionysus, Bacchus; Persephone, Proserpina; Selene, Luna; Eos, Aurora; Hypnos, Somnus; and the Moiræ, Parcæ; and these Latin names have prevailed in modern literature. The Greeks considered their gods as possessed of human form, sometimes rather gigantic and superhuman, and of great beauty. They needed to eat and drink and sleep. They were subject to suffering, for they could be wounded, and though called blessed they were not free from sorrows and tribulations. They were holy and just, but

irascible and hard-hearted, and at times seducers of human beings. They were truly divine, for they knew no age, and were immortal. They could foretell what would befall a person; but otherwise much must have been hidden from them, for even Jupiter could be deceived, and the other gods could deceive each other. They sometimes moved among men in any form they chose, and visibly or invisibly. They could send signs and messages, such as were announced by the oracles of Dodona, Delos, and Delphi, or by the cries, chirping, eating, or flight of birds, or by thunder and lightning, or by the peculiar formation of the entrails of certain animals. They maintained their bodily and spiritual faculties in their original youth and strength by living on ambrosia and nectar. Certain animals and plants were their emblems or sacred to them. They were worshipped in images of wood, bronze, or marble, placed on hills and mountains, or in groves and forests, and generally removed from the thoroughfares of daily life. Only the lares and penates were household gods. The worship consisted in prayer, vows, or sacrifices. Prayer was commonly offered standing, the head covered, and the hands extended upward, or laid on the mouth, or touching the altars of the gods or the knees of their images. When the gods of the upper region were to be propitiated, the people dressed in white, and the ceremonial consisted partly in bathing and washing, and raising the hands toward heaven. When the divinities of the lower regions were invoked, the dress was black, the hands were pointed downward, and only black animals were sacrificed. Bloody sacrifices, which took place in the earliest times of Greek history, were resorted to only in propitiation for a whole tribe or people. They consisted sometimes of human beings, and in such cases one commonly suffered death for all; but generally they consisted of eatable domestic animals. The blood of the slaughtered animal was poured upon the altar, the portion designed for the god was burned upon it, and the remainder was distributed among the priests and sacrificers. Other sacrifices consisted mainly in libations, as wine, honey, milk, and oil, and the burning of frankincense, and fruits and sweets. The myths or mythical traditions, and the heroes or demigods who figure in them, are an important element in the mythology of the Greeks and Romans. The myths may be divided into three groups: those with one hero, those with entire generations of heroes, and those which recount tribal or national expeditions. The principal myths relating to single heroes are those of Prometheus, Deucalion, and Tantalus. Among those of heroic races or families are the Corinthian myths of Sisyphus and Bellerophon; the Argive myths of Inachus, Danaüs, Danaë, Perseus, and Hercules; the Attic myths of Cécrops and Theseus; and the Theban myths of Cadmus and Œdipus. The myths of national expeditions are the Argonau-

tic, the two Theban wars, and the Trojan war. The myths of Evander, Æneas, and Romulus are Roman. The heroes or demigods were of both divine and human descent, or rather human beings elevated to the rank and honor of gods. The masses generally looked upon them as having been the great men of primitive times, and paid homage to them only as such. In order to facilitate the understanding of the great deeds which the myths ascribed to them, they were imagined as having been persons of superhuman strength. They all differ from the gods in that they were mortal, though a few were permitted to continue for a while their existence in Elysium. Hercules is the only one who becomes immortal. The worship of heroes consisted in offerings of honey, wine, oil, and milk. Animals also were sacrificed to them, but with the caution of twisting the heads downward, and making the blood flow into a ditch. Further, the meat was not eaten, but burned; and only the tombs of the heroes could be used for their worship.—The mythology of the Scandinavian or Norse races, preserved mainly in the literature of Iceland, accounts for the existence of the world by placing in the beginning a Ginungagap, an empty space, with a Nifheim, a region of mist, ice, and snow, to the north, and a Muspelheim, a region of warmth and sunlight, to the south. The ice melting and dropping into Ginungagap, there came to be an accumulation of matter, out of which arose Ymir, the giant, who brought forth Reimthursen, the frost. His nurse was Audhumla, the cow, which lived by licking the ice, and in consequence of her licking appeared the form of Buri, the father of Burr, the father of Odin. Vili and Ve, Odin's brothers, overthrew the dynasty of Ymir and Reimthursen. Ymir's flesh, blood, and bones became the earth, sea, and mountains, and his skull and brains the heavens and the clouds. In Jötunheim were the giants, and Ymir's eyebrows served as a wall between them and the inhabitants of the earth. The clouds and the wind were subject to Odin, the god of war, and the father of Saga, the goddess of poetry. On his shoulders sat the ravens Herginn and Muninn, which he sent out to bring him news of passing events. At his side sat Frigga, his favorite, who controls all nature. Freyja, the custodian of the dead, claimed half the heroes slain in battle. Both were also goddesses of love, and at different times the one or the other was considered the wife of Odin. Thor, Odin's son, the god of thunder and lightning, held a hammer as a symbol of his authority, and threw down from his abode in heaven thunderbolts made by the black elves that dwelt in the interior of the earth. He presided also over the domestic hearth and the fruitfulness of wedlock. Baldur or Baldr, the sun, the father of daylight, had been made invulnerable except by the mistletoe, and Loki, son of the giant Farbauti and

god of mischief, ordered Hodr, the blind god of winter, to slay Baldur with a twig of it. Loki thought to escape by plunging into the sea and changing into a salmon, but was caught in a net, and bound till the judgment day. Hodr was killed by Bali, Odin's son. The wolf Fenris, the progeny of Loki, bit off the hand of Tyr, the god of war and athletic sports, and was also bound, and on the judgment day he will be slain by Vidarr, the god of twilight, next in strength to Thor. The serpent of Midgard (which is the middle world, between Muspelheim and Niflheim, and formed from Ymir's body) was thrown by Odin into the sea, where it grew so large as to encircle the whole world; as was also Hel, a goddess half black and half blue, who lived upon the brains and marrow of men. On Midgard was Asgard, the dwelling of the Asa race, namely, Odin and the twelve Æsir: Thor, Baldur, Freyr, Tyr, Bragi, Hodr, Heimdalr, Vidar, Vali, Ullr, Ve, and Forseti. The gods and goddesses lived apart, the former in the mansion called Gladsheim and the latter in Vingolf. In Valhalla Odin caroused with dead heroes, and was waited upon by Oskmeyjar or Valkyries. Freyr, whose attributes are not clearly defined, is called by Dasent the god of rain, sunshine, and fruits, whom Gridr captivated with her beauty. Iduna, the wife of Bragi, the god of poetry and eloquence, dwelt in the lower world, where she was custodian of the golden apples with which the gods rejuvenated themselves. Ullr was god of the chase, and Mimir of wisdom and knowledge. Heimdalr is the watchman of the bridge Bifrasta, that leads to the lower world, and his horn will give the signal for the great battle of the gods at the end of time. In the article EDDA are some additional details of the mythological conceptions of the Scandinavians.—The mythology of the Germans is built upon the same foundation as that of the Scandinavians, and many portions of it are identical. The principal deities are the same. Wuotan, or Wotan according to the Low Germans, is the Odin of the North. The atmosphere and the heavens are subject to him, and on him depends the fruitfulness of the earth. He takes pleasure in the brunt of battle and in the excitement of the chase. He rides upon a white horse, and his gigantic form is robed in a large dark mantle. Donar, the Scandinavian Thor, the god of storms, swings a heavy hammer or a thunderbolt. He is the giver of increase, and the fruits of the field, the cattle, and wedlock are under his protection. The Tyr of the Norse finds a counterpart in the Tui or Saxnot of the Saxons, the Ziu of the Swabians, and the Eru of the Bavarians. His symbol is the sword; he is the god of war, but originally he was a god of heaven. Fro, who seems to have answered to Freyr, unites various not well defined mythological attributes. Baldur or Phol, who was principally worshipped in Thuringia, is a youthful warrior, and somewhat connected with the blessings of the season of spring. The Frisians

gave him a son named Fosite, the Forseti of Norse mythology. The goddess called Nerthus by Tacitus, which name was subsequently corrupted into Hertha, whom the Franks worshipped as Holda or Holle, the Bavarians as Perchta, and the Low Germans as Fria or Frigg, appears to have been known first to the early inhabitants of the island of Rügen in the Baltic. Her attributes are those of kindness and motherly care. She presides over the blessings of wedded life, house, and field, and rules the land of the dead. For the minor deities of the Germanic races, rather of a legendary than of a mythical character, see FAIRIES. See also DEMONOLOGY.—See Creuzer, *Symbolik und Mythologie der alten Völker* (3d ed., Leipsic, 1837-'44); Keightley, "Mythology of Ancient Greece and Italy" (2d ed., London, 1865); Preller, *Römische Mythologie* (2d ed. by Köhler, Berlin, 1865); Leitschuh, *Die Entstehung der Mythologie und die Entwicklung der griechischen Religion* (Würzburg, 1867); Baring-Gould, "Origin and Development of Religious Belief" (London, 1869-'70); George W. Cox, "The Mythology of the Aryan Nations" (London, 1870); Schömann, *Griechische Alterthümer* (3d ed., Berlin, 1871-'3); Preller, *Griechische Mythologie* (3d ed. by Plew, Berlin, 1872 *et seq.*); Kirchner, *Grundrisse der Mythologie und Sagen Geschichte der Griechen und Römer* (Gera, 1872); Gubernatis, "Zoological Mythology" (London, 1873); Murray, "Manual of Mythology" (London, 1873); Petiscus, *Der Olymp, oder Mythologie der Griechen und Römer* (Leipsic, 1873); Delaunay, *Moines et Sibylles dans l'antiquité judéo-grecque* (Paris, 1874); Kroon, *Mythologisch woordenboek* (Arnheim, 1874 *et seq.*); Holtzmann, *Deutsche Mythologie* (Leipsic, 1874); Lenormant, *La magie chez les Chaldéens* (Paris, 1874); Schrader, *Ishtar* (Berlin, 1874); "Records of the Past: Translations of Assyrian and Egyptian Monuments" (London, 1874 *et seq.*); and Duncker, *Geschichte des Alterthums* (4th ed., Leipsic, 1874).

MYTILENE, or *Mitylene* (anc. *Lesbos*), an island of the Grecian archipelago, belonging to Turkey, separated from the coast of Asia Minor by a strait from 7 to 10 m. broad; area, 276 sq. m.; pop. previous to the Greek revolution, 60,000, since reduced to less than 40,000. On the south it is indented by two deep bays called Ports Caloni and Iero, the former extending to the centre of the island. Both have very narrow mouths, and expand as they stretch inland. The surface is diversified by wooded hills and beautiful plains; the soil is fruitful, and the climate salubrious, but the means of irrigation are imperfect. The principal products are olives, wine, fruit, silk, cotton, and pitch. The chief town is Castro, or Mitylene, on the E. coast, which receives considerable business as a port on the steamboat route to Constantinople. The principal merchants are Greeks. The town was considerably damaged by an earthquake in 1867.—The ancient Lesbos

was one of the islands of the Æolians, and at a very early period contained several rich and populous cities, of which Mytilene and Methymna were the most important, on account of their fine harbors for the coasting trade. After the island had undergone several revolutionary changes, Pittacus about 600 B. C. usurped the dictatorship, restored order, and laid the foundation for the future greatness of the city of Mytilene. While continental Æolis became

subject to Persia about 550 B. C., Lesbos maintained her independence several years longer. About 500 it joined the revolt of the Ionians, but without success. After regaining its independence it became a member of the Athenian confederacy in 477, but revolted in the beginning of the Peloponnesian war, 428, and once more in 412, both times suffering severely. With the exception of a short period during which it was under Spartan sway, Lesbos con-

Mytilene.

tinued subject to Athens till 387. In 334 it submitted to Alexander. In the 1st century B. C. the island was under the dominion of Mithridates, and after his defeat it was annexed to the possessions of Rome. In the 13th century one of the Byzantine emperors ceded it to the Venetian family of Gateluzzi as the dowry of his sister; it was taken from them in 1462 by Mohammed II., who besieged the chief city and captured it through treachery. It was the birthplace of the poets Terpaner, Arion, Alcæus, and Sappho, of the philosophers Pittacus, Cratippus, and Theophrastus, and the historians Hellanicus and Theophanes.

MYXINIDS, an order of fishes, which, with the cyclostomes or lampreys, form the class of myzonts of Agassiz, containing the lowest of the vertebrates. They form the family *hyperotreta* (Müll.; *marsipobranhii* of Huxley),

perforated, and the cavities of the nose and mouth communicate (as in no other fish); the upper margin of the mouth has a single tooth, and the tongue has a double recurved row on each side; the jaws are absent, and the inferior margin of the mouth is formed by the anterior extremity of the tongue bone; the eyes are concealed; the branchiæ are on each side, with internal ducts leading to the œsophagus. For full details see the papers of J. Müller in the "Transactions of the Berlin Academy" for 1834, 1838, 1839, and 1842, and papers by F. W. Putnam in "Proceedings of the Boston Society of Natural History," vol. xvi., 1874. In the genus *myxine* (Linn.) two spiracles approximate on the lower surface behind the branchiæ, each receiving the external ducts of the six branchiæ of its own side. The common myxine or glutinous hag (*M. glutinosa*, Linn.) has a smooth eel-like body, with a very

Organs of Respiration in the Myxine: *a*, single hooked tooth; *b b b b*, double rows of lingual teeth; *c*, branchial cells; *d d d d*, tentacula; *e*, mucous glands.

and are characterized by a cylindrical body, obliquely truncated anteriorly; the mouth is furnished with cirri or tentacles, the palate is

Common Myxine (*Myxine glutinosa*).

long dorsal fin continued round the tail to the vent, a single spiracle on the head, and eight barbules around the mouth; the color is bluish

brown above and whitish below; the length is from 6 to 15 in. Linnæus placed this animal among worms, regarding the two lateral parts of the tongue as transverse jaws, which do not occur in vertebrates. It is the lowest of vertebrates, except the lancelet. The specific name is derived from the great quantity of viscid mucus secreted by the cutaneous glands whose pores open along the under surface of the body; the spinal column is a soft and flexible cartilaginous tube, with no division into rudimentary vertebrae. It is called borer from its habit of eating into the bodies of other fish which have been caught on hooks, entering the mouth or other part of the surface, and in this way is often annoying to fishermen during spring and summer. It is found along the

coasts of Great Britain and in the northern seas, on the N. E. coast of North America, and the S. coast of South America. In the genus *heptatrema* (Dum.) or *bdellostoma* (Müll.) there are six or seven branchiæ on each side, each with an external spiracle; the eyes are very small, conspicuous through the skin. It resembles the preceding genus in internal structure, and attains a larger size; it is found in the southern seas, preferring rocky bottoms, where it lies in wait for fishes; it is active, and has remarkable powers of emitting mucus from the skin. The species described as *bdellostoma Forsteri* by Müller and as *B. cirrhatum* by Günther is roasted and eaten by the natives of New Zealand.

MYZONTS. See MYXINOIDS.

N

N, THE 14th letter and the 11th consonant of the English alphabet, corresponding to the 14th letter of the Phœnician alphabet, the *nun*, the name of which in the Semitic languages signifies fish. The usual sound of the English N, or that which it naturally has when not affected by the neighboring consonants, is that of a lingual nasal. This is in the English language an original sound, derived without change from the earlier languages. There is an epenthetic *n* in *bring* (comp. *brought*), *think* (comp. *thought*); also in some words of Latin origin, as *frangible* (comp. *fracture*), *tangent* (comp. *tact*). The letter *n* final, after *l* or *m*, is silent in English, as *condemn*, *kiln*, *column*, *hymn*; but this *n* was originally sounded. The omission of an *n* is sometimes indicated merely by the lengthening of the preceding vowel, as *goose* (Ger. *Gans*), *tooth* (Lat. *dens*, genit. *dentis*; Mæso-Gothic, *tunthus*), *tithe* (comp. *tenth*). The English *n*, when it comes immediately before a palatal mute, as *c*, *ch* (when pronounced like *k*), *g*, *k*, *q*, or *x*, is a palatal nasal, or has the sound of *ng* final. In *ng* final, the palatal sound has arisen in the same way, although the sound of *g* has been dropped in English. But the suffix *ing* appears to have arisen from the infinitive termination *an* in the earlier language. The Anglo-Saxon and Latin have the same two nasal sounds of *n* as the English. The Mæso-Gothic and the Greek have the two nasal sounds, but express the palatal nasal by *g*. The Latin of the earliest authors had sometimes *g* and sometimes *n* for the palatal nasal. The Sanskrit language has a great variety of *n* sounds.—In numeration, the Greek N signified 50. Among the Romans, according to some authors, N signified 90; according to others 900, and with a horizontal line above it, 90,000.

NABATHEANS. See Edom.

NABIS, a Spartan tyrant who raised himself to supreme power on the death of Machanidas

in 207 B. C. He caused the young son of the deceased king Lycurgus to be assassinated; the most influential citizens were put to death or banished; the wealthy were subjected to incessant exactions enforced by torture, and one of the tyrant's favorite engines of punishment was the figure of a woman which he called after his wife Apega, and which being made to embrace the victim pierced him with spikes projecting from its breast and arms. The money thus obtained enabled him to support a mercenary force to crush the spirit of Sparta, attempt the restoration of the Lacedæmonian ascendancy in the Peloponnesus, and seize the city of Messene. He was forced to withdraw by the Megalopolitan general Philopoemen, but in the next year he returned and reduced the territory of Megalopolis to great distress. On the conclusion of the first Macedonian war, Flamininus, the Roman consul, invaded Laconia with a powerful force, and laid siege to Sparta. Nabis made an obstinate defence, but was ultimately constrained to purchase peace (195). In 192, having again involved himself in hostilities with the Achæans, he applied to the Ætolians for succor. They sent a small force, ostensibly to assist but in reality to overthrow him, and he was soon assassinated by their general Alexamenus.

NABLUS, or *Nabulus*, a town of Palestine, 30 m. N. of Jerusalem; pop. estimated at from 10,000 to 20,000, among whom are about 1,000 Christians and 200 Samaritans. It is situated in a valley at the base of Mt. Gerizim, and is supposed to occupy the site of the ancient Shechem. When restored by the Romans in the reign of Vespasian, it received the name of Neapolis, of which its modern name is a corruption. In the Samaritan synagogue are several valuable manuscripts, the most important of which is the copy of the Pentateuch known as the Samaritan codex. Nablus has important manufactures, especially of soap.

NABOB (Hind. *nawāub*), a title of office in India, applied during the Mogul empire to the imperial lieutenant or viceroy of a province. The word is the plural of *naib*, prince, it being a custom of the natives to address all great men in the plural number. As the power of the emperors declined, their deputies became independent. They made war upon each other, and the country was perpetually disturbed by their contentions. The English, availing themselves of these dissensions, reduced them in detail to mere pensioners on their bounty.—In the English language the word nabob signifies a man who has acquired great wealth in the East.

NACHTIGAL, Gustav, a German traveller, born at Eichstedt, Prussian Saxony, Feb. 23, 1834. He practised medicine in Algeria from 1859 to 1863, when he entered the service of the bey of Tunis as a military doctor, and eventually became his body physician. In 1869 he volunteered to accompany a caravan to Kuka, to convey presents from the king of Prussia to the sheikh of Bornoo in return for his kindness to various German travellers. He left Tripoli Feb. 18, 1869, and reached Moorzook March 27. While the expedition was delayed he explored Tibesti, the country of the Tibboos, and finally left Moorzook April 18, 1870, reaching Kuka July 6. He collected geographical materials about Bornoo, visited Kanem and Lake Tchad, acquiring much valuable information concerning the southern Sahara, and went to Baghirmi, where he explored the Shari and its many branches, returning several times to Kuka. In the beginning of March, 1873, he set out on his return through Waday, passing S. of Lake Tchad to Abeshir, the present capital of Waday. While there he visited Dar Runga, a vassal state, which stretches southward to about lat. 8° N. He arrived at the capital of Darfoor on March 17, 1874, and reached Cairo in November, no European having ever before succeeded in making the journey through from Waday. Petermann published in 1874 his *Die tributären Heidenländer Baghirmis*. For an account of his late explorations see the London "Geographical Magazine" for October, 1874.

NACOGDOCHES, an E. county of Texas, bounded S. W. by the Angelina river and E. by the Attoyac, which unite at the S. E. corner; area, 886 sq. m.; pop. in 1870, 9,614, of whom 3,275 were colored. It has an undulating surface, occasionally hilly and broken, and generally well timbered. The soil varies greatly, but is mostly fertile, cotton and corn being the principal crops. Good iron ore exists. The chief productions in 1870 were 217,861 bushels of Indian corn, 16,515 of barley, 35,113 of sweet potatoes, 4,531 bales of cotton, 62,334 lbs. of butter, and 5,490 gallons of sorghum molasses. There were 1,971 horses, 3,607 milch cows, 9,563 other cattle, 2,470 sheep, and 16,089 swine. Capital, Nacogdoches.

NADIR SHAH, or **Kuli Khan**, a king of Persia, born in Khorasan in 1688, assassinated June 19

or 20, 1747. His father was a maker of sheep-skin caps and coats. For four years Nadir was held in captivity by the Uzbecks, from which at the age of 21 he escaped, and afterward entered the service of the governor of Khorasan. Here he attained high rank, but was degraded and punished, whereupon he placed himself at the head of a band of robbers. The invading Afghans had dethroned the Persian monarch early in the 18th century. Nadir joined Tamasp, son of the shah, with 5,000 men, in 1727, was given the supreme command, drove the Afghan king out of Khorasan, overtook the retreating army at Persepolis, and cut it to pieces. For these services he received in 1730 the provinces of Khorasan, Mazanderan, Seistan, and Kerman, and took the title of Tamasp Kuli (Tamasp's slave), to which Khan was added by the king. In 1731 he defeated the Turks on the plains of Hamadan, and then marched against the Afghans. In his absence Tamasp was defeated by the Turks and signed a treaty ceding them several provinces. Nadir, taking advantage of the popular discontent, proclaimed that he would carry on the war, and in August, 1732, dethroned the sovereign, who was afterward put to death. The infant son of Tamasp was made nominal ruler as Abbas III., but died early in 1736; and at an assembly called to consider the state of the kingdom, Nadir accepted the crown. He had already recovered from the Turks the ceded provinces, and he now moved against the Afghans. He captured the city of Candahar in 1738, and his son Riza Kuli crossed the Oxus and overthrew the ruler of Bokhara and the Uzbecks. Afghanistan was conquered, and Nadir, marching into Hindostan in 1739, defeated the Mogul army, and entered Delhi. The inhabitants of that city rose against their conquerors, and Nadir thereupon ordered a general massacre of Hindoos in every house in which a dead Persian was found. He returned to Persia with plunder amounting to \$100,000,000, including the Koh-i-noor diamond, having also taken from the Mogul emperor the provinces west of the Indus. In 1740 he subjugated the sovereign of Bokhara, and defeated and put to death the khan of Khiva. In his latter years he became capricious and cruel, finally putting whole cities to the sword on the slightest pretext. He had also grown so avaricious that the taxes levied upon the empire were intolerable. At length four noblemen, who learned that their names were in a proscribed list, broke into his tent at night and despatched him. His life was written in Persian by Mirza Mohammed Mahadi Khan, his secretary, and translated into French by Sir W. Jones (London, 1770; English, 1773). A detailed account of his career is given by Malcolm in the second volume of the "History of Persia" (1815), and of his earlier life and conquests by Fraser, whose authorities were Persian manuscripts, in his "History of Nadir Shah" (1742).

NÆVIUS, Cneius, a Roman poet, born probably in Campania between 274 and 264 B. C., died in Utica, Africa, about 204. He served in the first Punic war, settled in Rome, and produced his earliest play in 235, making the stage a vehicle for assailing the aristocracy. For a libel on Q. Cæcilius Metellus he was cast into prison, and obtained his release by two plays, the *Harjolus* and *Leon*, in which he recanted his calumnies. Having again offended, he went into exile at Utica, and employed his latter days upon his epic poem on the "Punic War," a few fragments of which are extant. Fragments of Nævius may be found in several collections of the Latin poets, and in Hermann's *Elementa Doctrinæ Metricæ* (Leipsic, 1852); the most complete and convenient edition is that of Klussmann (Jena, 1843).

NAGASAKI (*i. e.*, Long Cape), a seaport town of Japan, in the province of Hizen, in the west of the island of Kiushiu, the seat of government of the *ken* or prefecture of the same name; pop. about 80,000. The city is sur-

rounded by hills on every side except toward the harbor. It is laid out in rectangles, and a stream of water crossed by 21 bridges flows through it. The hills are covered with temples and groves. The foreign concession is separated from the native town by an arm of the bay. The historic isle of Deshima (outer isle) lies in front of the native town, shaped like an open fan, the handle toward the shore. The harbor is landlocked, deep, spacious, and one of the finest in the world. The surrounding scenery is of exquisite beauty. The city contains a Chinese quarter, in which live nearly 1,000 Chinamen, who carry on a large trade with their own country in medicines, dried fish, isinglass, seaweed, and mushrooms. The exports to Europe and America are tea, tobacco, coal, camphor, and porcelain. Nagasaki is the terminus of two telegraph cables, one to Shanghai, the other to Vladivostok; it is also connected by telegraph with Tokio and Hakodate. It contains a government hospital and college, a patent slip, and dry dock. The sur-

Nagasaki.

rounding country is rich in metallic wealth, and its vicinity to the collieries of Takashima, Karatsu, and Matsushima makes it a good coaling station for the many steamers that ply in the Inland sea and Pacific ocean. It is the chief depot of the trade with China, and the mart for the potteries of Hizen; but the lack of good land approaches hinders its growth. The value of the exports in 1873 was \$1,899,793, and of the imports \$1,626,775, carried in 328 vessels, of 280,972 tons.—Until 1568 Nagasaki was a mere fishing village. The daimio of Omura invited the Portuguese merchants and missionaries to reside here, and conversions and trade multiplied until the village grew into a large city. During the 100 years of Jesuit proselytizing in Japan Nagasaki was the ecclesiastical centre of the new faith, and the annals of missionary zeal, persecution, and massacre have given it great historical prominence. After the expulsion of the Portuguese, the Dutch were ordered to leave their factory at Hirado, and come to Deshima, in which they

lived under surveillance, only one Dutch ship being allowed to come annually to Nagasaki for more than two centuries. In 1854, by the Perry treaty, the harbor was specified as a place of anchorage and supplies for foreign vessels. By the Harris treaty it was opened to foreign commerce. Although S. of the usual course of the typhoons which ravage the coasts of Japan, a cyclone of unusual violence visited Nagasaki in August, 1874, sinking more than 100 junks, damaging steamers, and causing great destruction of life and property in the city. Pappenberg, the precipitous rocky island from which thousands of the native Christians were driven into the sea in 1643, lies in the bay in sight of the city.

NAGOYA, the fourth largest city of Japan, on the main island, in the province of Owari, capital of the Aichi *ken* or prefecture, near the head of Owari bay, about 170 m. W. S. W. of Tokio; pop. about 400,000. The city lies on the great plain of Owari, forming nearly a right-angled triangle, with the river which

drains the castle moats as one of the sides. It is regularly laid out in squares, and the commercial, ecclesiastical, and official quarters are separate. The castle, now containing the government buildings, is one of the largest and strongest in Japan. The temples and monasteries are numerous, wealthy, and occupy much ground. The Tokaido, or main highway of the empire, passes through the city, which has a large inland trade, chiefly by carts and pack horses, and a still larger business by junks and steamers. It is noted for its manufactures of decorated porcelain, lacquered work, wood carving, and fans. It contains a telegraph station and a government college. Seven miles distant is the seaport of Miya.

NAGPORE, or **Nagpoor**, a city of central India, capital of the province of Berar or Nagpore, situated in lat. $21^{\circ} 9' N.$, lon. $79^{\circ} 11' E.$, 420 m. E. N. E. of Bombay, with which city it is connected by a branch of the Great Indian Peninsula railway; pop. about 115,000. It is 7 m. in circumference, but the houses are generally inferior. There are important manufactures of cotton, and silk and cutlery are also made. Two great trunk roads in addition to the railway lead out of Nagpore: one 160 m. to Jubbulpore, the other 180 m. to Raipur in Chaltisghar.—In 1740 Nagpore became the seat of an independent Mahratta sovereignty. On Nov. 26, 1816, the English garrison of 1,400 men were suddenly attacked at Seetabuldee, the heights in the vicinity of the residency, by the rajah's army of 18,000 troops, who were finally repulsed, although with a loss to the British of 333 killed and wounded. The city was annexed to the British dominions with the state of Berar in 1853. A partial mutiny of the Madras sepoy's stationed at Nagpore, on Jan. 18, 1858, was successfully repressed.

NAHANT, a town of Essex co., Massachusetts, 10 m. N. E. of Boston by water; pop. in 1870, 475. It consists of a peninsula, projecting about $3\frac{1}{2}$ m. into Massachusetts bay, and connected with Lynn by a narrow beach of sand and gravel so hard that a horse's footsteps scarcely leave a trace. The extremity, called Great Nahant, is 2 m. long and $\frac{1}{2}$ m. broad, and contains 463 acres. In many places the shore is lined by rocks rising 20 to 60 ft. above the tide; and there are many singular caves and fissures, the most noted of which are the Swallow's cave and the Spouting Horn. A large hotel, erected on the E. extremity in 1824, was burned in 1858, and there are now only three small hotels. The peninsula is chiefly occupied by handsome cottages, used as summer residences by the citizens of Boston. Malis garden, a public picnic ground, occupies about 20 acres along the shore on the N. side, and is adorned with fountains and shell work. Between Great Nahant and the mainland, and about $\frac{1}{2}$ m. from the former, a rocky ridge, called Little Nahant, crosses the beach, rising 80 ft. above the sea, and comprising about 40 acres. A mile E. of Nahant is Egg Rock,

rising abruptly to the height of 86 ft., and crowned by a lighthouse. The town was separated from Lynn in 1853.

NAHE, a river of Germany, one of the affluents of the Rhine. It rises on the confines of Rhenish Prussia and the detached portion of Oldenburg enclosed by that province, and after a tortuous course, first N. E. and then E., of about 60 m., 25 m. of which is navigable, it empties through a portal formed by the Rochusberg on the right and the Rupertsberg on the left into the Rhine at Bingen. There is some fine scenery in the vicinity of Creuznach and Oberstein.

NAHUM, the seventh of the Hebrew minor prophets in order of arrangement. He is designated the Elkoshite, probably from the place of his birth, the location of which is however unknown, contradictory traditions placing it in Galilee and on the banks of the Tigris. He prophesied probably in Judah toward the close of the reign of Hezekiah (about 700 B. C.), after the deportation of the ten tribes, and predicted the destruction of Nineveh and the relief of Judah. His pictures of the wickedness and fall of Nineveh are vivid and powerful, and his diction clear and sonorous. Recent explorations in the East have given fresh interest to the study of this book. There are many commentaries upon it and works illustrating its connections with history. See especially O. Strauss, *Nahumi de Nino Vaticinium* (1853); M. von Niebuhr, *Geschichte Assur's und Babel's* (1857); Vance Smith, "The Prophecies relating to Nineveh" (1857); and Paul Kleinert in Lange's *Bibelwerk*, part xix. (1868).

NAIADS (Gr. *ναιεω*, to swim), in Grecian and Roman mythology, nymphs who presided over fresh waters, and were supposed to inspire those who drank of them with oracular powers and the gift of poetry. They could also restore sick persons to health. They are represented in works of art as beautiful maidens, half draped, and with long hair.

NAIL (Sax. *nægel*; Ger. *Nagel*), a piece of metal, more or less sharp at one end with a head at the other, used to fasten together pieces of wood or other material by being driven into or through them. The principal division is into wrought and cut nails, the former being made from tough wrought iron, the latter from rolled plates. The different sorts are named from the use to which they are applied or from their shape, as shingle, floor, or horse-shoe nails, tacks, brads, or spikes. The term penny, when used to mark the size of nails, is supposed to be a corruption of pound. Thus, a four-penny nail was such that 1,000 of them weighed 4 lbs., a ten-penny such that 1,000 weighed 10 lbs. Originally, the "hundred" when applied to nails was 6 score or 120; consequently the thousand was 1,200.—The making of nails is one of the oldest of the handicraft arts, probably dating as far back as the art of working metals. Before the invention of machinery an immense number of per-

sons were employed in making nails, there having been no fewer than 60,000 nailers in the neighborhood of Birmingham alone. It is only within the last 80 years that machinery has been employed to supersede to any extent hand labor in nail making. It appears, however, that as early as 1606 Sir Davis Bulmer obtained a patent for cutting nail rods by water power. The details of the invention are unknown, and there are no records of English patents prior to 1617. In 1618 a patent was issued in England to Clement Dawbeny for an improvement on Bulmer's machine. But machinery was not put into actual use in England till 1790, when Thomas Clifford of the city of Bristol patented a nail machine. His machines were used in French's factory at Wineburn, Staffordshire, in 1792. He used two iron rollers, faced with steel, in which were sunk impressions, or forms of the nails, half of the form being in each roller, and arranged circumferentially, so that a bar of iron, being passed between the rollers, came through a string of nails, the head of one nail being slightly joined to the point of the next. In the United States, where so many wooden structures had to be erected by the settlers, the obtaining of cheap nails was of the utmost importance. In 1775 Jeremiah Wilkinson of Cumberland, R. I., cut tacks from sheet iron, and afterward nails and spikes, forming the heads in a vice. The first patent issued for a machine for cutting nails is said to have been given to Josiah G. Person, or Pearson, of New York, March 23, 1794. On Jan. 16, 1795, Jacob Perkins of Boston obtained a patent for a cutting machine said to have been invented about 1790, and to have been capable of making 200,000 nails a day. The following year patents were issued to Peter Clifff and to Amos Whittemore of Massachusetts, and to Daniel French of Connecticut. It is said that the first patent for a cutting and heading machine (Nov. 11, 1796) was granted to Isaac Garretson of Pennsylvania; and on Dec. 12, 1796, a patent for a similar machine to George Chandler of Maryland. Ezekiel Reed of Bridgewater, Mass., is also said to have invented a machine for cutting and heading nails at one operation. Afterward several patents were granted to Jesse Reed, Samuel Rogers, and Melville Otis of Massachusetts, to Mark and Richard Reeve of Philadelphia, to Roswell Noble of Baltimore, and others. The machine invented by Jesse Reed, with some later improvements, is that still most largely used. The manufacture of cut nails was soon established in Massachusetts, Connecticut, New York, New Jersey, Pennsylvania, and Maryland. In 1810 Joseph C. Dyer of Boston, but then a merchant in London, took out patents in England for the nail machinery invented in Massachusetts, and large manufacturing establishments were soon put in operation. Some in the neighborhood of Birmingham are able to make over 40,000,000 nails a week. Mr.

Edward Hancorne, a nail maker of London, in 1828 obtained a patent for a nail machine, by which the nail was pointed by swedging it between two oscillating snail pieces or spirals, the rod being cut off by shears and headed by a piece working in a slide propelled by a cam attached to a shaft. In 1834 Mr. Henry Burden obtained a patent for a machine, which with several improvements has been for many years in successful operation at his extensive nail works in Troy, N. Y. Many of the first inventors spent large sums of money on their machines. It has been estimated that it cost more than \$1,000,000 to bring them to the perfection arrived at in 1810, when a machine made about 100 nails per minute. It was at this time that the full value of the invention was brought prominently before the world in the well known report of Albert Gallatin, then secretary of the treasury. Large nail factories were early established in different parts of Massachusetts, and at Ellicott's Mills, near Baltimore. At the present day the business is carried on very extensively in the Schuylkill iron region. There the pigs from the furnace go immediately to the bloomery, thence to the rolling mill, and so on through the slitting and nail-cutting machines, so that all the operations from the crude ore to the finished nail are carried on at the same place.

NAIN, a town of Palestine, in Galilee, mentioned in the New Testament (Luke vii.) as the place where Jesus raised the widow's son to life. It was situated between the Little Hermon and Mt. Tabor, about 6 m. S. E. of Nazareth, and 60 m. N. of Jerusalem. It is now an insignificant hamlet, and is called Nein. The rock near by is full of sepulchral caves.

NAIRNE, Baroness. See OLIPHANT, CAROLINA.

NAIRNSHIRE, a maritime county of Scotland, bordering on the Moray frith, Elginshire, and Inverness-shire; area, 215 sq. m.; pop. in 1871, 10,225. The coast, about 10 m. in extent, is low, sandy, and dangerous. The inland districts are hilly and wooded; those on the sea are well cultivated and productive. The chief rivers are the Nairn and Findhorn. The climate is severe but healthful. Nairn, the capital (pop. in 1871, 4,207), is a favorite watering place. About 5 m. distant are the remains of Cawdor castle, where Macbeth is said to have murdered Duncan. The room which was pointed out as the scene of the deed was destroyed by fire in 1815; but no part of the castle is really older than the 15th century.

NAJA. See COBRA DE CAPELLO.

NAKHITCHEVAN. 1. A town of European Russia, in the government of Yekaterinoslav, on the right bank of the Don, about 30 from its mouth, and 7 m. E. N. E. of Rostov; pop. in 1871, 16,584, mostly Armenians. It stands on an eminence, has manufactures of cotton and silk, and maintains an extensive traffic with Circassia, Astrakhan, Turkistan, and Constantinople, especially in pearls and precious stones. The town was founded in 1780 by a colony of

Armenians, and is the seat of the Armenian patriarch of Russia. II. A city (anc. *Naxuana*) of Russian Armenia, on a plateau near the left bank of the Aras, 83 m. S. E. of Erivan, and 175 m. S. by E. of Tiflis; pop. in 1871, 5,356. The Armenians regard it as the most ancient city in the world, and as the spot where Noah settled after the deluge; and it formerly contained, according to the Persian annalists, 40,000 houses. In antiquity it belonged to Media, and subsequently it became important in Armenia. It was destroyed in the 4th century by the Persians, in the 13th by the Tartars, and in the 17th again by the Persians. Shah Nadir wrested it from Turkey, and the Russians in 1827 from Persia. In 1840 it was partly destroyed by an earthquake.

NAMAQUA, a tribe of S. Africa, inhabiting both banks of the Orange river near the mouth. Their country is divided into Great and Little Namaqualand, and the latter, lying S. of the Orange river, is now absorbed in Cape Colony. The tribe is small, and has been much diminished by disease and famine. They dwell in huts of the old Hottentot style, and speak the Nama, the oldest and purest of the Hottentot dialects. (See **HOTTENTOTS**.)

NAMES, words by which particular objects are indicated. Names of persons were originally usually of a single word, as in the Hebrew genealogies, Terah, Levi, Aaron. The same is true of the earlier names in Egypt, Syria, Persia, Greece, and Italy, and in the Celtic and Germanic nations. All names were originally significant. Among the Hebrews the name given a child originated in some circumstance of its birth, or expressed some religious sentiment; as Jacob, the supplanter; Samuel, God hath hearkened. Sometimes a new name was taken upon some important change in life, as Abraham for Abram. The Greeks bore a single name given the tenth day after birth by the father, and expressing generally some admirable quality; as Pherecrates, strength-bringer; Sophron, wise. The Roman names were in their origin less dignified than those of the Greeks. Some were derived from ordinary employments, as Porcius, swineherd; some from personal peculiarities, as Naso, long-nosed. Many of the Celtic and Teutonic names were derived from "God," as Gottfried, Godwin; others from spirits or elves, as Elfric, elf king.—The Jews after accumulating a considerable stock of names began to repeat them, and in the New Testament we find few new names. Among the later Greeks the eldest son generally bore the name of his paternal grandfather, and the confusion arising from the repetition of the same name was relieved by appending the father's name, either simply or turned into a patronymic, the occupation, the place of birth, or a nickname. This did not however amount to a regular system of surnames. The Romans had a very complete system of nomenclature. The commonwealth was divided into clans called *gentes*, each of which

was subdivided into families. Thus in the *gens* Cornelia were included the families of the Scipiones, Lentuli, Cethegi, Dolabellæ, Cinnæ, Sullæ, and others. Each citizen bore three names, viz.: the *prænomen*, which marked the individual; the *nomen*, which marked the gens; and the *cognomen*, which marked the family. Thus Publius Cornelius Scipio belonged to the Cornelian gens and the family of the Scipiones, while Publius was his individual, or what we now call Christian name. Sometimes a fourth name, or *agnomen*, was given, generally in honor of some military success; as Publius Cornelius Scipio Africanus, and Lælius Cornelius Scipio Asiaticus, his brother. The agnomen, being a distinction of honor, was carefully preserved by the children, and a decree of the senate granted to the elder Drusus the title Germanicus, and also to his posterity. The *prænomen*, like all given names, was commonly indicated by an initial; but the Roman initial indicated one name invariably: C. always meant Caius; M., Marcus. Cneius was indicated by Cn. There were only about 80 recognized *prænomens*. In common intercourse the *prænomen* and *cognomen* were used without the *nomen*, as C. Cæsar for C. Julius Cæsar.—The ruder populations of northern Europe continued to use a single name. There were few surnames in England before the Norman invasion, although some appear in the Saxon records. Many influences united to introduce them. Names once significant lost their meaning and were repeated in memory of those who had borne them; and as many persons bore the same name, some further distinction became necessary. As Christianity prevailed it displaced the old heathen names by names from the Bible; new names were taken in baptism, and sometimes whole companies were baptized, to save trouble, with the same name. Many surnames appear in Domesday Book, but it was not at first common to transmit the surname from father to son. In the middle of the 12th century it was thought essential that persons of rank should bear a surname. Robert of Gloucester says that in the reign of Henry I. a lady objected to marrying a natural son of that king because he had no surname, upon which the monarch gave him the surname of Fitz-Roy, *fitz* being a corruption of *filis*, son; the Russian *vitch*, as in Petrovitch, Ivanovitch, has the same value. After the reformation in England the introduction of parish registers contributed to give permanence to surnames. Yet in the beginning of the 18th century many families in Yorkshire had none, and it is said that even now few Staffordshire miners bear their fathers' names, but are known by some personal sobriquet. Sons took their fathers' names first in the modified form of patronymics; thus, Priamides, son of Priam. Heraclides meant not only a son of Hercules, but a descendant. During the middle ages the Jews formed surnames with the Hebrew *ben* or

Arabic *ibn*, meaning son, as Solomon ben Gabirol, and Abraham ibn Ezra. Among the Saxons we find in A. D. 804 Egbert Edgaring, *ing* denoting descent; and to this origin are attributed such names as Browning, Dering, Whiting. In Wales the surnominal adjunct *ap* was used in the same sense, as David ap Howell; and even in the 17th century combinations were carried up through several generations, so that a man carried his pedigree in his name, as Evan ap Griffith ap David ap Jenkin ap Hugh ap Morgan ap Owen. Sometimes, instead of any patronymic syllable, the father's name was taken in the possessive case, as Griffith William's, or as now written Williams; to which origin may be traced many names ending in *s*. The prefix *mac* was used in a similar manner by the Gaelic inhabitants of Scotland and Ireland. The Irish also used for the same purpose *oy* or *o*, signifying grandson, as O'Hara, O'Sullivan. The use of *fitz*, son, has already been mentioned; while the word "son" added to the father's name gave rise to a great number of names, as Adamson, Johnson. Subsequently convenience dropped the patronymic syllable, or prevented its repetition, and the father's name was taken without alteration as a surname. Thus many originally Christian names have become surnames. The general European system by which the son inherits the father's name still has its exceptions. The present royal family of England has never adopted an unchangeable surname. The same thing is true of many other distinguished houses, as those of Saxe, Nassau, Bourbon, and Orleans. In Spain the wife does not change her surname on marriage, and the son calls himself by the names of both parents, connecting them with the conjunction *y*, and, as Pi y Margall, or chooses either of them alone. Surnames, having been first an individual distinction, were retained by the children for the sake of retaining the honor which they marked. That which was originally a mark of rank was soon imitated and became general. The use of hereditary surnames was established in England by the middle of the 14th century, the system being consolidated by a statute of Henry V. requiring that the name and description of the party should be exactly set forth in any writ or indenture. It was formerly usual in England to obtain a special act of parliament to authorize a change of name, and subsequently to obtain a royal license; but legal authorities have decided that there is nothing in the law to prevent any one from changing his name as he may choose.—The origin and signification of surnames can be traced in very many cases, although some meanings have become obscure, being derived from words now obsolete. Many are local. To this class belong most English names beginning with the French *de*, which retain the name of the old home in Normandy; such names as Burgoyne, from Burgundy; Attemoor, from at and moor; Byfield; Underhill; Barrow, a

hill; Applegate, from *garth*, an orchard. With these should be classed names from the signs of houses, as Thomas at the Dolphin, Will at the Bull, George at the Whitehorse, &c., afterward becoming hereditary, and dropping for convenience the connecting words. Such names as Lyon, Hawke, Raven, and Heron are either local like the above, or have been taken from devices on shields. Many names originated in office or occupation. In Domesday Book occur Guilielmus Camerarius (William the Chamberlain) and Radulphus Venator (Rodolph the Hunter). The most notable name of occupation is Smith, from the Anglo-Saxon *smitan*, to smite, and originally of much wider meaning than now, including wheelwrights, carpenters, masons, and smiters in general. The "Saxon Chronicle" speaks of "mighty war smiths who overcame the Welsh." Many names of this class have the Anglo-Saxon feminine termination, as Baxter or Bagster, the feminine of baker; Webster, of Webber or weaver. It is said that the trade of weaving has been carried on by a Sussex family named Webb since the 13th or 14th century. Spencer is from *dispensator* or steward; Grosvenor from *gros veneur*, grand huntsman. The termination *ward* indicates a keeper, as Durward, doorkeeper; Hayward or Hereward, keeper of the town cattle; Woodward, forest keeper. Various personal characteristics often gave origin to names; as Paulus, little; Calvus, bald; White, Black, Brown, Gray; Read, Reed, or Reid, old spellings of red; Lightfoot; Duff, Welsh for black; Vaughan, little; Gough, red. The names of the ancient Saxon population of England were nearly all descriptive of some quality of mind or body. Thus Edward is truth-keeper; Edmund, truth-mouth; Alfred, all-peace. Some names have become great favorites, and some much used at particular periods have afterward become very unusual; as Patience, Prudence, Faithful, Thankful. There are only about 53 Christian names of men that can be used without appearance of singularity, of which 32 are taken from the Bible. The number of surnames now extant in England is about 40,000. In Scotland there are fewer in proportion to the population, certain names being remarkably frequent in particular localities, from the clansmen having taken the name of their chief.—See Salverte, *Essai historique et philosophique sur les noms* (Paris, 1824; English translation, London, 1862); Lower, "English Surnames" (London, 1842); Pott, *Die Personennamen* (Leipsic, 1853); and Ferguson, "English Surnames" (London, 1858), *Patronymica Britannica* (1860), and "The Teutonic Name System" (1864).

NAMUR. I. A province of Belgium, bounded N. by Brabant, N. E. by Liège, E. by Luxembourg, S. by France, and W. by Hainaut; area, 1,413 sq. m.; pop. in 1872, 314,718. The principal rivers are the Meuse, Sambre, and Lesse. The surface is very much diversified, and the soil is in general fertile. Iron, lead,

coal, and marble are mined. The province is divided into the arrondissements of Namur, Dinant, and Philippeville. II. A city, capital of the province, at the confluence of the Sam-

Namur.

bre and Meuse, 35 m. S. E. of Brussels; pop. in 1871, 25,600. It is the seat of a bishop, and has a cathedral, 16 other churches, a theological seminary, a royal Athenæum, an academy of design, a conservatory of music, and two museums. The cathedral, a modern structure, is ornamented in front with 20 Corinthian columns, and beside the great altar stand colossal statues of the apostles Peter and Paul. The staple manufactures are cutlery, for which Namur is famous, and leather, which gives employment to one tenth of the population. The town was taken by Louis XIV. in 1692, and by William III. of England in 1695. The emperor Joseph II. demolished its fortifications, which in 1817 were restored by the king of the Netherlands; but they were again demolished, except the citadel, in 1866.

NANA SAHIB, the title of Dhundoo Punt, a Hindoo chieftain and a leader of the sepoy mutiny in 1857, born in 1824 or 1825. He was the son of a Brahman of the Deccan, and when a little more than a year old was brought to Bithoor, where Bajee Row, the peishwa or chief of the Mahrattas, adopted him. On the death of Bajee in 1851, without heir of his body, an estate in the neighborhood which had been bestowed upon him by the British during pleasure was declared lapsed to the East India company, as they had previously refused to recognize inheritance of lands by adoption, and a pension of \$450,000 a year granted to him and his family in 1818 was also stopped. The Nana sent an agent to England

to advocate his claims, but without success, and this supposed wrong he never forgave. He lived however in great apparent friendship with the English, imitating their customs as far as he could, and was permitted to occupy the town of Bithoor, where he possessed much wealth and influence. When the sepoy mutiny broke out in 1857, he was universally trusted by the English, who applied to him for a body of soldiers to guard the treasury at Cawnpore, which he immediately granted; but no sooner had the insurrection occurred at the latter place than he put himself at the head of the rebels (June 5), and killed all the Europeans that fell into his hands, among whom were two large parties, principally of women and children, who were endeavoring to escape down the Ganges from Futtehghurh. The English at Cawnpore in the mean time defended themselves until June 27, when they surrendered on the Nana promising to send them safe to Allahabad. They were permitted to embark, but immediately afterward fired upon, many being killed and the rest brought back to land. The men were put to death at once; the women and children, after surviving nameless outrages, were massacred July 15, the day before Havelock arrived at Cawnpore, and their bodies were thrown into a well. The Nana retreated to Bithoor on the 17th, whither Havelock pursued him, driving him out of the town and dispersing his army. He soon collected another force, with which he followed Havelock into Oude, but afterward returned toward Cawnpore with the intention of attacking Gen. Neill, who was in garrison there with a small force. Reoccupying Bithoor, he threw out his left wing in the direction of Cawnpore, but it was driven back in confusion by Gen. Neill, Aug. 15; and on the next day Havelock, who had returned from Oude, defeated his whole force in a sharp engagement. Owing to the exhaustion of the victors and their want of cavalry, the Nana escaped, and, without coming directly in contact with the British, except once more at Cawnpore, where Sir Colin Campbell defeated him, Dec. 6, he continued an active and harassing warfare. On the occupation of Gwalior by the rebels in June, 1858, he was chosen peishwa of the Mahrattas, and his nephew Row Sahib was placed in command of the city. His subsequent career it is difficult to trace, for his energies were bent rather upon escaping pursuit than conducting offensive operations. Long after the other leaders had submitted or been captured, he continued, with the begum of Oude and about 10,000 rebels, to infest the northern parts of central India and the frontiers of Nepaul. There was a report that he died of fever in the latter part of 1859, but it was generally discredited; another that he crossed the Himalaya in disguise in 1860 into Thibet, and encamped near the N. base of the mountains with about 10,000 men. In November, 1874, a man was arrested in the north of India, supposed to be Nana Sahib.

Great excitement was caused by the arrest, and he was taken to Cawnpore for identification; the result of such inquiry is not yet known (January, 1875).

NANCY, a city of France, capital of the department of Meurthe-et-Moselle on the left bank of the river Meurthe, 170 m. E. of Paris; pop. in 1872, 52,978. It stands in a beautiful and fertile plain, and consists of an old and a new town. The many fine edifices, squares, and promenades render Nancy one of the handsomest of French cities. It is the seat of a bishop, and has faculties of law, medicine, sciences and literature, a lyceum, a school of forestry, 8 Catholic churches, 6 religious communities of men and 15 of women, and a number of learned societies. The chief edifices are the cathedral, a handsome modern structure, with two towers more than 250 ft. high; the church of St. Epvre, which contains several fine paintings, and a fresco attributed to Leonardo da Vinci; the church of the Cordeliers, in which is the mausoleum of the dukes of Lorraine; an ancient Gothic castle, which was nearly destroyed by fire on the withdrawal of the German troops in July, 1871; the museum, with pictures by Isabey, a native of Nancy, and other works of art; and hospitals. Hosiery, muslin, cotton yarn, woollen cloth, calico, lace, &c., are manufactured. There are three fairs yearly, one of which lasts 20 days.—Nancy was the capital of the duchy of Lorraine from the 13th century till its absorption by France; and under its walls Charles the Bold, duke of Burgundy, was defeated and slain, Jan. 5, 1477, by René II., duke of Lorraine.

NANDOU. See OSTRICH.

◆**NANKING**, or Nankin (*i. e.*, the “southern capital,” in distinction from Peking, the “northern capital”), called also KIANGNING-FU, a city of China, the chief town of the province of Kiangsu, and the residence of the governor general of the three provinces of Kiangsu, Nganhwui, and Kiangsi, about 3 m. S. of the Yangtse-kiang river, about 200 m. from its mouth, 560 m. S. by E. of Peking, and on the grand canal connecting Canton and Peking, in lat. 32° 2' N., lon. 118° 49' E.; pop. estimated before the Taiping rebellion at 400,000 or more, but now probably much less. The river opposite the city is 1½ m. broad and 25 fathoms deep, with a rocky bottom, and a current of from 3 to 5 m. an hour. The region about the city is very marshy, and the excessive moisture makes it unhealthy for Europeans and natives of other provinces. The remains of ancient walls have been traced for a circuit of about 35 m. The modern walls are about 40 ft. high and 18 m. in circumference, and enclose a space of which not more than one eighth is occupied by the town. On the W. side they are strengthened by a deep ditch from the river. The great extent of the walls makes them difficult to defend, and the city is overlooked by the hills on the east. The eastern part of the city is irregular and thinly inhabit-

ed, but in other parts the houses are so closely packed that one looking from a high building over the tent-like roofs of the temples can scarcely trace the streets. The Mantchoo and Chinese parts are separated by a cross wall. The principal streets are of moderate width, and were formerly lined with handsome shops. Most of the buildings of former note have been destroyed. There is a curious square tower 50 ft. high, on the top of which is a finely sculptured figure of a turtle, carved from a single block of marble. Not far from the walls is an ancient cemetery, which travellers have called the tombs of the kings, approached

Porcelain Tower (destroyed by the Taipings).

by an avenue of colossal figures. At some distance from these statues are rude colossi of horses, elephants, and other animals, without regular arrangement, and perhaps removed from their original places. The celebrated porcelain tower was destroyed by the rebels. It was built in 1413-'32, and was of an octagonal form, 260 ft. high, in nine stories, each adorned with a cornice and gallery, and covered with a roof of green tiles, with a bell suspended at each corner, which sounded when moved by the wind. On the top was a pinnacle in the shape of a pineapple, surmounted by a gilded ball. A spiral staircase led to the summit.—Before the accession of the Mongol dynasty the court sometimes resided at Nanking. The first

two emperors of the Ming dynasty also resided in it. It was taken by the Mantchoos in 1645, and continued to be a very important city, famous for various manufactures, especially for the cloth called from it nankeen. It was invested by Sir H. Pottinger Aug. 14, 1842, and the treaty with England was signed there Aug. 26. It was taken March 19, 1853, by the Taiping rebels, who tried to establish there the ancient "heavenly empire." They held it for 11 years. During this occupation a collision with the British ships under Lord Elgin led to a bombardment of the city, which ruined the Chinese batteries. On July 19, 1864, it was taken by the imperialists, who sprung a mine of 68,000 lbs. of gunpowder under the wall, and entered through the breach. They found the rebel emperor dead by suicide, with most of his higher officials. More than £2,000,000 of treasure was found concealed in the palace. Since the imperialist occupation there has been some attempt to restore the former manufactures, but with little success. The governor general has established a manufactory of shot and shell. The business part of the city is being gradually restored. There is little or no foreign trade; and though the city is a free port, few foreigners reside there.

NANSEMOND, a S. E. county of Virginia, bordering on North Carolina and the Dismal Swamp, and drained by branches of the Nansemond river; area, 444 sq. m.; pop. in 1870, 11,576, of whom 5,517 were colored. It has a level surface and sandy soil. Lumber, tar, and turpentine are exported in considerable quantities. The Seaboard and Roanoke, and the Atlantic, Mississippi, and Ohio railroads pass through it. The chief productions in 1870 were 5,405 bushels of wheat, 228,057 of Indian corn, 22,466 of oats, 22,169 of Irish and 57,594 of sweet potatoes. There were 1,017 horses, 1,392 milch cows, 2,192 other cattle, 1,381 sheep, and 11,044 swine. Capital, Suffolk.

NANTASKET, a narrow peninsula about 5 m. long, extending into Massachusetts bay, in Plymouth co., Mass., about 22 m. from Boston by railroad and 9 m. by water. It is a favorite summer resort on account of its facilities for sea bathing. This peninsula comprises the town of Hull, which was settled about 1625; pop. in 1870, 261. (See COHASSET.)

NANTERRE, a town of France, in the department of the Seine, at the foot of Mont Valé-

rien, 6 m. W. N. W. of Paris; pop. about 4,000. It is celebrated as the birthplace of St. Genevieve, and also for its pastry. It is a place of great antiquity, and the Gauls here celebrated druidical rites. It was formerly fortified, but the ramparts have been converted into promenades. Clotaire II., son of Chilperic, was baptized here in 591. In the 14th and 15th centuries it endured many vicissitudes.

NANTES (anc. *Condivicnum*), a city of France, capital of the department of Loire-Inférieure, on the right bank of the Loire, at its junction with the Erdre, 210 m. W. S. W. of Paris; pop. in 1872, 118,517. The old town W. of the Erdre was walled until the end of the 17th century. In the new quarter the houses are handsomely built of white stone, although the streets are narrow. There are however some fine boulevards, and the quays extending for nearly 2 m. along the Loire and Erdre formerly composed a famous promenade, lined with

Nantes Castle and Cathedral.

trees, which have been sacrificed to the railway. The cathedral of St. Pierre, built in the 15th century, is unsightly externally, the towers scarcely rising above the roof, but has a finely sculptured triple portal, and contains the mausoleum of the last duke of Brittany and his duchess. The castle is an irregular Gothic pile flanked with round towers. Its chapel was used as a powder magazine, and was blown up in 1800, destroying much of the building. In this castle Henry IV. signed the edict of Nantes, April 13, 1598, which secured liberty of religion to the French Protestants, until its revocation by Louis XIV., Oct. 22, 1685. In 1654 it was the prison of the cardinal de Retz. Most of the kings of France from Charles VIII. have resided in it at some time. The museum contains more than 1,000 paintings and 300 sculptures. The building docks are of great extent, and one fourth of the trading vessels of France are built at Nantes. The most im-

portant industry is sugar refining, and there are considerable cotton and woollen manufactories. The town communicates by canal with Brest. It has a large foreign and internal trade, and much wheat and flour is exported to England.—Nantes was the stronghold of the ancient Nannetes. In the middle ages it was the capital of the duchy of Brittany. It was three times taken by the Normans and nearly ruined. During the English wars in France it fell repeatedly into the hands of the opposite parties. During the revolution, it was unsuccessfully besieged by the Vendean army in 1793, and subsequently was the scene of the *noyades* and "republican marriages." (See CARRIER.)

NANTEUIL, Célestin, a French artist, born in Rome in 1813, died in Paris in 1873. He studied under Langlois and Ingres, and exhibited his first work, a "Holy Family," in 1833, followed by "A Beggar" (1834), and "Christ Healing the Sick" (1837). But he was mainly employed as a lithographer, and in the course of about 30 years executed more than 2,000 vignettes for literary and musical publications. Among his more recent paintings are "The Temptation" (1851), "The Vine" (1853), "Souvenirs of the Past" and "The Kiss of Judas" (1858), the latter after Van Dyck, of which he also produced an admirable engraving.

NANTUCKET, a town and county of Massachusetts, coextensive with each other, comprising the island of Nantucket, the islets of Tuckernuck and Muskeget, and the Gravelly and Swyle islands adjacent to it on the west; aggregate area, 48 sq. m.; pop. in 1775, 4,500; in 1840, 9,012; in 1860, 6,094; in 1870, 4,123. Nantucket island is situated in the Atlantic ocean, 18 m. S. of Cape Cod, 85 m. S. E. of Boston, and is separated from Martha's Vineyard on the west by a channel 8 m. wide. It is of an irregular triangular form, about 16 m. long from E. to W., and for the most part from 3 to 4 m. wide, with an area of about 45 sq. m. It has a level surface in the south, and is slightly hilly in the north. The soil is light, and with the exception of some low pines the island is treeless. There are several ponds containing fine fish. Farming and fishing are the chief occupations of the people, the surrounding waters abounding in fish of various kinds. The climate is mild in winter and cool in summer, and the island is becoming a favorite summer resort. It constitutes a customs district, but has little commerce. There is a lighthouse on Sankaty head (lat. 41° 17' N., lon. 69° 57' 35" W.), near the S. E. extremity of the island; another, known as Nantucket light, on Sandy or Great point (lat. 41° 23' 22", lon. 70° 2' 25"), at the N. E. extremity; and several W. of the entrance to Nantucket harbor. Wrecks are not infrequent. Nantucket shoals, about 50 m. long and 45 m. wide, are S. E. of the island, and are dangerous to navigation. There are two post villages, Nantucket on the N. side of the island, and Siasconset on the S. E. Nantucket har-

bor is deep and secure, though the entrance is obstructed by a bar with only 7½ ft. of water at low tide. Steamers run daily to Wood's Hole on Cape Cod, connecting with railroad for Boston. The town contains a national bank, with a capital of \$200,000; a savings bank; five public halls, including the town hall; several public schools; a semi-weekly and a weekly newspaper; and nine churches, viz.: Baptist (2), Congregational, Episcopal, Friends' (2), Methodist, Roman Catholic, and Unitarian. The Coffin school is an incorporated endowed institution, including a grammar and a high school department. The Athenæum has a library of 4,000 volumes, and there is a circulating library.—Nantucket was first settled in 1659 by Thomas Macy, who emigrated from Salisbury, Mass. It was then partially wooded with oaks and other deciduous trees and conifers; but the destruction of the trees ultimately made the island almost a desert. It was included in the grant to the Plymouth company in 1620, in 1664 annexed to New York, and in 1693 ceded to Massachusetts. The town was incorporated as Sherburne in 1673, and in 1795 the name was changed to Nantucket. When it was first settled there were about 1,500 Indians on the island. They decreased to 358 in 1763, in which year a pestilence carried off 222 of them. The last one of full blood died in 1821, and the last half-breed in 1854. Nantucket has been chiefly noted as a seat of the whale fishery, having been at one time the chief whaling port in the world. The fishery from the shore commenced about 1670, and was continued till 1760. The first sperm whale was captured in 1712, and immediately after small vessels were fitted out for short cruises. The size of the vessels and the length of the cruises were gradually increased, until in 1775 150 vessels were engaged in the business, extending their voyages as far as Davis strait and the coast of Brazil. The war of the revolution destroyed this business, but after its close it was revived. The first ship was despatched to the Pacific in 1791. The town increased in size and prosperity till 1846, when it was visited by a severe conflagration, destroying property to the value of nearly \$1,000,000. After this the whale fishery and with it the prosperity of the town rapidly declined. The fishery began to revive before the breaking out of the civil war, but afterward became extinct. (See WHALE FISHERY.)

NAPA, a N. W. county of California, drained by Napa and Las Putas rivers; area, 828 sq. m.; pop. in 1870, 7,163, of whom 263 were Chinese. The surface is diversified, but generally fertile and well adapted for cultivation. The Coast range of mountains extends along the S. W. border, and Mount St. Helena, at the head of the Napa valley, attains an elevation of 3,700 ft. It contains numerous medicinal springs, constantly increasing deposits of sulphur, two lakes yielding large quantities of borax, geysers or hot springs about 60 m. N.

of Napa City, and quicksilver. The Napa branch of the California Pacific railroad traverses it. The chief productions in 1870 were 264,240 bushels of wheat, 34,890 of barley, 20,789 lbs. of wool, 56,860 of butter, 46,745 gallons of wine, and 4,555 tons of hay. There were 1,755 horses, 1,128 milch cows, 2,703 other cattle, 6,006 sheep, and 6,243 swine. Capital, Napa City.

NAPHTALI, the sixth son of Jacob, the second child borne to him by Bilhah, the handmaid of Rachel. In the census before Sinai the tribe of Naphtali numbered 53,400 fighting men, and at the entrance into Canaan 45,400, occupying a middle position among the tribes. It received as its allotment a part of upper Galilee, extending from Lake Gennesaret to the sources of the Jordan. The only famous hero of the tribe was Barak. It is distinguished in the song of Deborah for the alacrity with which it obeyed the call to arms against the oppressors of the Hebrews. The principal town in its territory was Kadesh, the city of refuge.

NAPHTHA, a term originally applied to a variety of pungent, volatile, inflammable liquids, chiefly belonging to the class of ethers; it was then extended to oils of natural origin, rock oil, petroleum, &c. Subsequently the light oil of coal tar, owing to its resemblance to mineral oil, was termed naphtha; more recently it has been again extended so as to include most of the inflammable liquids produced by the dry distillation of organic substances. In the United States it is applied to a series of hydrocarbons obtained from petroleum, and having specific gravities ranging from 0.625 (rhigolene) to 0.742, and boiling points varying with the densities from 65° to 300° F. The following are some of the naphthas known in commerce: 1, boghead naphtha, obtained by distilling the Torbane hill mineral or boghead coal at as low a temperature as possible; 2, bone naphtha, Dippel's animal oil; 3, coal naphtha, obtained by the distillation of coal tar, and often confounded with benzole; 4, mineral naphtha, from petroleum. According to S. Dana Hayes, the petroleum naphthas have distinguishing characteristics by which they are easily recognized, and which place them in a class by themselves; and aside from their odors, densities, boiling points, volatilities, and solvent powers, a noticeable peculiarity is the absence of oily bodies; they do not leave any permanent stain on common writing paper, as do all the heavier oils obtained from petroleum. The commercial products are:

	Specific gravity.	Beaumé scale.	Boiling point.
C. Naphtha.....	0.706	70	150° F.
B. Naphtha.....	0.724	67	220° "
A. Naphtha.....	0.742	65	300° "

5. Wood naphtha, pyroligneous ether, pyroxylic spirit, or methylic alcohol, is a colorless, mobile, indifferent, inflammable liquid, which

burns with a faintly illuminating, bluish flame; it is miscible in all proportions with water, alcohol, ether, and ethereal oils; specific gravity 0.796, boiling point 149° F. When pure it has been prescribed in medicine for diseases of the lungs, and owing to its cheapness it is often substituted for alcohol, and sometimes used to adulterate brandy.—As commonly described, naphtha is a very inflammable colorless liquid, of bituminous odor, tasteless, soluble in all proportions in absolute alcohol and in ether, insoluble in water, of specific gravity 0.700 to 0.847. It dissolves the fixed and essential oils in all proportions, and is hence advantageously used for removing grease from fabrics, and for the extraction of oils from seeds. It also dissolves sulphur, phosphorus, iodine, gum lac and copal, camphor, caoutchouc, the resins, &c.; a quality that adapts it for the preparation of varnishes, and for other similar uses in the arts. In its preparation from artificial coal oils it is found that those which produce paraffine yield in general naphtha, while the product of those which contain naphthaline is rather limited to the hydrocarbons of the benzole series. It is manufactured into gas, is used to increase the illuminating power of coal gas in the place of benzole, and is sold for combustion in gas stoves and in lamps. There is probably no chemical product which has occasioned the loss of so many lives and the destruction of so much property as naphtha. Since its cheap manufacture as an incidental product in the distillation of petroleum, it has been thrown upon the market in enormous quantities, and owing to its cheapness has been mixed with petroleum or sold under a great variety of names for heating and illuminating purposes; and from its highly explosive and inflammable nature, it has proved little better in the hands of ignorant people than so much gunpowder. Its sale is now everywhere prohibited except for legitimate purposes.

NAPHTHALINE ($C_{10}H_8$), a hydrocarbon obtained from the distillation of numerous organic bodies, such as coal, wood, resin, oils, and animal substances; also by conducting the vapor of acetic acid, alcohol, ether, volatile oils, and camphor through red-hot tubes. It has been prepared by the passage through hot tubes of ethylene, marsh gas, and other hydrocarbons, as well as of a mixture of benzole and ethylene, sulphuretted hydrogen and disulphide of carbon, hydrogen, and the vapors of chloride of carbon. In general we can say that naphthaline is the product of the decomposition of organic matter at a red heat, just as the oxidation of the same bodies yields oxalic acid. Warren and Storer found naphthaline as a native product in the petroleum of Burmah. It was first noticed by Garden in 1820, was observed about the same time by Reichenbach, and fully analyzed and its true chemical composition determined by Faraday. The most laborious researches upon it were made by Laurent, who was engaged for 20 years in the

study of the substitution products of this interesting body.—The raw material usually employed in the preparation of naphthaline is coal tar, and the method recommended by Vohl is as follows: The dead oil is run into vats, and left in a cool place for six to eight days, when crystals of naphthaline are formed. The liquid portion is then drawn off, the crystalline mass stirred up to a pap by a pestle, the adhering oil removed in a centrifugal machine, and the mass finally placed under a hydraulic press. The press cake is then transferred to an iron vessel provided with a steam coil and a stirrer, so arranged that it can be operated when the vessel is closed. The fused mass is then well mixed with a few per cent. of caustic soda, the lye run off, and the operation repeated three times, and finally washed with hot water until no further reaction can be perceived. In this manner all of the carbofic acid, creosote, resinous matter, and other impurities are removed. The still fluid naphthaline is then intimately mixed with a few per cent. of sulphuric acid of 45° B., the acid let off, washed out with water, and the contents of the vessel agitated with strong caustic soda and left for two or three hours to subside, at a temperature of 100° C. The naphthaline thus treated is further purified by distillation over a free fire from cast-iron stills capable of holding a ton. At first naphthaline mixed with water passes over, but at 210° C. pure naphthaline distils, and so rapidly that 100 lbs. can be obtained in 20 minutes. The naphthaline vapors are condensed in water at 80° C. in closed vessels placed in water baths, also kept at 80°. The pure naphthaline obtained in this way is run into conical glass, metal, or moistened wooden moulds, from the sides of which it separates by contraction on cooling, and is introduced into commerce in sticks like brimstone. Naphthaline, when pure, has the form of brilliant white, scaly, rhombic plates of peculiar odor, having a specific gravity of 1.151, according to Vohl; a melting point, according to Kopp, of 79.2° C.; and a boiling point of 216.4° to 216.8° C. It is in small quantities volatile at lower temperatures, and goes over copiously with steam. It possesses at first a weak, subsequently a burning taste; is insoluble in cold, very slightly in hot water; easily soluble in warm alcohol, ether, benzole, turpentine, volatile and fatty oils, and in acetic and oxalic acids. According to Vohl, the fused naphthaline absorbs air in the same manner as molten silver, which is richer in oxygen than the atmosphere, and gives it up again on cooling. Naphthaline dissolves indigo, phosphorus, sulphur, succinic, benzoic, and oxalic acids, chloride of mercury, and the sulphides of arsenic, tin, and antimony, which on cooling usually separate in a crystalline condition. Caustic potash and dilute sulphuric acid do not act on naphthaline, but chlorine, bromine, nitric acid, and concentrated sulphuric acid readily attack it. It crackles in

the hand like sulphur, and becomes negatively electric when rubbed with silk. It is destructive to moths, and is used as a substitute for camphor in the protection of woollens, plants, and objects of natural history. When burned in its pure state it gives rise to copious clouds of fine lampblack.—The researches of Laurent have shown the existence of a numerous series of substitution compounds, in which chlorine and bromine take the place of the hydrogen element, and sometimes replace each other. The bodies so formed are not of much practical importance, but their investigation has had a remarkable influence upon the recent progress of organic chemistry. A table of a few of these compounds will serve to illustrate the manner of substitution:

Naphthaline.....	C ₁₀ H ₈
Chlonaphthase.....	C ₁₀ H ₇ Cl
Bronaphthase.....	C ₁₀ H ₇ Br
Chloraphthase.....	C ₁₀ H ₆ Cl ₂
Bronaphthase.....	C ₁₀ H ₆ Br ₂
Chlonaphthase.....	C ₁₀ H ₅ Cl ₃
Bronaphthase.....	C ₁₀ H ₅ Br ₃
Chlorobronaphthase.....	C ₁₀ H ₄ Cl ₂ Br
Chlonaphthase.....	C ₁₀ H ₄ Cl ₄
Chlorobronaphthase.....	C ₁₀ H ₄ Cl ₃ Br ₂
Chloribronaphthase.....	C ₁₀ H ₄ Cl ₃ Br
Bronaphthase.....	C ₁₀ H ₄ Br ₄
Bromechlonaphthase.....	C ₁₀ H ₃ Br ₂ Cl ₃
Chlonaphthase.....	C ₁₀ H ₃ Cl ₆
Chlonaphthase.....	C ₁₀ Cl ₈

—Naphthalic or phthalic acid, made by the oxidation of naphthaline by sulphuric acid and black oxide of manganese, can be converted into benzoic acid, benzole, nitro-benzole, and finally into aniline; and in this way naphthaline is one of the sources of aniline colors. Magdala red is a dye prepared by the action of nitrous acid on naphthylamine, which in turn is derived from naphthaline. Naphthaline yellow is made by digesting 100 parts of naphthaline for a few hours in a mixture of 200 parts of water and 20 parts of nitric acid, and dissolving the resulting crystals in ammoniacal water. Kopp's brown is produced by boiling nitro-naphthaline with sulphuric acid. Other compounds are naphthazarine, similar to alizarine, called also dianthine; naphthylamine, one of the most interesting; Perkins's violet; naphthaline alcohol, or naphthole; Hoffmann's naphthaline red; naphthyl-rosaniline; and numerous others.

NAPIER, Sir Charles, a British admiral, born at Merchiston hall, Stirlingshire, March 6, 1786, died Nov. 6, 1860. He was a grandson of the fifth Lord Napier and a descendant of the inventor of logarithms. He entered the navy in 1799; in 1805 was appointed lieutenant; in 1808 commanded the brig Recruit of 18 guns; and in April, 1809, for gallant service against the French, was made a post captain. He subsequently served with the army in Portugal; and between November, 1811, and June, 1815, he participated in numerous exploits on the coast of southern Italy and the North American station. After a long period of inactivity he was in 1829 employed in special service on the coast of Portugal, and in 1838

was appointed by Dom Pedro to command the Portuguese fleet destined to operate against Dom Miguel. On July 5, 1833, he gained a signal victory off Cape St. Vincent, and was created Viscount Cape St. Vincent, grand cross of the tower and sword, and a grandee of the first class in Portugal. In 1839 he re-entered the English navy, and in 1840 became commodore under Admiral Stopford of the fleet employed on the coast of Syria, where he participated in the storming of Sidon and the capture of Beyrout and Acre. In the same year he was created a K. C. B., besides receiving several continental decorations; and in 1846 he was appointed rear admiral of the blue, and given command of the channel fleet. In 1849 he was superseded, but upon the breaking out of war with Russia he was put in command of the fleet destined to act against Cronstadt and other Russian ports in the Baltic, with the rank of vice admiral of the blue. He sailed from Spithead, March 11, 1854, with the most magnificent fleet ever equipped by Great Britain, promising to take Cronstadt in a month. His return to England in December, without having accomplished anything of importance beyond the capture of Bomarsund, subjected him to considerable ridicule, and led to recriminations between himself and the ministry. In 1858 he was made admiral of the blue. He was member of parliament for Marylebone from 1841 to 1847, and after 1855 for Southwark. He published a series of letters on naval reform, and in 1851 "The Navy, its Past and Present State." He also wrote "Account of the War in Portugal" (2 vols., 1836), and "The War in Syria" (2 vols., 1842). A "History of the Baltic Campaign of 1854" was prepared from materials furnished by him (1857). His "Life and Correspondence" was published by Maj. Gen. E. Napier (2 vols., 1862).

NAPIER, Sir Charles James, a British soldier, cousin of the preceding, born in Whitehall, London, Aug. 10, 1782, died at Oaklands, near Portsmouth, Aug. 29, 1853. At an early age he received an ensign's commission in the 4th regiment of foot, with which he served during the Irish rebellion of 1798, and again in 1803. He commanded the 50th regiment of foot in the retreat of Sir John Moore, and in the battle of Corunna (Jan. 16, 1809) received five severe wounds, and was left for dead in the hands of the enemy. He returned to England on parole some months later, to the astonishment of his friends, who had already administered upon his estate. Before procuring employment he occupied his leisure by writing pamphlets on a variety of subjects. He finally went to the Peninsula as a volunteer, had two horses shot under him at Coa, and was severely wounded at Busaco. In 1811 he procured a regular command, and served until the close of the war. Immediately afterward he was sent to Bermuda as lieutenant colonel of the 102d regiment, and for some months participated in expeditions which harassed the

coast of the United States. The return of Napoleon to France recalled him to Europe, but he arrived too late to participate in the battle of Waterloo. In 1824 he was appointed governor of Cephalonia, where he remained five years, and was active in promoting the cause of Greek independence. After a long period of inactivity, he was appointed commander of the forces in the northern district of England, whence in 1841 he was transferred to the command of the army in Bombay. He commenced his Indian career by a number of sweeping reforms in the service, which gained him the dislike of his officers. Upon the arrival of Lord Ellenborough in India in February, 1842, as governor general, Napier sketched out for him the plan of a second Afghan campaign; and in the early part of the succeeding year he took the field against the ameers of Sind. He made a rapid march across a desert to the fortress of Emaun Ghur, one of the chief strongholds and magazines of the ameers, which he blew up. On Feb. 17, 1843, with a force of less than 2,000 men, he overcame an army of 35,000 Belooches at Meeanee, compelling the surrender of the important fortress of Hyderabad. On March 24 he defeated Shere Mohammed, who had collected an army of about 25,000 men at Dubba, near Hyderabad. The war being ended, Napier set to work to improve the condition of the conquered province, of which he had been appointed governor. He protected the Hindoo and Sindian population, who had long been subjected to the military despotism of the Belooches, encouraged native industry, and abolished slavery and the slave trade, sutteeism, infanticide, the military tenure of lands, and other barbarous customs. At the breaking out of the first Sikh war in 1845 he organized a force of 15,000 men to operate against the enemy, but was ordered elsewhere before the commencement of the campaign. In 1847 he returned to England. In March, 1849, he was again sent to India, as commander-in-chief of the British forces in the second Sikh war, superseding Lord Gough. He found the war virtually ended before his arrival, and coming into collision with the governor general, Lord Dalhousie, on some points of prerogative, he returned to England in 1850. His health rapidly failed after this, his last public appearance being at the funeral of the duke of Wellington in November, 1852. Among his numerous publications those of most permanent importance are: "Lights and Shadows of Military Life" (1840), a free imitation of Alfred de Vigny's *Grandeur et servitude militaire*; "History of the Colonies: Ionian Islands" (1853); and "Indian Misgovernment and Lord Dalhousie" (1853). His career in India has been described by his brother Sir William F. P. Napier, who also published his "Life and Opinions" (4 vols., London, 1857). Monuments to him have been placed in Trafalgar square and St. Paul's church, London.

NAPIER, Henry Edward, an English author, born March 5, 1789, died Oct. 13, 1853. He was the youngest brother of Sir Charles James Napier, and was a captain in the navy. He is the author of "Florentine History from the earliest Authentic Records to the Accession of Ferdinand III., Grand Duke of Tuscany" (6 vols. 12mo, London, 1846-'7).

NAPIER, John, laird of Merchiston, the inventor of logarithms, born at Merchiston castle, near Edinburgh, in 1550, died there, April 4, 1617. In 1562 he entered St. Salvator's college in the university of St. Andrews, and subsequently passed several years in travelling in France, Italy, and Spain. On his return to his native country he did not mingle in active life, and but little is known of him until he had arrived at the age of 40. In 1593 he published "A Plain Discovery of the Revelation of St. John" (4to, Edinburgh), and in the dedication gave King James some advice in regard to religious matters, and the propriety of reformation in his own "house, family, and court." A letter of his to Anthony Bacon, concerning secret inventions for national defence, written in 1596, still exists in the archbishop's library, Lambeth. One of these was for a burning mirror to set fire to ships by reflecting the rays of the sun; another was a device to accomplish the same purpose by reflecting "the beams of any material fire or flame;" another an instrument which should scatter such an amount of shot in all quarters as to destroy everything near it. Nothing is heard of him after this until in 1614 he brought out his system of logarithms, entitled *Mirifici Logarithmorum Canonis Descriptio* (4to, Edinburgh). Although published then, it is evident that Napier had begun the investigation of this subject before 1594, from a letter written by Kepler to Crugerus in 1624, in which he says: *Nihil autem Nepierianam rationem esse puto; etsi Scotus quidem literis ad Tychonem, anno 1594, scriptis jam spem fecit canonis illius mirifici*. No sooner was the work published than Henry Briggs, then professor of mathematics in Gresham college, London, began the application of the rules in his *Imitatio Nepiereæ*, and the system proposed by him is now commonly used. Napier's last work was his *Rabdologia seu Numerationis per Virgulas Libri duo* (12mo, Edinburgh, 1617), in which he explained a contrivance to facilitate multiplication and division by means of small rods, which invention goes under the name of Napier's bones. After his death was published his *Mirifici Logarithmorum Canonis Constructio* (12mo, 1619), in which he explained the principle of the construction of logarithms. Napier also enriched the science of trigonometry by the general theorem for the resolution of all the cases of right-angled spherical triangles. There are two lives of Napier: one by the earl of Buchan, with an analysis of his works by Dr. Walter Minto (1787), and another by Mark Napier (1834).

NAPIER, Macvey, a Scottish writer, born in 1776, died in Edinburgh, Feb. 11, 1847. He studied law, was chosen librarian of the society of writers for the signet, and in 1825 was selected for a lectureship on conveyancing, which was soon afterward made a professorship in the university of Edinburgh, a post which he occupied till his death. In 1817 he published an essay on the writings of Lord Bacon, which was subsequently incorporated with a work entitled "Lord Bacon and Sir Walter Raleigh" (8vo, Cambridge, 1853). He edited the "Supplement to the Encyclopædia Britannica" (6 vols. 4to, Edinburgh, 1815-'24), and afterward superintended the seventh edition of the entire work (1830-'42), to which he contributed many important articles. He succeeded Mr. Jeffrey as editor of the "Edinburgh Review" in 1829, and conducted it for 17 years. In 1837 he resigned his office of librarian, being made one of the principal clerks of the court of session.

NAPIER, Robert, a Scottish engineer, born in Dumbarton, June 18, 1791. The son of a blacksmith, he preferred serving an apprenticeship to that trade to going to college. In 1811 he went to Edinburgh, but had little success, and afterward to Glasgow, where he was employed a short time with Mr. W. Lang, who manufactured jacks and machinery for calendar works. In 1815 he purchased with the help of his father a blacksmith's establishment at the Gallowgate of Glasgow, and set up business for himself. In 1823 he constructed his first marine engine, the forerunner of a large number of works of a similar character. In 1830, in conjunction with the city of Glasgow steam packet company, he established a line of vessels which remained unsurpassed till superseded by railways. In 1834 he furnished the Dundee and London shipping company with the Dundee and Perth steamships; in 1836 the East India company with the *Berenice*; and, in addition to several other works, in 1840 supplied Samuel Cunard with his first four steamers. He built in 1856 the iron steamship *Persia*, of 3,600 tons. In 1859 the firm of Robert Napier and son undertook the construction for the British navy of the *Black Prince*, of 6,100 tons, in 1860 of the *Hector*, of 4,060 tons; and they have constructed steam rams and iron-clad ships of war for foreign governments. Mr. Napier received the great gold medal of honor at the Paris exposition of 1855, and the decoration of the legion of honor.

NAPIER, Sir William Francis Patrick, a British author, brother of Sir Charles James Napier, born in Castletown, county Kildare, Ireland, in 1785, died at Clapham Park, near London, Feb. 12, 1860. He entered the army at 15 years of age, and became a captain in 1804. After serving in the expedition to Copenhagen in 1807, he accompanied Sir John Moore to Portugal in 1808, and during the next six years was an active participant in the peninsular

war. In 1811 he became major and in 1813 lieutenant colonel. He was repeatedly wounded during the war, particularly at Almeida, and in following the retreat of Masséna from Portugal in 1811. He became major general in 1841. Between 1842 and 1848 he was lieutenant governor of Guernsey, and in 1848 he was created knight commander of the bath. In 1851 he became lieutenant general, and in 1859 general. He is best known as a writer of military history. His principal work is "The History of the War in the Peninsula and in the South of France from 1807 to 1814" (6 vols., London, 1828-'40). In the preparation of this eminent work he was supplied with materials and documents by the duke of Wellington, Marshal Soult, and other officers, English and French. His wife, a niece of Charles James Fox, deciphered for him the secret correspondence of Joseph Bonaparte. The critical and positive character of this work subjected it to much animadversion, calling out several replies from the author, which were appended to the later editions under the title of "Justificative Pieces." In 1855 he published a volume entitled "English Battles and Sieges in the Peninsula," consisting principally of extracts from his large work, with portions rewritten. He also published "The Conquest of Scinde" (1845), and "The Life and Opinions of the late Sir Charles Napier" (1857).

NAPIER OF MAGDALA, Robert Cornelis Napier, baron, a British general, born in Ceylon, Dec. 6, 1810. His father was a major in the royal artillery, and he was educated in the royal military academy at Addiscombe, and in 1826 entered the Bengal engineers. In the Sutlej campaign of 1845-'6, during which he held the rank of brigade major, he served with distinction, and was severely wounded. He was wounded a second time at the siege of Mooltan, where for some time he acted as chief engineer officer. In 1849 he was made a lieutenant colonel for meritorious conduct at Guzerat. He was engaged in active service throughout the sepoy mutiny, distinguishing himself by the engineering operations which he conducted against Lucknow, and subsequently as a brigade commander, particularly at the siege of Gwalior and the battle of Powree. In 1858 he was made a knight commander of the bath. Two years later he took part in the Anglo-French expedition against China, with the local rank of major general, and achieved special distinction in the operations preceding the capture of Peking. He became a colonel of the royal engineers in 1862; and from 1861 until his appointment to the command of the Bombay army with the local rank of general in 1865, he was a member of the council of the governor general of India. In October, 1867, having been promoted to the full rank of lieutenant general, he was selected by the home government to command the expedition to Abyssinia for the release of the British prisoners held by King Theodore at

Magdala. He landed at Annesley bay on Jan. 7, 1868, and in a brief and brilliant campaign defeated the Abyssinian army, and on April 13 assaulted and captured Magdala, the British prisoners having previously been released. (See **ABYSSINIA**.) For this achievement Sir Robert Napier received the grand cross of the bath, and was raised to the peerage July 17, 1868. In 1870 he was appointed commander-in-chief of the forces in India, with local rank as general, and in this capacity he is a member of the viceroy's council. He has a parliamentary annuity of £2,000 voted in 1868, and has thrice received the thanks of parliament: in 1859, for his services during the Indian mutiny; in 1861, for his skill and intrepidity at Peking; and in 1868, for his conduct of the Abyssinian expedition.

NAPIERVILLE, a S. W. county of Quebec, Canada; area, 152 sq. m.; pop. in 1871, 11,688, of whom 10,815 were of French origin. It is traversed by a division of the Grand Trunk railway. Capital, Napierville.

NAPLES. I. Kingdom of. See **SICILIES**, THE Two. **II.** A province of the kingdom of Italy, bordering on Caserta, Salerno, and the Tyrrhenian sea; area, 412 sq. m.; pop. in 1872, 907,752. It is the most beautiful and most fertile of all the Italian provinces, producing olives and wines of the best quality. The eastern part is mountainous, being traversed by ramifications of the Apennines. The principal rivers are the Sarno and Sebeto. There are many lakes, none of them large; the most important are Lakes Fusaro, Averno, and Lucrino (the Acherusia, Avernus, and Lucrinus of ancient Campania). It is divided into the districts of Casoria, Castellamare di Stabia, Naples, and Pozzuoli.

NAPLES (Ital. *Napoli*; anc. *Neapolis*), the largest city of Italy, in the province of the same name, on the N. coast of the bay of Naples, and on the river Sebeto, in the immediate vicinity of Mt. Vesuvius, and not far from the sites of Herculaneum and Pompeii, 118 m. S. E. of Rome, with which it is connected by railway; lat. 40° 51' N., lon. 14° 15' E.; pop. in 1872, 448,335. The approach to Naples from the sea is famous for its loveliness. The entrance of the bay, from Cape Miceno on the N. W. to Cape Campanella on the S. E., has a width of about 20 m., with a circuit of about 35 m., and an indentation of about 15 m. It is well sheltered, and has good anchorage with seven fathoms of water. At the N. W. entrance are the islands of Ischia and Procida, and at the S. E. the island of Capri, while on the N. shore the city rises in an amphitheatre. On the E. side Mt. Vesuvius is in full view, and numerous towns and villages line the shore. The beauty of the bay has been celebrated by ancient and modern writers, and it is the subject of numerous fine paintings. The city has five principal land entrances, but it is open like London and New York, provided only at the leading avenues

with barriers for the purpose of collecting the *gabelle* or duties on provisions. It retains only a few fragments of its mediæval fortifications. Its three castles and modernized gates are surrounded by streets and houses, and are now within the city. It is divided into two amphitheatre-like crescents by a ridge, running N. and S., which forms the hills of Capodimonte, Sant' Elmo, and Pizzofalcone, terminating on the south in a small island occupied by the *castel dell' Ovo*, and joined by a causeway to the mainland. The crescent E. of this ridge includes the bulk of the population, the most ancient part of the city, and the principal edifices and public institutions, extending E. to the river Sebeto, and intersected from N. to S. by a long thoroughfare, the lower portion of which forms the *strada di Toledo*. On a depression between the Capodimonte and Sant' Elmo hills are the suburbs La Sanità and L'Infrascata, and on the slopes of the former the suburbs Dei Miracoli and Le Vergini. The crescent W. of Sant' Elmo is the modern city, known as the Chiaia or quay, connected with the E. portion by the streets occupying the depression between Sant' Elmo and Pizzofalcone, and by a broad avenue which bears successively the names of Gigante, Santa Lucia, Chiatamone, and Victoria, and which runs along the shore at the foot of Pizzofalcone from the palazzo Reale on the east to the

villa Nazionale, formerly villa Reale, on the west. Another broad street, Riviera di Chiaia, passes along the whole length of the Chiaia; and at its W. extremity are the suburbs of Piedigrotta and Mergellina. The length of Naples, from the Sebeto bridge on the east to the Mergellina suburb on the west, is 4 m.; the breadth, from the Capodimonte hill on the north to the *castel dell' Ovo* on the south, is 2½ m. The streets are generally straight, and paved with square blocks of lava; the large thoroughfares are lighted with gas, but only the principal of them have a sidewalk. The majority of the houses are divided into separate tenements. The ground story consists of a series of arched cells, all of the same shape and size, occupied generally by tradesmen or for cafés or restaurants; and on the upper floors lodge numbers of families. The Neapolitans live much out of doors, and it is nothing unusual to see the children washed and dressed, and other domestic scenes of a more or less delicate nature enacted, in the open street. The *strada di Toledo*, the main artery of Naples, was built in the 16th century by Pedro de Toledo, on what was the western fosse or ditch of mediæval Naples, which it separates from the modern city. It runs N. and S. for about 1½ m., from the end of the *strada di Santa Lucia*, near the royal palace, to the museum, but is hardly 60 ft. in width, while it

Naples.

is bordered by houses five to seven stories high. The *strada del Duomo*, nearly parallel to the Toledo, was commenced in 1870, leading directly to the sea, and promising to be one of the finest streets in the city. Few of the other streets exceed 30 ft. in width, and many

are not above 15 to 20 ft., while some are still narrower. The balconies of most of the houses and the booths and stalls give the streets an appearance of being still more contracted than they really are. The Santa Lucia was rebuilt and enlarged in 1846, and contains one of the

markets for fish, especially for shell fish and oysters, which are in great demand. In January, 1868, a land slide destroyed a number of houses at the foot of Pizzofalcone.—Naples possesses hardly any squares. There are a few public places called until recently *larghi*, but now designated as *piazze*, some of which are decorated with fountains and statuary. Of these the piazza del Mercato is occupied by a great market twice a week. It was the scene of the insurrection of Masaniello. The piazza del Plebiscito, called before 1860 the largo del Palazzo, occupies the site of four monasteries removed in 1810; it contains equestrian statues of Ferdinand IV. (I.) of Bourbon and Charles III., the latter having been originally modelled for a likeness of Napoleon, then altered to Murat, and finally to Charles III. The piazza

del Municipio, formerly the largo del Castello, is the largest in Naples, and contains a celebrated fountain erected by the duke of Medina Celi. The villa Nazionale is the fashionable promenade, and may be said to form part of the Riviera di Chiaia. It is 5,000 ft. long and 200 ft. wide, planted with evergreens, oaks, and acacias. It was laid out in 1780, and enlarged in 1807 and 1834. The early part of it is in the Italian style, and the additions are in the Egyptian, and contain two temples dedicated to Virgil and Tasso, winding paths, grottoes, and a terrace extending into the sea. The sea air proved so injurious to the statuary, that the famous Farnese bull was removed to the museum, and replaced in 1825 by the large granite basin from Paestum which forms the central fountain. Other remarkable statues have also since been taken away, and replaced by mediocre copies of celebrated works of antiquity. The Molo is a favorite resort of the seafaring classes. The popular minstrels, or *cantatori*, who formerly frequented it, have removed to the Marinella, a long open beach, once the resort of the lazzaroni. The latter class has lost its ancient characteristic features, being composed mainly of industrious boatmen and fishermen, though they still preserve their fondness for lying on the beach and basking in the sun.—Prominent among the public buildings of Naples are the castles. The castel Nuovo, with its massive towers and fosses, is situated near the port. The triumphal arch, erected in honor of the entry of Alfonso of Aragon into the city in the 15th century, is remarkable for its classical

style, and stands between two of the old broad and massive Anjou towers. It is entered by bronze gates, sculptured in compartments representing the victories of Ferdinand I.; they are the work of the monk Guglielmo. Within are the barracks and a magnificent hall, now

Castel Nuovo.

used as an armory, but formerly for a royal reception room, and for state festivals. A covered gallery connects the fort with the palace. Adjoining the castle and the royal palace are the dockyard and arsenal. Iron-clad and other vessels of the Italian navy are frequently stationed here. The castel dell' Ovo, in the southernmost part of the city, is of oval form, and defended by bastions and outworks. It was much enlarged by Charles I., and is now chiefly used as a prison. The castel Sant' Elmo, the most commanding point in the city, was built in its present form by Pedro de Toledo, and is said to abound with mines and subterranean passages, which, together with the counterscarp and fosses cut in the solid tufa, and its formidable walls, made it of great strategical importance. It has been dismantled under the new régime, and is used as a military prison. Its ramparts afford a splendid prospect of the city and bay. The castel Capuano was once the residence of the Swabian and occasionally of the Anjou dynasty; it is now the seat of the tribunal of commerce, and of the principal courts of criminal and civil law, and contains a prison on the ground floor, unbaptly celebrated under the Bourbons. The castel del Carmine was fortified after the revolt of Masaniello, when it was the stronghold of the insurgents, and is now used as a military prison and barracks. The *palazzo del municipio* was begun in 1819 and completed in 1825 for the purpose of conducting all the public business in one building. It contains 6 courts, 846 apartments, and 40 corridors, covering 200,000 sq. ft. of ground. There are many fountains, some of

which are highly adorned. The chief aqueduct, which supplies them with water, is the *Acqua di Carmignano*. The *Acqua della Bolla* supplies the lower quarters of the city. The supply is, however, limited. Two artesian wells have been sunk, but without success; and an English firm secured a concession for supplying the city with water in 1873. There are two mineral springs in the city of great celebrity.—The number of churches is over 300. The most important is the cathedral, which retains little of its original Gothic character excepting in the towers. It was commenced at the end of the 13th century and completed at the beginning of the 14th; was injured by an earthquake in the middle of the 15th, and was rebuilt by Alfonso I.; and has since undergone frequent restorations, the last in 1837. Over the great entrance are the tombs of Charles I. of Anjou, Charles Martel, and his wife Clementia of Hapsburg. It also contains the tombs of King Andrew, of Pope Innocent IV., and of other noted personages. Opposite to the entrance of the basilica of Santa Restituta, on the site of a temple of Apollo, and once the place of worship for the Greek ritual, but now part of the cathedral, is the *cappella del Tesoro*, or chapel of San Gennaro (St. Januarius), with the two celebrated vials said to contain the blood of that saint, the liquefaction of which gives occasion for the greatest religious festivals of Naples. (See JANUARIUS, SAINT.) The "Tomb of San Gennaro," with the sick waiting to be cured, and several other paintings and frescoes in the chapel, are by Domenichino. The tomb is under the high altar in the richly ornamented subterranean chapel called the "confessional of San Gennaro," near the kneeling statue of Cardinal Carafa, which is said to have been executed by Michel Angelo. The church of Sant' Aniello a Capo Napoli, or Sant' Agnello Maggiore, in the piazza Sant' Agnello, has a painting of San Carlo by Caracciolo, said to be one of the most masterly imitations of Annibale Carracci. Beneath the richly decorated church de' Santi Apostoli, said to have been founded by Constantine on the ruins of a temple of Mercury, is a cemetery containing the tomb of the poet Marini. Among the other churches are Santa Chiara, with a Latin inscription over the Gothic tomb of King Robert the Wise, attributed to Petrarch, designed like many other monuments by Masuccio II.; and the church of San Lorenzo, associated with one of the stories of Boccaccio, with Petrarch, who resided for some time in the cloister attached to it, and with Alfonso I., who in the chapter house of this church proclaimed his natural son Ferdinand heir to the throne by the title of duke of Calabria. The convent and church of San Martino is celebrated for the magnificence of the view from it, as well as for the beauty of its architecture. Santa Maria del Parto, in the Mergellina suburb, called by the common people *il diavolo di Mergellina*, derives its name from Sannazzaro's poem *De Partu Virginis*, and

contains that poet's tomb.—Beggars abound in Naples in spite of the law. There are about 60 institutions devoted to charitable purposes. The most celebrated of them is the *albergo de' poveri* or *reclusorio*, an immense institution, which with its dependencies accommodates more than 5,000 persons. It is over 1,000 ft. long, but was intended by its founder Charles III. to cover a still larger ground, to serve as an asylum and an educational establishment for all the poor of the kingdom. To some extent it is made to answer this purpose; boys and girls are educated there and brought up to trades, and the boys generally enlist in the army. The greatest among the other hospitals is the *santa casa degl' incurabili*, or hospital for incurable diseases, but open to the sick of all descriptions; it is in high repute as a medical school, and accommodates about 2,000 patients. The hospital dell' Annunziata is chiefly intended for the reception of foundlings. There are annually about 2,000 foundlings out of 15,000 births, and they are better cared for in Naples than in other parts of Italy. The new hospital di Gesù Maria is the great clinical school attached to the university. The latter in 1873 contained 74 professorships and 1,500 students, and has a library of about 25,000 volumes. The Chinese college, founded by Father Ripa, a missionary in China, is intended for the training of young Chinese, who, after having completed their education, are employed as missionaries in their native country. The college of music, in which Bellini was educated, enjoys a high reputation, and has had for its directors Zingarelli and Mercadante. It gives free instruction to 100 pupils, and admits others at a small remuneration. The national school of medicine and surgery is attended by upward of 120 students, contains a pathological museum, and communicates by a subterranean passage with the practical medical school at the hospital for incurables. The public primary schools are still in a very unsatisfactory condition, numbering in 1872 only about 15,000 pupils.—The *società reale* comprises academies of science, of archæology, and of the fine arts, and the two former publish their transactions. The observatory of Naples, situated on the Capodimonte hill, about 500 ft. above the sea, is an elegant building, completed in 1820, after the plans of Piazzini, under whose direction it achieved great celebrity. The botanic garden was completed in 1818, and is remarkable for its collection of trees. The most notable new institution is the zoological garden, established in 1873, with one of the finest aquariums in the world. Naples possesses five public libraries: the Nazionale, of 200,000 volumes and 5,000 manuscripts; the Brancacciana, of 75,000 volumes; the university library; the Girolomini; and the *biblioteca del municipio*. The glory of Naples, however, is the museum, situated in a building originally intended for cavalry barracks, afterward remodelled from the designs of Fontana for the use of the university, and

for some time the seat of the academy of science. It is still called *palazzo degli studii pubblici*, or simply *studii*. The name *museo reale borbonico* was given to it by Ferdinand IV. (I.), who, after its enlargement in 1790 for the purpose of receiving the royal collection of art, caused all the antiquities and pictures in the royal palaces of Portici and Capodimonte to be brought into it in 1820. After the annexation of Naples to the Italian kingdom it was named *museo nazionale*. It contains collections of ancient frescoes, mosaics, and mural inscriptions, Egyptian antiquities, ancient sculptures, inscriptions, bronzes, glasses, pottery, cinquecento objects, papyri, gems, medals and coins, vases, paintings, and the national library. Among the ancient frescoes are more than 1,600 specimens found at Herculaneum and Pompeii. The collection of ancient sculpture contains the statues of the Roman emperors and a colossal bust of Julius Cæsar. The "room of the papyri" includes more than 1,700 rolls of writings from Herculaneum, disfigured by the effects of the fire, of which about 500 have been successfully unrolled. Several volumes of transcriptions from them have been published. The gallery of paintings was rearranged in 1866-'7. It contains 500 works, many of them masterpieces of the old painters; while the Neapolitan school can nowhere be studied so well as here. The best paintings are arranged in four rooms, apart from the main collections of the several schools, with some remarkable engravings, and drawings by the great masters.—The private palaces of Naples are far inferior in architectural beauty to those of Florence and other cities of upper Italy, but almost all of them contain museums of works of art. The most beautiful private palace is the palazzo Gravina, in the strada di Monte Oliveto, built at the end of the 15th century by Ferdinando Orsini, duke of Gravina, after the design of Gabriele d'Agnolo; it is now the property of the government, and used by the general post office and telegraph offices. The palazzo Piana, near the church of San Paolo, was the residence of the poet Marini. The palazzo Santangelo is remarkable for its fine statuary and collection of coins and medals, illustrative of the numismatic history of the Two Sicilies. The palazzo Monticelli, a fine specimen of the domestic architecture of the 15th century, was long the residence of the mineralogist Monticelli, whose collection of Vesuvian productions was purchased by the university and the British museum after his death. Naples abounds with fine villas, some of them commanding superb views on the bay. In its immediate environs are the grotta di Pozzuoli or di Posilippo, consisting of a tunnel about 2,250 ft. long and 21½ ft. wide, excavated in the older volcanic tufa, and containing near the top of the entrance the celebrated Roman columbarium known as the tomb of Virgil. The environs abound with many other remarkable sights, interesting to

the classical scholar, archæologist, and naturalist, as well as to the admirers of the beautiful and picturesque in nature, the vicinity of Vesuvius and other volcanic localities presenting scenes of matchless grandeur.—The principal places of amusement are the theatres. The San Carlo, adjoining the royal palace, was long the largest Italian opera house in the world. It was designed, by order of Charles III., by Medrano, a Sicilian artist, built in the short space of eight months by Angelo Carasale, a Neapolitan architect, and opened in 1737. It was burned down in 1816, but rebuilt after seven months without altering the original form. It has six tiers of boxes of 32 each, and the pit accommodates more than 1,000 persons. The teatro del Fondo, in the strada Molo, is under the same management as the San Carlo, and is exclusively devoted to operas and ballets. The oldest theatre in Naples is the teatro de' Fiorentini, now the popular stage of the Italian drama. The opera buffa is represented chiefly in the teatro Nuovo. The teatro Partenope is a popular theatre, in which farce and comedy are performed twice a day in the Neapolitan dialect. The theatre of San Carlino is the home of Pulcinello. The performances take place in the morning and evening in the Neapolitan dialect, and are attended by all classes of the population.—The scholars and savants, artists, jurists, medical men, and the higher middle and professional classes of Naples generally, constitute a very intelligent and refined society; and its men of science and scholars are celebrated in Italy for their devotion to their respective branches of study. The number of strangers is great at all times, but particularly during the winter, notwithstanding the frequently dangerous effect of the climate upon foreign constitutions, especially upon consumptive patients.—Naples has three ports: the Porto Piccolo, the last remains of the ancient port of Palæopolis, and now only suited to small craft; the Porto Militare, a new harbor with a depth of water of five fathoms, bounded N. by the Porto Grande and S. by a mole which runs in a S. E. direction into the sea for a distance of 1,200 ft.; and the Porto Grande, the principal port, but with only three or four fathoms in its deepest part, having suffered from the silting of the sand and shingle. Between the Porto Grande and Porto Piccolo is the *immacolatelle*, with the offices of a branch of the board of health and the captain of the port. On the other side of the Porto Piccolo is the custom house. New docks are projected. The Mandracchio district, S. E. of the latter port, is inhabited by the dregs of the Neapolitan population. The principal imports of Naples are sugar, coffee, and other colonial produce; coal, salted fish, cotton (the cultivation of which has of late enormously increased in the surrounding region), woollen, silk, and flax goods; iron, tinware, and hardware. The chief exports are products of the surrounding

country, chiefly consisting of staves, coral, olive oil, tartar and wine lees, madder, liquorice, hemp, and fruits, and amounting in 1873 to nearly \$9,000,000; imports, chiefly colonial products, cotton, woollen, and silk goods, fish, grain, and metals, nearly \$25,600,000. The shipping comprised 4,703 inward and 4,724 outward vessels, tonnage 1,020,758 and 998,421. There are several great banks, and most of the business men are more or less interested in financial schemes, which are often carried on in a reckless manner. Many banks recently established without adequate capital have resulted in bankruptcies and financial chaos. Merchants are arranged by the chamber of commerce into five different classes, and credit to a certain amount at the custom house for the payment of duties is granted to them accordingly. The most important manufacture is of macaroni and vermicelli, which constitute the principal food of the people. Next in importance is the production of silk goods, the *gros de Naples* taking its name from the manufacture of this city. There are also iron and glass works, type foundries, and manufactories of carpets, broadcloth, chemicals, soaps, perfumery, artificial flowers, corals, porcelain, hats, carriages, gloves, &c.—For municipal purposes the city is divided into 12 districts. There is a garrison of 6,000, and the national guard numbers 14,000. The prisons of Naples have had an infamous reputation, but have been much improved of late years. The most important have already been mentioned.—The principal antiquities of Naples are the catacombs, which are of greater extent than those of Rome. (See CATACOMBS, vol. iv., p. 95.) The environs abound with celebrated relics of antiquity, but in the city proper there are not many of them, excepting the fragments of the temple of Castor and Pollux, of the Julian aqueduct, now called *Ponti Rossi*, and a few other remains. The greatest authority on Neapolitan inscriptions is Mommsen's *Corpus Inscriptionum Neapolitanarum* (Leipsic, 1851).—Several of the learned Neapolitan antiquaries claim for Naples a Phœnician origin, but it is generally considered to have been originally a Greek city and colony of Cumæ, although the account of its first foundation, under the name of Parthenope, is regarded by many authorities as a mythical tradition. According to several accounts the city was, after its increase through settlers from various parts of Greece, divided into an old town (Palæopolis) and a new town (Neapolis). But the identity of the connection between the two names is not yet clearly established. Niebuhr places the situation of Palæopolis near the site of the present town of Pozzuoli, and Livy refers to them as close to each other; but long before his time (330 B. C.) Palæopolis is mentioned as having been engaged in hostilities with Rome, and the name seems soon afterward to have disappeared from history, and to have become merged in Neapolis, which early became

a faithful ally and dependency of Rome, and noted for the courage of its citizens from their successful resistance to the attack of Pyrrhus in 280 B. C., while the strength of its fortifications caused Hannibal to leave the place unmolested during the second Punic war. It retained to a far greater extent than other Italian cities its Greek culture and institutions, and many of the higher classes of Romans resorted to Neapolis for their education, on account of the beauty of the climate and the scenery, and of its hot springs. It recovered quickly from the calamities of the civil war of Marius and Sulla. Under the empire it continued to be a favorite resort of the Roman nobility. Nero made his first public appearance as an actor on the stage of Naples, and the voluptuous character of the city caused it to be called by Ovid *in otia natam Parthenopen*. The great tunnel under Posilippo was then as now an object of admiration. The chief glory of the city was its association with Virgil, who resided there for a considerable period. Naples was taken by the Goths in A. D. 493, retaken by Belisarius in 536, and reduced and dismantled by Totila in 543. About 570 it was constituted a separate duchy, forming a dependency of the exarchate of Ravenna. After the fall of the exarchate in the 8th century it enjoyed for about 400 years an independent government under dukes of its own election, though often engaged in hostilities with the Lombard dukes of Benevento, to whom it was obliged to pay tribute. When the duchy of Benevento was divided into three principalities, the prince of Capua endeavored to gain the supremacy, and succeeded in temporarily seizing Naples (1027); but the Normans, having conquered all the rest of southern Italy and Sicily, reduced Naples after a protracted siege; and the city submitted to Roger I. of Sicily about 1137. On the extinction of the Norman dynasty in 1189, Naples became subject to the house of Swabia. In 1268, under the Anjou dynasty, Naples superseded Palermo as the seat of the government. In 1442 the last king of the Anjou dynasty was conquered by Alfonso of Aragon. Charles VIII. of France conquered Naples in 1495, but was driven out by Gonsalvo de Cordova. Under the Aragonese and Spanish kings it was ruled by viceroys till the peace of Utrecht (1713), when it was annexed to the possessions of the house of Hapsburg. The popular insurrection under Masaniello took place in 1647. Charles, son of Philip V. of Spain, became master of the city and kingdom in 1734, and founded the Bourbon dynasty. The French took it in 1799 and again in 1806. Joseph Bonaparte was made king of Naples, but was replaced in 1808 by Murat, who was displaced by the Austrians in 1814, when the Bourbons were restored. The city was the scene of a revolutionary conflict on May 15, 1848. It was entered by Garibaldi in September, 1860, and incorporated with the dominions of Victor Emanuel. Naples has been often alarmed by

earthquakes, and a severe eruption of Vesuvius in April, 1872, resulted in the loss of some 200 lives, and the city was covered with a shower of ashes. A railway to the summit of Vesuvius was commenced in 1875.

NAPÓ, a river of South America. See ECUADOR, vol. vi., p. 394.

NAPOLÉON BONAPARTE. See BONAPARTE.

NAPOLÉON-VENDEE, a town of France, capital of the department of Vendée, on the river Yon, 231 m. S. W. of Paris; pop. (including the suburb of Roche-sur-Yon) about 9,000. It consists of several streets crossing each other at right angles, nearly all ending in the place Royale, a spacious square, bordered by ranges of pine trees, and surrounded by public monuments and fine mansions. It is situated upon an open heath, and has few manufactures and little trade. The town occupies the site of a large feudal castle built prior to the crusade, which was destroyed by the republicans in 1793. In 1805 Napoleon selected the place as the site for the capital of the department, and devoted 3,000,000 francs to the erection of public edifices, giving to the new town the name which it now bears. Under the restoration it was called Bourbon-Vendée.

NAPOLI DI ROMANIA. See NAUPLIA.

NAQUET, Alfred Joseph, a French chemist, born in Carpentras, Oct. 6, 1834. He completed his studies in Paris, where he took his medical degree in 1859. In August, 1863, he was named professor at the school of medicine, to enter upon his duties in November, 1865. In the interval he was employed by the Italian government in establishing a professorship of chemical and physical sciences in the national technical institute at Palermo. After lecturing on organic chemistry in the medical faculty of Paris till 1867, he incurred 15 months' imprisonment and a fine for having been one of the organizers of the congress at Geneva, and having submitted to it a resolution calling the first Napoleon the greatest malefactor of his day. In March, 1869, he was again arrested and fined on account of his opposing the rites of marriage (his own marriage had been celebrated in 1862 without the attendance of a clergyman) in his publication entitled *Religion, propriété, famille*, in which however he defended the rights of property. After the revolution of Sept. 4, 1870, he was military secretary to the government at Tours and Bordeaux. His election to the assembly, Feb. 8, 1871, being contested by the monarchists, he was reelected, July 2, by a large majority. Among his scientific works are: *Principes de chimie fondés sur les théories modernes* (1865); *De l'atmicité* (1868); and *Précis de chimie légale* (1872). His chief political work is *La république radicale* (1873).

NARBONNE (anc. *Narbo Martius*), a city of Languedoc, France, in the department of Aude, near the Mediterranean, with which it is connected by a canal, 33 m. E. of Carcassonne, and 54 m. S. W. of Montpellier; pop. in 1866,

17,172. The most remarkable edifices are the cathedral of St. Just, a handsome Gothic structure founded in the 13th century; the church of St. Paul, an ancient building in the Romanesque style; and the hôtel de ville, formerly the archiepiscopal palace, one of the towers of which dates from the 14th century. Within it Louis XIII. signed the order for the arrest of Cinq-Mars and De Thou. The seat of the archbishopric has been transferred to Toulouse. There are important manufactures of verdigris, linen, woollen, and leather, and trade in wine, and in honey celebrated for its whiteness.—*Narbo Martius* was founded by the Romans in 118 B. C. Many of the soldiers of Cæsar's tenth legion having been settled there at the end of the civil war, it was thence frequently called *Decumanorum Colonia*. It was taken by the Saracens in 719, and held by them for nearly half a century. In the middle ages it was one of the most flourishing towns in France, containing more than 40,000 inhabitants. No building of the Roman period now exists, the ruins having been used in the construction of the city walls, in which about 500 Roman bass reliefs, friezes, and inscriptions were visible, besides Saracenic ramparts. The walls were pulled down after 1865, and many of the ancient sculptures are gathered in the museum. Varro, the Latin poet, and the Roman emperor Carus, were born in or near Narbonne. One of the four provinces of Gaul, as divided by Augustus, was called from this city *Gallia Narbonensis*.

NARBONNE-LARA, Louis, count de, a French soldier, born at Colorno, in the duchy of Parma, Aug. 24, 1755, died in Torgau, Germany, Nov. 17, 1813. He was educated with the French princes, became a colonel in 1780, and was employed in the ministry of foreign affairs under Vergennes. In 1789 he became very popular at Besançon, where in 1790 he was placed in command of the national guard; but he was always loyal to the royal family. He accompanied the king's aunts when they left Versailles in 1791, and, after seeing them safe out of France, returned to Paris. He was appointed minister of war, Dec. 6, 1791, but was dismissed in March, 1792, and joined the army. After the attack on the Tuileries, Aug. 10, 1792, when he was present in the capital and displayed great courage, he fled to London, where he wrote a memoir to the convention in behalf of Louis XVI. He returned to France in 1800, and was restored to his rank as general of division in 1809. He accompanied Napoleon as special aide-de-camp to Russia, was ambassador to Vienna in 1813, minister to the congress at Prague, and finally military commander at Torgau.

NARCISSUS. 1. A mythical youth, son of the river god Cephissus and the nymph Liriope, who was remarkable for his beauty, but wholly inaccessible to love. The nymph Echo died of grief because he would not reciprocate her affection. One of his rejected admirers begged

Nemesis to punish him, and the goddess caused him to fall in love with the reflection of his own figure in a spring. Under the influence of this passion he pined away, and after death was changed into the flower which bears his name. **II.** A freedman and secretary of the Roman emperor Claudius, who was completely subject to his influence. For some time he used his power in subservience to the wishes of the empress Messalina; but when he found that she meditated his destruction, he determined to anticipate her, and, revealing to Claudius her marriage with Caius Silius, convinced him that his own safety required her immediate sacrifice. The emperor consented to her imprisonment, but as he manifested reluctance to have her put to death, Narcissus sent a tribune to despatch her. Agrippina, whose intrigues in favor of her son Nero Narcissus had thwarted, had him removed to Campania, where he was murdered by her orders, A. D. 54. He is said to have amassed a fortune of 400,000,000 sesterces, equivalent to \$13,500,000. **III.** A Roman athlete, with whom the emperor Commodus was in the habit of contending in the arena, and who was afterward employed by Marcia to strangle his patron. For this crime Septimius Severus, on his accession (A. D. 193), had him given to the lions.

NARCISSUS, the common as well as the botanical name of a genus of popular garden flowers. It is often said that the name is from that of the youth of Grecian mythology who was turned into the flower. Prior regards this as "an instance, among many more, of a legend written to a name," and considers it to be derived from *ναρκάειν*, to become dumb, as it had the reputation of causing torpor or heaviness by its perfume. The genus belongs to the amaryllis family, and consists of bulbous-rooted plants, with flat or channelled, linear leaves, an often compressed or angular scape or flower stalk, at the top of which is a spathe, which bursts at one side and liberates one to several flowers. The tube of the perianth (calyx and corolla together) is prolonged above the ovary, with six equal spreading divisions; stamens six, of unequal length, included in a cup-shaped or tubular white or colored crown, which springs from the corolla-tube at their base; ovary three-celled, with a simple style and an obtuse stigma. This genus, which is mainly south European, extending into Asia, has been divided by some botanists in a most perplexing manner. While some regard it as containing only a few species, others, upon trivial characters, have made some 15 genera, with about 100 species. In popular nomenclature the genus is divided into narcissus, jonquil, and daffodil. Those recognized as narcissuses have a very short, cup-like crown to the flower. One of the best known of these is the poets' narcissus (*N. poeticus*), large clumps of which are common in old gardens; the scape, about a foot high, bears but a single flower, of the purest white color, yellowish at the throat, the

small crimped crown with a bright pink or scarlet edge; there is a double variety in which the crown disappears; this species, which is very fragrant, especially when double, is a

Poets' Narcissus (*N. poeticus*).

native of southern Europe from France to Greece. The two-flowered narcissus (*N. biflorus*) is also a native of the south of Europe, but has become thoroughly naturalized in England, and is thought to be native to some parts of that country; it has two white or pale straw-colored flowers to each stem, the flowers having a short yellow crown; this is also sweet-scented, and is the primrose peerless and pale daffodil of the old gardeners. The hoop-petticoat narcissus (*N. bulbocodium*) has its leaves and flower scapes 6 to 9 in. long; the solitary bright flower is 1½ to 2 in. long, with a very

Two-flowered Narcissus (*N. biflorus*).

conspicuous cup, which widens rapidly toward the brim; it is an exceedingly neat and pretty species for the border or for pot culture. The most prized of all is that known as the poly-

anthus narcissus, which originated from *N. Tazetta*, perhaps crossed with other species; the catalogues give numerous named varieties; in all the bulbs are large, the flat leaves about

Polyanthus Narcissus (*N. Tazetta*).

a foot long, and the flower stem, of about the same height, produces a cluster or umbel of six to ten large very fragrant flowers; in the different varieties corolla and cup are both of different shades of yellow, or the one is white while the other is yellow, and in some the cup is double. While this is the finest, it is the most tender of all; but in the climate of New York city, if planted 6 in. deep, and covered with litter, it flowers freely in spring. It is very popular for forcing for winter blooming.—The species known as jonquil (dimin-

Daffodil (*Narcissus pseudonarcissus*).

tive of Span. *junco*, from Lat. *juncus*, a rush) is *N. jonquilla*, which has narrow rush-like or half cylindrical leaves, which with the flower scapes are about a foot long; flowers two to

five, small, yellow, and fragrant; there is a double variety. The daffodil, which in England more than in this country is called daffodilly and daffadowndilly, derives its name from *asphodelus*, through affodilly, &c.; the species generally known by this name is *N. pseudonarcissus*, which has flat leaves and the scape bearing a single large flower having a large crown or cup; in the typical form the cup and petals are of a uniform yellow color, but in the variety *bicolor* the petals are white and the cup yellow, and there are several other varieties, including double and dwarf ones. One of the plants known by the garden name of "butter and eggs" is the double form of the incomparable daffodil (*N. incomparabilis*), in which large lemon-colored petals are intermingled with smaller orange-colored ones. There are several other species, but they are rarely seen in ordinary cultivation.—The common poets' and two-flowered narcissus, the jonquil, and daffodil are very common in gardens, especially in country places, where they remain in the same place year after year, and form large clumps which show a small number of flowers for the quantity of foliage; being so hardy, they are left to themselves until the soil about them becomes filled with bulbs and roots and completely exhausted. To have them flower satisfactorily the clumps should be taken up in autumn, divided, and set in fresh soil. The treatment of the tender sorts is indicated under POLYANTHUS. The method of forcing in pots is the same as for similar bulbs (see HYACINTH). The varieties of polyanthus are those most generally seen in window culture, but the commoner species are bright and welcome in winter, and might be more generally used for indoor blooming than they are. The gardeners near New York and other cities force great quantities of the poets' narcissus, daffodils, &c., and send them to market in early spring in full bloom.

NARCOTICS (Gr. *νάρκη*, torpor), substances which when taken into the blood affect all parts of the nervous system, but especially the higher nervous centres, in the direction of paralysis. A primary stage of stimulation sometimes precedes the true narcotic effect, but much of what is called stimulation, as for instance the noisiness or restlessness of alcohol, is in reality the beginning of narcotism, being due to a gradual removal of the restraints imposed by the higher faculties, by custom, or by timidity, upon the lower impulses. In the later stages of narcotism the faculties of sensation, of voluntary and reflex motion, are abolished, and death may result from paralysis of the centres that govern the circulation and respiration. Familiar examples of this class of drugs are opium, alcohol, and chloroform. The symptoms of narcotism manifested by special drugs are described under the titles of those drugs, and to them the reader is referred.

NARCOTINA. See OPIUM.

NARD. See SPIKENARD.

NARES. I. James, an English composer, born at Stanwell, Middlesex, in 1715, died in 1783. He was educated as a chorister at King's chapel, London, under Bernard Gates and Dr. Pepusch. In 1734 he was appointed organist of York cathedral, in 1756 organist and composer to George II., and in 1757 master of the choristers in the chapel royal. The last named office he resigned in 1780. He composed several anthems and services for the royal chapel, and published "Twenty Anthems in Score," which is still in constant use in the cathedrals of England and Ireland. He also published "The Royal Pastoral, a Dramatic Ode," and "A Collection of Catches, Canons, and Glees."

II. Robert, an English author, son of the preceding, born in 1753, died in 1829. He was educated at Oxford, took orders in 1778, and became rector of Sharnford, Leicestershire, and preacher at Lincoln's Inn. Subsequently he was assistant librarian at the British museum, became archdeacon of Stafford, and held other preferments. He published "Elements of Orthoëpy" (1784); "A Connected and Chronological View of the Prophecies relating to the Christian Church" (1805); "The Veracity of the Evangelists Demonstrated" (1815); and a "Glossary of Words, Phrases, &c., which have been thought to require illustration in the works of English authors" (4to, 1822; new ed., edited by J. O. Halliwell and T. Wright, 2 vols. 8vo, 1859). With Mr. Beloe he founded the "British Critic," which he edited for four years.

III. Edward, an English author, cousin of the preceding, born in London in 1762, died at Biddenden, Kent, Aug. 20, 1841. He was educated at Westminster school and at Christchurch college, Oxford, and became a fellow of Merton college in 1788. He took orders in 1792, married a daughter of the duke of Marlborough in 1797, and in 1798 became rector of Biddenden. He was appointed Bampton lecturer in 1805, and professor of modern history at Oxford in 1814. His works are: "On the Plurality of Worlds" (1802); "Evidences of Christianity" (Bampton lectures, 1805); "Remarks on the Version of the New Testament lately published by the Unitarians" (1810); "Thinks I to Myself," a novel (1811); "Discourses on the Three Creeds" (1819); "Elements of General History," a continuation of Tytler's work (1822); "Heraldic Anomalies" (2 vols., 1824); and "Memoirs of the Life and Administration of William Cecil, Lord Burghley" (3 vols., 1828-'31).

NARO, a town of Sicily, in the province and 12 m. E. of the city of Girgenti, on the river Naro; pop. about 11,000. It is of Saracenic origin, and renowned for its picturesque situation, and has a feudal castle bearing the arms of the Chiaromonte family. It contains several churches and other buildings of great antiquity, and has an active trade in sulphur, wine, and oil.

NARRAGANSETT BAY, on the S. E. coast of Rhode Island, extends from Point Judith on

the W. to Seconnet on the E., and N. to Bullock's Point, 6 m. below Providence; it is 28 m. long by from 3 to 12 m. wide. It receives the Pawtuxet, Providence, Pawtucket, and Taunton rivers, and contains a number of islands, the principal of which are Rhode island, Canonicut, and Prudence. It is easily accessible, and affords excellent harbors and roadsteads. Newport, Bristol, Warren, and other towns are on its borders. It is well supplied with lighthouses, and strongly fortified.

NARRAGANSETTS, an Algonquin tribe of American Indians, who occupied the territory now comprised in Rhode Island. They were less warlike and more industrious than the Pequots. They had 12 towns within a distance of 20 m., and were very numerous. In 1621 their chief Canonicus sent to Plymouth a bundle of arrows tied with a snake skin, indicating hostile intentions. Gov. Bradford returned the skin filled with powder and shot, which seemed to have a quieting effect. In 1636 Roger Williams won the Narragansetts to peace, and they made a treaty and cooperated with Mason against the Pequots. In 1644 Gorton induced them to cede their lands to the king. They engaged in hostilities in 1645, but submitted to a treaty Sept. 5, agreeing to pay indemnity to the colonies. In King Philip's war they were suspected of aiding their old enemies the Pokanokets, and a force of 1,000 men, with 150 Mohegans and Pequots, captured and burned their fortress. Canonchet, their chief, then cut off two English parties and destroyed many frontier villages, but was at last taken by Denison and shot. A large force was then sent to crush the tribe. Their chief fortress, on an island in a swamp in South Kingston, was taken after a stubborn fight, and it was estimated that 1,000 men, women, and children were killed; the colonial loss was 230. This war almost exterminated the Narragansetts. The remnant settled at Charlestown, R. I., and prospered. In 1822 there were 407 on their reserve of 3,000 acres, with a missionary, a church, and 50 pupils at school. In 1833 they had declined to 158, only 7 being of pure Narragansett blood. Their language is preserved in Roger Williams's "Key into the Language of America," &c. (London, 1643).

NARSES, a Byzantine general, born about A. D. 473, died in Rome about 568. He was a eunuch and a slave of Justinian, but rendering important services to his master during the riots of "the blue" and "the green" in 532, he was appointed imperial treasurer, and was subsequently sent on several embassies. In 538 he commanded the reinforcements sent to Belisarius, then waging war against the Goths in Italy; but his jealousy of that general, whom he is supposed to have had instructions from Justinian to thwart, paralyzed the Roman arms and led to the capture of Milan by the Goths. Narses was recalled shortly after, and for the next 12 years his name is hardly mentioned in the Byzantine annals; but in the im-

perial councils he continued to exercise a predominant influence. He commanded a second expedition against the Goths in Italy in 552, and near Rome gained a victory over King Totila, who perished with 6,000 of his soldiers. This triumph led to the surrender of Rome and several of the strongest fortresses in central Italy. A vast barbarian army under Teias, the successor of Totila, was soon afterward defeated on the banks of the Sarno, near Naples, after a battle of two days, in which Teias was slain. The Franks and Alemanni, to the number of 75,000, now descended from the Alps, and spread themselves over the whole peninsula. When they had become demoralized and weakened by rapine, Narses attacked them at Casilinum in Campania, on their return northward, with such vigor that out of 30,000 men only 5,000 are said to have escaped. This victory ruined the barbarian power in Italy, which once more became a province of the empire. Narses was rewarded by the appointment of governor of the conquered territory, and ruled at Ravenna with the title of exarch for about 14 years. After the accession of Justin II., being dismissed from office, he invited the Lombards to invade Italy, probably anticipating that he would be restored to power in order to repel them. In this he was disappointed, and he is said to have died of grief at the ruin he brought upon the country.

NARUSZEWICZ, Adam Stanislaw, a Polish historian, born in Lithuania in 1733, died at Janowiec, Galicia, in 1796. He entered the order of Jesuits in 1748, travelled through Germany, France, and Italy, was appointed professor at Warsaw, and became bishop of Smolensk in 1773, and of Luck in 1790. His "History of Poland" (8 vols., Warsaw, 1780 *et seq.*) gained him the surname of the Polish Tacitus. Among his other works are a history of the Tartars, idyls, satires, and other poems.

NARVA, a town and port of European Russia, in the government and 80 m. S. W. of the city of St. Petersburg, on the left bank of the Narova; pop. in 1867, 6,175. It is surrounded with a rampart, and has manufactories of nails, extensive saw mills, and productive fisheries. It was founded in the 13th century, and was formerly a member of the Hanseatic league, and celebrated for its commerce previous to the foundation of St. Petersburg. The inhabitants of Narva proper are nearly all of German descent, while the suburb of Ivangorod is almost exclusively inhabited by Russians. Near this town Charles XII., on Nov. 30, 1700, with an army of 8,500 Swedes, defeated more than 50,000 Russians under Peter the Great.

NARVAEZ, Pamfilo de, a Spanish explorer, born in Valladolid about 1480, perished off the southern coast of Louisiana in 1528. He came to America apparently as early as 1501, served in Santo Domingo, and then passed to Cuba, where he stood next in command to Velazquez, the governor. Sent to Mexico to reduce Cortes, he was defeated, lost an eye,

and was confined as a prisoner by Cortes for five years. He then went to Spain, obtained a grant of Florida, and sailed with a large force in 1527. He landed at Tampa bay, April 16, 1528, and marched to Appalache. Finding the country poor and thinly peopled with fierce tribes, he at last made for the coast, built rude boats, and endeavored to reach Mexico. Soon after crossing the mouth of the Mississippi he was blown out to sea in his boat and perished. Most of his force sank under hardship or hostilities, but his treasurer Cabeça de Vaca and others made their way across the continent, and finally reached the Spanish settlement of San Miguel in Sonora in May, 1536. His accounts led to the exploration of New Mexico and California.

NARVAEZ, Ramon Maria, duke of Valencia, a Spanish statesman, born in Loja, Andalusia, Aug. 4, 1800, died in Madrid, April 23, 1868. He was early engaged in military operations, and was wounded during the capture of Castelfolli in 1822. In 1823, when the French army of intervention entered Spain, he retired to Loja, but returned to the army in 1832, and in 1834 was wounded in the battle of Mendi-gorria. In 1836 he acted under the orders of Espartero, and the reputation which he gained by defeating the Carlist general Gomez (Nov. 25, 1836) led to his advancement. In 1838, by his rigorous measures against the brigands who infested La Mancha, he restored tranquility to that province; and he was appointed captain general of Old Castile and general of an army of reserve. He had also been elected to the cortes from Seville, and on the formation in that city of a revolutionary junta by Cordova, he repaired thither to aid that general in his movements against Espartero; but the insurrection was suppressed, and Narvaez was compelled to seek refuge in France (1840). While there he continued his machinations against Espartero, in conjunction with the queen mother Maria Christina; and in 1843, at the head of the Christinos, he landed at Valencia, defeated Gen. Seoane at Torrejon de Ardoz (July 22), and made his entry into Madrid, which led to the overthrow of Espartero. In 1844 he became prime minister, and was created field marshal, count of Canadas Altas, and duke of Valencia. Maria Christina was permitted to return to Madrid, and the opponents of the constitution of 1845 were put down rigorously. His arbitrary disposition gave offence to many members of his own party, and brought him into collision with Maria Christina, and he resigned in February, 1846. After having served for a short time as ambassador in Paris, he was recalled to power in 1847, but was soon dismissed on account of quarrels with the queen mother. On Oct. 21, 1849, he was restored to office, and opposed the British government's attempt to interfere in Spanish affairs with a firmness which led to the withdrawal of the British minister (Sir Henry Bulwer) from Madrid, and to the temporary interruption of

diplomatic relations between the two governments. He resigned Jan. 10, 1851, and became ambassador to Vienna. After Espartero's withdrawal, July 14, 1856, and O'Donnell's brief term of office, Narvaez was again called upon to preside over the cabinet, Oct. 12, but without special office. The concordat of 1851 with the holy see, which had been variously modified, was restored. The outbreak at Malaga on Nov. 16 was put down by force of arms, and a general amnesty to the Carlist rebels of 1855 and 1856 was promulgated, April 8, 1857. Narvaez caused stringent laws to be enacted against the press, and made various dignitaries of church and state *ex officio* members of the senate. Overthrown in November, 1857, he became once more chief of the cabinet in September, 1864; and in January, 1865, he proposed in the cortes the abandonment of Santo Domingo, which was adopted after protracted discussions. In June of the same year his ministry was overthrown; but in July, 1866, he was again prime minister, and held that post till his death.

NARWHAL, a cetacean mammal, of the genus *monodon* (Linn.), frequenting the arctic seas; its popular name is sea unicorn. It has no proper teeth, but in the males, and sometimes in the females, there are two tusks arising from the internaxillary bone; these are true incisors, but only one, usually the left, is developed, the other remaining rudimentary in most cases; the former is long, pointed, spirally twisted and grooved, and directed straight forward, growing through life from a permanent pulp as in the elephant. The tusk, of solid ivory and 6 or 8 ft. long, is a most formidable weapon when wielded by such an active and powerful animal, and is sometimes driven deeply into the timbers of a ship. According to Mulder there are two small teeth in the gum of the upper jaw. In the only well ascertained

Narwhal.

species (*M. monodon*, Linn.) the body may attain a length of 15 or 16 ft., and the tusk from 6 to 10 additional; there is no well marked separation between the head and body; the forehead rises suddenly, and the blow-hole is on the top of the head; the eyes and mouth

are small, and the lips unyielding; the pectorals are small for the size of the animal; the caudal is transverse, bilobed, and about 4 ft. wide; instead of a dorsal fin there is a low fatty ridge 2 or 3 ft. long in the middle of the back. The prevailing color is dark gray above with numerous darker spots, white on the sides and below, on the former with grayish spots; some specimens are very light-colored, and the young are said to be bluish gray. The food consists principally of cephalopod mollusks, and, on the authority of Scoresby, of flat and other fishes, which it transfixes with its horn; other uses of this weapon are for breaking the ice for the purpose of obtaining air, and for defence. Narwhals are sometimes seen in bands of 10 to 20, sporting about whaling ships, elevating their tusks above the water, and playing about the bows and rudder; they are migratory, and their appearance is hailed with delight by the Greenlanders, who consider them the certain forerunners of the right whale; and this, the result of their experience, is probably due to both using the same kind of food. They are harpooned for their ivory, oil, and flesh; the last is considered a delicacy as food by the Greenlanders. The blubber is from 2 to 4 in. thick, and yields a very superior oil. The ivory of the tusk is very hard and white, and takes a high polish; it was formerly a valuable article of commerce, when the origin of the horns was less known; a famous throne of the kings of Denmark is said to be made of the ivory of narwhals' tusks.

NASCAPEES, and **Nehirolini** or **Montagnais**, Indian tribes of Labrador, the most easterly division of the great Algonquin nation. The Nehirolini, called Montagnais by the French Canadians, now occupy the territory from the Saguenay to the straits of Belle Isle; but when the French first settled Quebec they held the valley of the St. Lawrence from above that point. They were always friendly to the settlers, but were driven back by the Iroquois and the want of game to their present location, the Esquimaux retiring before them. The Catholic missions among them established in Champlain's time are still maintained; but they are hunters, and cannot be made cultivators. The caribou is their chief game. They dress well in skins or purchased clothing, but live in wretched cabins of poles covered with bark and branches, often pitched on the snow or damp grounds. La Brosse, the last of the old Jesuit missionaries, taught them generally to read and write, and this knowledge is still maintained by family instruction. They numbered in 1872 about 1,700 in various bands at Point Bleu, Chicoutimi, Moisie, the Seven Islands, Cascapediae, and River Godbout. The Nascapees or Naskapis (*i. e.*, people standing upright) occupy the table land in the interior from Lake Mistassini to the Atlantic. They are shorter and lighter than the Montagnais, with clear-cut features and large eyes. Their language is so near the Montagnais that they

talk with each other without difficulty. They are slovenly in their persons and careless, often in want, and driven even to acts of cannibalism. Missions have benefited some bands only. They telegraph by fires on high places, and mark their routes by poles with bark pendants. They believe in a great spirit and in Atshem, a spirit of evil. The government returns of 1870 put their number at 2,860. These two tribes have been styled by Gallatin and others Sheshapootosh and Scoffies, names unknown in Canada and derived only from an ignorant Micmac boy. Grammars and dictionaries of the Montagnais by missionaries at various dates exist in manuscript, but only devotional works have been printed in the language.

NASEBY, a village of Northamptonshire, England, 12 m. N. N. W. of Northampton, where was fought a decisive battle between Charles I. and the parliamentary forces under Fairfax, June 14, 1645. After the capture of Leicester by the royal army, Fairfax, who was besieging Oxford, marched into Northamptonshire. The two armies, about equal in number, confronted each other on the morning of June 14, the parliamentarians occupying a strong position near Naseby, and the king's troops being drawn up one mile south of Harborough. The royal centre was commanded by the king in person, the right wing by Prince Rupert, and the left by Sir Marmaduke Langdale. Fairfax, supported by Skippon, commanded the centre of his army, with Cromwell on his right wing and Ireton on his left. The royalists made the attack, and Rupert with his cavaliers charged with such fury upon Ireton that his wing was broken and put to flight. Instead of supporting his royal kinsman, Rupert detached himself from the main battle to pursue the fugitives. The royal centre maintained an obstinate contest till Cromwell, having routed the forces of Sir Marmaduke Langdale, fell suddenly upon its rear, when, unsupported by either of its wings, it almost immediately surrendered. One regiment alone held out for the king, but was finally broken by repeated charges. At this moment Rupert returned from his needless pursuit of Ireton's troops, with his men and horses exhausted and the time for effective aid gone by. The king saved himself only by a precipitate flight. The royalists lost 800 killed and 4,500 prisoners, besides their artillery and ammunition; the parliamentarians had 1,000 killed. A number of private letters between Charles and his queen, subsequently published under the title of "The King's Cabinet Opened," also fell into the hands of the victors.

NASH, a N. E. county of North Carolina, bounded S. W. by Contentny creek and N. by Swift creek, and intersected by Tar river; area, 640 sq. m.; pop. in 1870, 11,077, of whom 4,721 were colored. The surface is uneven. The chief productions in 1870 were 8,046 bushels of wheat, 152,506 of Indian corn, 14,356 of oats, 24,907 of sweet potatoes, and 3,697 bales of cotton. There were 845 horses, 444

mules and asses, 1,443 milch cows, 911 working oxen, 2,073 other cattle, 2,619 sheep, and 10,697 swine. Capital, Nashville.

NASH, Joseph, an English water-color painter, born about 1813. He is chiefly distinguished as a painter of architecture, and his "Architecture of the Middle Ages" (fol., 1838), and "Mansions of England in the Olden Time" (4 vols. fol., 1839-49), lithographed in colors from his drawings, are among his works which have been published. He has painted historical scenes from Shakespeare and Scott, and miscellaneous subjects, such as "The Queen's Visit to Lincoln's Inn Hall" (1846), "Charles V. visiting Francis I." (1865), "The Chapel of Edward the Confessor in Westminster Abbey" (1866), and "Louis Philippe's Bedroom at Claremont" (1867).

NASH, Richard, known as Beau Nash, born in Swansea, Glamorganshire, Oct. 18, 1674, died in Bath, Feb. 3, 1761. After a preliminary education at Carmarthen school, he was entered at Jesus college, Oxford, where he displayed some ability, but was chiefly distinguished by dissipation. To preserve him from an imprudent marriage, he was at 17 years of age removed from the university, and his father purchased for him a commission in the army; but wearying of the monotony of barrack life, he entered himself a student of law in the Middle Temple. Instead of studying, however, he devoted himself to pleasure, and with resources supplied from the gaming table he became a leader of fashion and a man about town. On the occasion of an entertainment given by the members of the Middle Temple to William III., he conducted the pageant with so much tact and address that the king offered to knight him; but Nash, sensible of his uncertain means of support, declined the honor. In 1704 he visited Bath, then just rising into importance as a watering place, and the citizens appointed him master of ceremonies. He succeeded in a short time in securing for the place the reputation of an agreeable resort for valetudinarians as well as mere seekers of pleasure. Decency of dress and civility of manners were enforced in the public resorts, an elegant assembly room was built, streets and buildings were improved, and in process of time a handsome city was established in place of what had been only a dull provincial town. Nash himself shared in the prosperity which he had promoted, and, from his influence and the deference in which he was held by citizens as well as visitors, was styled the "king of Bath." Supporting himself still by the gaming table, he lived in great style, travelling in a coach and six with outriders, and dispensing charities with reckless profusion. Toward the close of his life his glory waned, and after the act of parliament against gambling he lived in comparative indigence. He was honored by a public funeral, and a marble statue of him was placed in the pump room of the king's bath. Nash was ungainly in person, with coarse and ugly features, and

dressed in a tawdry style. A life of him by Goldsmith was published anonymously in 1762.

NASH, Thomas, an English dramatist, born in Lowestoft, Suffolk, about 1560, died in London in 1600 or 1601. He took the degree of B. A. at Cambridge in 1584, and in 1589 fixed his abode in London. The prelatists and Puritans being then engaged in a war of vituperation, Nash espoused the cause of the former, and wrote a series of pamphlets including "Pap with a Hatchet," "An Almond for a Parrot," "A Countersuffe to Martin Junior," and "Martin's Month's Minde." He aided Marlowe in writing "Dido, Queen of Carthage," and produced a spectacle styled "Summer's Last Will and Testament," which was exhibited before Queen Elizabeth in 1592. Nash's plays were ill received, and he became very poor. He described his forlorn condition in his "Pierce Penniless, his Supplication to the Divell," which appeared in 1592. He then resumed pamphleteering, and assailed Dr. Gabriel Harvey, who made a stout defence; and finally the archbishop of Canterbury ordered the publications of both to be seized. In 1597 Nash produced a satirical play called "The Isle of Dogs," the representation of which led to his confinement in the Fleet prison.

NASHUA, a city and one of the shire towns of Hillsborough co., New Hampshire, at the junction of the Merrimack and Nashua rivers, 35 m. S. of Concord, and 40 m. N. N. W. of Boston; pop. in 1870, 10,543. The streets are broad, well lighted, and lined with trees, and many of the churches and residences are handsome. Its prosperity depends upon its railroad facilities and its manufactures. The railroads meeting here are the Boston, Lowell, and Nashua; the Concord; the Nashua, Acton, and Boston; the Worcester and Nashua; the Wilton; and the Nashua and Rochester. Water power is obtained from the Mine falls in the Nashua river, from which a canal has been cut, 3 m. long, 60 ft. wide, and 8 ft. deep, with a head and fall of 36 ft. The Jackson company, with 766 looms and 22,000 spindles, produces sheetings and shirtings; the Nashua manufacturing company, with 1,800 looms and 75,000 spindles, manufactures sheetings, shirtings, prints, and flannels; and the Vale Mills manufacturing company, with 4,684 spindles, produces shirtings. There are also extensive iron works, with the largest steam hammer in the United States, soapstone works, and manufactories of bedsteads, carpets, bobbins, spools, and shuttles, cards and glazed paper, edge tools, locks, shoes, marble-working tools and implements, sash, doors, and blinds, &c. The city has two national banks and three savings banks. There are a high school and several grammar, middle, and primary schools, with an average attendance of 1,790; a city library, with about 6,000 volumes; two daily and two weekly newspapers; and 11 churches, viz.: 1 Baptist, 3 Congregational, 1 Episcopal, 2 Methodist, 2 Roman Catholic, 1 Unitarian, and 1 Universal-

ist. Nashua owes its origin to the organization of the Nashua manufacturing company in 1823. It was incorporated as a city in 1853.

NASHVILLE, a port of delivery and the capital of Tennessee, seat of justice of Davidson co., the second city of the state in point of population, situated on the S. bank of the Cumberland river, 200 m. above its junction with the Ohio, a little N. of the centre of the state, and 240 m. S. S. W. of Cincinnati; lat. $36^{\circ} 10' N.$, lon. $86^{\circ} 49' W.$; pop. in 1830, 5,566; in 1840, 6,929; in 1850, 10,165; in 1860, 16,988; in 1870, 25,865, of whom 9,709 were colored and 2,809 foreigners. The river bluffs are here rocky, and rise 70 or 80 ft. above low-water mark. The land on which the city is built is irregular, rising in gradual slopes, with the exception of Capitol hill, which is more abrupt. This eminence is symmetrical, resembling an Indian mound, and overlooks the entire city. Nashville is regularly laid out, with streets crossing each other at right angles, but mostly rather narrow. It is generally well built, and there are numerous imposing public and private buildings. One of the finest of the former is the capitol, situated on Capitol hill, and constructed inside and out of a beautiful variety of fossiliferous limestone. It is three stories high including the basement. At each end there is an Ionic portico of eight columns, each 4 ft. 6 in. in diameter and 33 ft. 5 in. high, and each of the sides has also a portico of six columns. A tower rises above the centre of the roof to the height of 206 ft. from the ground. It has a quadrangular rusticated base, 42 ft. high, surmounted by a circular cell 37 ft. high and 26 ft. 8 in. in diameter, with eight fluted Corinthian columns, designed from the choragic monument of Lysicrates at Athens. The dimensions of the whole building are 239 by 138 ft., and it cost nearly \$1,000,000. It is approached by four avenues which rise from terrace to terrace by broad marble steps. The edifice is considered one of the handsomest public buildings in the country. The court house is a large building on the public square, with an eight-columned Corinthian portico at each end, and a four-columned portico at each side. The market house, also on the public square, is a fine building. The county jail is a substantial structure of stone. The state penitentiary buildings, also of stone, occupy three sides of a hollow square enclosed by a massive stone wall, within which are numerous workshops. The Hermitage, the celebrated residence of Andrew Jackson, is 12 m. E. of Nashville. The city has several lines of street railway. It is lighted with gas, and is supplied with water by expensive works, which raise it from the river to four reservoirs. The Cumberland is navigable below this point for about nine months in the year, and to Carthage, 100 m. above, for about the same time, and for four months to Point Burnside, 260 m. above Carthage, tapping the great Appalachian coal field. At Nashville it is crossed by an

Nashville.

iron railroad bridge, with an immense draw of 280 ft., and two stationary spans, each of 200 ft., and also by a wire suspension bridge. Railroad communication with Louisville, St. Louis, Memphis, Chattanooga, Montgomery, and other points is furnished by the Louisville, Nashville, and Great Southern, the Nashville, Chattanooga, and St. Louis, the St. Louis and South-eastern, and the Tennessee and Pacific lines. These railroads and the river enable the city to command the trade of an extensive and productive region. Its business is rapidly increasing. The value of its wholesale trade in 1873 was as follows:

BRANCHES.	Value.	BRANCHES.	Value.
Cotton.....	\$4,250,000	Cigars and tobacco	\$2,000,000

Nashville has one large cotton factory, operating in 1875 400 looms and 13,840 spindles, and employing 325 hands; in 1874 it produced 2,628,907 yards, chiefly sheetings. There are seven saw mills, five flour mills, eight planing

mills and sash and blind factories, two cotton-seed oil mills, two tanneries, two manufactories of chairs, four of furniture, three of wagons, four of carriages, one of cedar ware, one of fertilizers, several of mattresses, saddletrees and trunks, brooms, shoes, and clothing, six founderies, six machine shops, two brass founderies, a brewery, distilleries, and paper mills. There are four national banks, with an aggregate capital of \$900,000, a savings bank, and three fire and three life insurance companies.—The city is divided into 10 wards, and is governed by a mayor and a board of aldermen of one member and a common council of two members from each ward. There is an efficient police force and a well organized fire department. The receipts into the city treasury for the year ending Oct. 1, 1874, were \$456,535 80; disbursements, \$461,599 11; city debt, \$1,630,506 22; assessed value of property, \$13,355,281, embracing about two thirds of the property of the city. The principal charitable and reformatory institutions are the state institution for the blind, several hospitals, two orphan asylums near the city, the city workhouse, and a house of industry for females. About 6 m. from the city is the county poorhouse, and about the same distance the state hospital for the insane. Nashville is the seat of several important educational institutions. The university of Nashville was incorporated in 1785 under the name of Davidson academy, and in 1806 as Cumberland college; it received its present title in 1826. The literary department was united in 1855 with the "Western Military Institute," and was conducted on the military plan until the breaking out of the civil war. After its close the Montgomery

Bell academy, an endowed institution, was united with it. The main building is a handsome Gothic edifice of stone. In 1873-'4 there were 9 instructors, 179 preparatory and 44 collegiate students, and a library of 11,000 volumes. The medical department, opened in 1850, also occupies a fine building; it has an extensive museum, and the charge of a mineralogical cabinet of 20,000 specimens collected by Dr. Gerard Troost. The number of instructors in 1873-'4 was 10; of students, 235. The funds and property of the university amount to \$300,000. Fisk university was established in 1866 by several northern gentlemen for the colored youth of the state. The course embraces the common and preparatory branches as well as those of collegiate grade. The number of instructors in 1873-'4 was 13; of students, 424. The Tennessee Central college (Methodist), also for colored people, was established in 1866, and in 1873-'4 had 8 professors and 28 students; it embraces academic, normal, preparatory, collegiate, and theological departments. The Tennessee college of pharmacy, organized in 1872, in 1873-'4 had 5 professors and 20 students. The buildings of Vanderbilt university, named in honor of Cornelius Vanderbilt of New York, who gave \$500,000 for its establishment, are in course of erection. It is under the control of the Methodist Episcopal church, South, and is intended to comprise theological, law, medical, and literary and scientific departments. Other educational institutions are a young ladies' seminary, a select school, and the following under the control of the Roman Catholics: St. Cecilia's academy for young ladies, St. Bernard's academy, and a parochial school. The public schools are graded, embracing a high school department, and are in a flourishing condition. The number of children between 6 and 18 years of age in 1873-'4 was 8,877; number enrolled in public schools, 3,656 (2,820 white and 836 colored); average attendance, 2,520; number of teachers, 70; total expenditures for school purposes, \$75,170 53, of which \$11,000 was for permanent improvements, and \$48,180 25 for teachers' salaries; number of school houses, 6 (4 for white and 2 for colored children); number of sittings, 3,345; value of school property, \$141,000. The state library in the capitol has 20,000 volumes and 5,000 pamphlets, and the city library 6,000 volumes. There are two daily, two tri-weekly, and eleven weekly newspapers, and nine monthly and two quarterly periodicals. There are 34 churches, viz.: 6 Baptist (3 colored), 3 Christian (1 colored), 1 Cumberland Presbyterian, 3 Episcopal, 1 German Lutheran, 2 Jewish, 5 Methodist Episcopal (1 German), 7 Methodist Episcopal, South, 4 Presbyterian, and 2 Roman Catholic.—The first permanent settlement at Nashville was made in 1779-'80, and the town was incorporated in 1784, and received a city charter in 1806. The state legislature met here from 1812 to 1815 inclusive, when it was trans-

ferred to Murfreesboro; but since 1826 it has sat at Nashville, which was made the permanent capital of the state by a legislative act of 1843. In July, 1850, a convention of delegates from several of the southern states was held in Nashville, at which secession was openly urged. In February, 1862, the city was the headquarters of the confederate general A. S. Johnston, while he was awaiting the result of Grant's operations against Fort Donelson. When tidings came that the fort had been captured the legislature was in session; it was immediately adjourned by the governor to meet at Memphis. It was Sunday; the churches were deserted, and the streets were piled up with property for removal. Johnston hastily abandoned the city, which was given over to the mob, and a scene of general plunder ensued. The Union forces moved upon Nashville, which was entered without opposition by a detachment under Gen. Buell, Feb. 26, Grant arriving the next day. Andrew Johnson was appointed military governor of Tennessee, March 5, and reached Nashville on the 12th. The common council refused to take the oath of allegiance, and were removed; the mayor was placed under arrest, and the press put under military supervision. During the ensuing summer several unsuccessful attempts were made by the confederates to regain possession of the city. In November, 1864, Gen. Thomas being in command of the Union army of Tennessee, Gen. Hood, who had succeeded Gen. J. E. Johnston and lost Atlanta, commenced an invasion of that state. Gen. Schofield, with a large Union division, fell back. He was overtaken at Franklin, 18 m. S. of Nashville, and a severe action ensued, Nov. 30. The confederates assaulted the Union intrenchments and were repulsed, losing 4,500 men according to Hood's account, or about 6,000 according to Schofield's estimate. Schofield then joined Thomas at Nashville, which was strongly fortified. Hood followed, and early in December intrenched himself in front of the Union lines. On the 15th Thomas made an attack in force and drove the enemy from their works. During the night Hood took up another position, where he was attacked by Thomas in the afternoon of the 16th. The confederates were driven off in almost total rout; but night coming on, the pursuit was suspended. It was resumed on the next day, mainly by cavalry. Hood maintained a strong rear guard, and succeeded, after several sharp skirmishes, in reaching the Tennessee river, which he crossed on the 27th. No trustworthy reports have ever been made of the losses in these actions. Thomas puts his loss in killed, wounded, and missing during the entire campaign at about 10,000. He states that he took 13,189 prisoners; the confederates lost several thousands by desertion; and their entire loss was probably nearly 25,000, besides 72 guns and a large number of small arms. For all practical purposes their

army was entirely broken up, and Hood was removed from command Jan. 23, 1865.

NASMYTH, James, a British inventor, born in Edinburgh, Aug. 19, 1808. He studied in the school of arts and at the university of Edinburgh, and was employed in London previous to settling in Manchester in 1834, when he founded an extensive establishment for the manufacture of machinery, from which he retired in 1856. He invented the steam hammer, the steam pile driver, and a new and effective kind of ordnance, and constructed powerful telescopes for investigating the moon. In conjunction with James Carpenter, he published "The Moon considered as a Planet, a World, and a Satellite" (2d ed., 1874).

NASO, a town of Sicily, in the province and 40 m. W. S. W. of the city of Messina; pop. about 8,000. It is celebrated for its picturesque situation and its mediæval appearance. It contains fine buildings, and the trade is active. In the vicinity are ferruginous springs. Some authorities identify Naso with the ancient Agathyrnum or Agathyrna, but the site of the latter town is also assigned to another locality, and is altogether doubtful.

NASR-ED-DIN, shah of Persia, born in 1829. He succeeded to the throne on the death of his father, Muhammad, Sept. 10, 1848. The principal events of his reign are his successful contests with some of the neighboring tribes; his defeat in the war with England (1856-'7); a famine which broke out in 1871, and desolated a large portion of the country; and his visit in 1873 to European courts, the Russian and British cabinets both attempting to secure his good will. While in England he made concessions to Reuter for establishing railways and canals and working mines in Persia; but differences arose between the contracting parties, and nothing has yet been effected (1875). The shah wrote a curious diary of his European tour, which was translated verbatim into English by J. W. Redhouse (London, 1874).

NASSAU, formerly a German duchy, bounded by the Prussian provinces of the Rhine and Westphalia, by Hesse-Darmstadt, Hesse-Cassel, Hesse-Homburg, and Frankfurt; area, 1,808 sq. m.; pop. in 1866, 468,311. It now forms the S. W. part of the Prussian province of Hesse-Nassau, including the beautiful valley of the Lahn, between the Taunus range in the southeast and the Westerwald in the northwest; the towns of Wiesbaden (the former capital), Diez, Dillenburg, and Herborn; the watering places Ems, Selters, and Schwalbach; and the renowned vineyards of Johannisberg, Hochheim, Rüdesheim, and Asmannshausen.—In Germanic antiquity Nassau was inhabited by various tribes of Alemanni. After their incorporation with the Frankish empire various families rose into prominence, among which was that of Laurenburg or Lurenburg. Walram I. (died in 1020) was by his two sons, Walram II. and Otho, the founder of two lines, the older of which subsequently assumed the

title of counts of Nassau, after a small rural settlement of that name, which is mentioned in a public record as early as A. D. 794. The younger son became by marriage with the heiress of Gelderland the founder of the Guelldrian line, and from the latter are descended the Dutch princes of Orange, hence called of Nassau-Orange. Walram IV., of the elder line, was the father of Adolphus of Nassau, who was king of Germany from 1292 to 1298. The grandsons of the latter, Adolphus II. and John I., and their successors divided their inheritances into several branches, which were eventually reunited by Louis II., who died in 1625. His sons again divided the house of Nassau into several branches, of which that of Nassau-Weilburg was the more immediate source of the German line of dukes, who acquired their new dignity by joining the confederation of the Rhine (1806). After the fall of Napoleon, the German possessions of the Nassau-Orange line were acquired by the dukes of Nassau in exchange for territory ceded by them to Prussia. They also acquired at that time the hereditary right to the succession of Luxemburg, which however they sold to Holland in 1839 for about \$350,000. In the war of 1866, Nassau sided with Austria, was occupied by Prussian troops in July, and by the decree of Sept. 20, 1866, was annexed to Prussia. The last duke, Adolphus (born July 24, 1817), succeeded his father in 1839, and after his dispossession took up his residence in Frankfort, where he still resides (1875).

NASSAU, the N. E. county of Florida, bordering on the Atlantic, separated from Georgia on the N. and N. W. by St. Mary's river, and bounded S. by the Nassau river; area, 610 sq. m.; pop. in 1870, 4,247, of whom 1,970 were colored. It has a level surface and sandy soil. Amelia island, included in the county, occupies the whole of the coast. The county is traversed by the Florida railroad. The chief productions in 1870 were 24,058 bushels of Indian corn, 17,614 of sweet potatoes, 1,900 lbs. of rice, 984 of wool, and 4,198 gallons of molasses. There were 8,133 cattle, 777 sheep, and 3,447 swine. Capital, Fernandina.

NASSAU, an island in the Pacific ocean, in lat. 11° 30' S., lon. 165° 30' W., discovered by Capt. Sampson, of the American whaler whose name it bears, in 1835. It is low and apparently uninhabited, but wood and water are plentiful. It is supposed to be identical with Danger island, which an English whale ship so called reported in 1848 to be in lat. 11° 35' S., and lon. 166° 45' W.

NASSAU, a city, capital of the island of New Providence, of the Bahama group, in lat. 25° 5' N., lon. 71° 21' W.; pop. about 9,000. The town is well laid out, has a library and museum, and its salubrious climate makes it a winter resort for invalids. In 1872 the entrances were 43 steamers of 57,910 tons, and 196 sailing vessels of 20,104 tons; clearances, 43 steamers of 57,910 tons, and 186 sailing vessels of

18,950 tons; imports, \$911,582; exports, \$1,446,456, including cotton \$915,297, pineapples \$252,332, and sponge \$91,953. A falling off of \$558,567 from the imports of 1871 is due to a decrease in the number of wrecks. The increase in exports over 1871 was \$456,627. Wrecking, formerly extensively followed, is now much less profitable, and more attention is paid to agriculture. The French and Spaniards destroyed Nassau in 1703. It was rebuilt in 1718, fortified in 1740, and declared a free port in 1787. It was made a bishopric of the church of England in 1861. During the American civil war Nassau was a resort for blockade runners.

NASSAU (or Poggy) ISLANDS, two islands off the W. coast of Sumatra; pop. about 1,000. The northern island is situated between lat. $2^{\circ} 32'$ and $2^{\circ} 52'$ S., and the southern between $2^{\circ} 50'$ and $3^{\circ} 20'$ S.; they are separated by a narrow strait, and both are included between lon. $99^{\circ} 37'$ and $100^{\circ} 41'$ E. They consist of high steep hills, covered with timber of very large size, and well suited for masts and spars. Coconuts abound, and pepper is cultivated. The sago tree constitutes the chief article of food. The natives are divided into small tribes, each tribe living in one village.

NASSAU HALL. See PRINCETON.

NASSICK, or **Nashik**, a town of British India, in the province and about 100 m. N. E. of the city of Bombay, capital of a collectorate of the same name (pop. in 1872, 672,791), on the Godavary river and the Great India Peninsula railway; pop. about 25,000. It is celebrated for its Brahmanical temples and Buddhist excavations. Its proximity to the sources of the Godavary, and the legendary associations of the place, render it extremely sacred in the estimation of the Hindoos, who come as pilgrims to Nassick in large numbers. Their wealthy and numerous black basalt temples line both banks of the river. In the vicinity of the town, about 5 m. distant, are the Buddhist rock caves, which are believed to have been excavated in the 2d or 3d century of our era. There are more than 13 apartments, one of which is 45 ft. square, profusely ornamented with sculptures and colossal stone figures.

NAST, Thomas, an American artist, born in Landau, Bavaria, Sept. 27, 1840. He came to the United States in 1846, and at the age of 14 found employment as a draughtsman on "Frank Leslie's Illustrated Paper." In 1860 he went to England to illustrate the Heenan and Sayers prize fight, his sketches appearing in the "New York Illustrated News." Immediately afterward he went to Italy to follow Garibaldi, entered Naples with him, was present at the sieges of Capua and Gaëta, and executed sketches of the war for the "New York Illustrated News," the "Illustrated London News," and *Le Monde Illustré* of Paris. Returning to New York, he began in July, 1862, a series of war and political sketches in "Harper's Weekly," and since then has been one of the principal artists on that journal. In

1866 he executed for the *Bal d'Opéra* in New York 60 caricatures of prominent politicians, editors, artists, and actors. Some of these pictures measured 3 ft. by 4, others 4 ft. by 6, and all of them were painted in water colors in 30 days. In 1873 he appeared as a public lecturer in leading cities throughout the United States, illustrating his lectures by caricatures drawn on the stage. Among some of his best known sketches in "Harper's Weekly" are "Santa Claus in Camp" and "Christmas Eve" (1863); "New Year's Day North and South" (1864); "President Lincoln entering Richmond" (1865); and an extended series of political pictures. He illustrated "The Tribute Book" and Nasby's "Swinging round the Circle;" contributes a cartoon and other illustrations every month to the "Phunny Phellow;" and has issued annually since 1872 "Nast's Illustrated Almanac."

NASTURTIIUM, the generic name of a plant of the *crucifera* or mustard family, and the common name of the widely different genus *tropæolum*. The genus *nasturtium* (Lat. *nasus tortus*, a tortured nose, some of the plants being exceedingly pungent) includes among other plants the well known water cress and horse radish, both of which are described under their proper titles. The old herbalists, who classified plants by their sensible properties rather than by their structure, finding the species of *tropæolum* to possess a pungency similar to that of the cruciferous plants, included them under *nasturtium*, a name which in this or its altered form of sturition they have retained, in spite of the fact that the books give Indian cress as their suitable common name. In the most recent revision of genera *tropæolum* (Gr. *τροπαιον*, a trophy, the leaves of some resembling a shield, and the flowers a helmet) is placed in the *geraniaceæ*; it includes tender South American herbs, most of which climb by means of their long leaf stalks, and have a pungent watery juice with the taste and odor of cress. There are about 35 species, most of which are in cultivation, besides numerous garden varieties. Some are treated as garden annuals, others as greenhouse plants; a number of the species produce tubers. The flowers consist of five sepals, united at the base and extended at the upper side of the flower into a long spur; petals five or fewer, usually with claws, the upper two somewhat different from the others and inserted at the mouth of the spur; stamens eight, unequal; ovary three-lobed with a single style, and in fruit forming three fleshy separate carpels. The common garden *nasturtium* (*T. majus*) is one of the most generally cultivated annuals; the stem climbs 6 or 8 ft., and is often planted near fences, or provided with brush, which it soon covers with its peltate foliage; the flowers vary from yellow to orange, scarlet, and crimson; the three lower petals have longer claws than the others, and are fringed at the base. There is a double variety, and dwarf forms which do

not climb. The unexpanded flower buds, and the young fruit while still tender, are pickled in vinegar; and the French, who call the plant *capucine*, use the gay-colored flowers to ornament salads. The dwarf varieties of this form bushy rounded tufts about a foot high,

Dwarf Nasturtium (*Tropæolum minus*).

and are used for bedding; some of the named varieties have flowers of exceedingly rich colors. The smaller nasturtium (*T. minus*) has smaller flowers, with petals pointed at the tip, and smaller seeds; but it is so mixed up with the dwarf forms of the preceding that the true species is rarely met with. The canary-bird flower (*T. peregrinum*) is one of the most interesting of garden climbers, and very unlike the others; it climbs high and spreads rapidly; its leaves are five- to seven-lobed, and its small flowers have the two upper petals cut-lobed,

Canary-Bird Flower (*Tropæolum peregrinum*).

the lower ones fringed, and the spur curiously curved; when partly expanded the flowers may be fancied to resemble a little bird, an appearance which is aided by the lively canary-yellow color of the petals. It is an easily cultivated annual, which like the others is more produc-

tive of flowers in rather poor than in rich soils. The tuberous nasturtium (*T. tuberosum*) has red and yellow tubers the size of a small pear, five-lobed leaves, short orange-colored petals, and an orange-red calyx with a heavy spur. This is the *ysano* of the Peruvians, with whom it is held in high esteem as an article of food; and it has been introduced into Europe and this country as a garden vegetable, but has met with little favor. In South America the tuber is first boiled and afterward frozen, and is eaten in the frozen state. The tubers are preserved and propagated in the same manner as potatoes. Lobb's nasturtium (*T. Lobbianum*) is a favorite greenhouse climber, but it does not flourish so well in the open air as the common species, which it much resembles; it has smaller and slightly hairy leaves, and much fringed flowers, which in the many named varieties present a great diversity of color. Among the tuberous-rooted greenhouse species are *T. tricolorum*, with scarlet and black flowers; *T. azureum*, blue and white; and *T. Jarattii*, carmine and yellow. They are summer-flowering, and remarkable for the exceeding delicacy of their stems, which near the tuber are scarcely larger than a thread; they are trained upon low trellises, while *T. pentaphyllum*, also tuberous, can be trained to pillars and rafters. All the *tropæolums* are raised from seed, which in some is very slow in germinating, and those with fleshy stems grow readily from cuttings.

NATAL, a British colony in S. E. Africa, N. E. of Cape Colony, from which it is separated by Caffraria along the coast. It lies between lat. 27° 30' and 31° 30' S., and lon. 28° 30' and 32° E., and is bounded N. E. by the Buffalo and Great Tugela rivers, beyond which is the Zooloo country, S. E. by the Indian ocean, S. and S. W. by Caffraria, and W. and N. W. by the Drakenberg range, with the Orange River Free State on the opposite slope; length about 250 m., breadth between the sea and the mountains 150 m.; coast line 170 m. long; area, according to the British parliamentary accounts of 1872, 16,145 sq. m.; pop. 250,852. In 1869 the number of whites was 17,821, and of Indian coolies introduced as agricultural laborers 5,227, but the native Zooloos make up the bulk of the population. Many of the 16 districts into which the colony is divided have been but partially explored. Pietermaritzburg, the capital, in lat. 29° 35' S., lon. 30° 20' E. (pop. in 1869, 6,192), and D'Urban, the colonial port, about 50 m. distant (pop. 5,708), are the principal towns; while villages of various sizes are scattered over the colony. D'Urban is situated upon the coast, on the N. side of Port Natal, a circular basin about 10 m. in circumference, communicating with the sea by a narrow channel. This is the only harbor of any importance, and efforts have recently been made to improve it. The country rises from the coast in a series of terraces to an elevation of between 3,000 and 4,000 ft.,

at the base of the Drakenberg, and presents many varieties of climate, soil, and scenery. Along the Indian ocean is a belt of undulating or hilly land about 25 m. broad, producing sugar, coffee, cotton, tobacco, and many other tropical plants, together with the mulberry, olive, vine, oats, beans, potatoes, and Indian corn, and diversified with occasional tracts of forest. Succeeding this belt is a higher tract displaying the productions of a temperate climate; still further inland is a fine grazing district, and back of this a succession of hills extending to the foot of the Drakenberg division of the Quatlamba mountains, which rises abruptly like a wall to a height of 8,000 ft. above the sea, and nearly 4,000 ft. above the country at its base, and over which there are but two practicable passes. Several offshoots of this range approach the coast. The climate is exceedingly pleasant and healthful. In the neighborhood of the coast the weather is warm, the average temperature being about 74° in summer and 63° in winter; but in the elevated districts it is much cooler. The rainy season continues from March to the end of September, during which violent thunder storms are frequent. The grazing country produces abundant crops of wheat, oats, and other cereals of the temperate regions, and excellent apples, pears, walnuts, peaches, apricots, and nectarines. From the coast upward the whole is well watered by numerous streams and several considerable rivers, none of which are navigable. All the rivers are low in the dry season, but become full in a few hours in rainy weather, and rush down like torrents. Along the coast the soil is sandy, with masses of volcanic rocks and sandstone interspersed. The high lands are composed of stratified sandstone, with a vein of granite running in a N. E. direction; and the soil is mostly a friable loam. The coast line, extending from high-water mark 5 or 10 m. inland, has proved to be well adapted to the cultivation of cotton, which has been raised in the colony since 1866, and now forms an important article of export. But little definite scientific knowledge yet exists as to the mineral resources of Natal. Coal deposits of good quality are said to exist in the Tugela valley; iron ore occurs in many places; copper has been discovered; beds of limestone are known to exist; and small quantities of gold have been obtained in the vicinity of D'Urban. The number of the larger wild animals in the colony is diminishing. The elephant is met with in the remote forest districts, and the hippopotamus frequents some of the eastern rivers. The fauna also includes the leopard, hyæna, buffalo, eland, several other varieties of antelope, the crocodile, and a number of snakes, some of which are venomous.—The native Zooloo population, belonging to the same ethnological family as the Caffres, are a pastoral people and disinclined to agricultural pursuits, in which however, under European influence, they have extensively en-

gaged. They are remarkable for their honesty and peaceable disposition. In 1871 the total number of acres under crops and grass was 175,355, of which 106,800 were devoted to the growth of maize. Of sugar, which is one of the principal products, 7,661 tons, valued at £159,430, were exported in the crop season of 1870-'71, as against 857 tons, valued at £21,286, in that of 1860-'61. In 1870 there were 1,014,210 lbs. of coffee raised, while the product for 1869 amounted only to 4,058 lbs. Sheep are raised in large numbers, and the value of the wool exported exceeds that of any other article, amounting to £140,597 for 4,814,710 lbs. in the first nine months of 1871. The total value of the exports in 1870 was £382,979, comprising the following principal articles in the order of value: wool, raw sugar, hides, ivory, butter, ostrich feathers, arrowroot, cured meat, raw cotton, and grain. The imports for the same year were valued at £429,527, and included cotton, woollen, and leather manufactures, ironmongery, flour and meal, coffee, rice, and linen. Since the discovery of diamonds near the Vaal river, large numbers of these gems have been exported through Natal; but it has proved difficult to ascertain the aggregate value, as many of them are carried away without any declaration to the authorities. In 1870 the value of the diamonds exported through the D'Urban custom house was £9,615; in the first 10 months of 1871 it was £32,056. Exclusive of coasters, the tonnage of vessels entered at the ports of Natal in 1870 was 23,881, and of those cleared 24,005.—In 1870 there were 79 schools sustained wholly or partially by the government, with an average attendance of 1,797 pupils. Of these, 4 were classed as government schools, including high schools at Pietermaritzburg and D'Urban, 65 as aided schools, and 10 as itinerant schools. The school system is under the control of a superintendent of education. Excellent schools are also maintained by missionaries in various parts of the country, prominent among which are the American mission schools in the coast range, and those of the church of England and of the Wesleyan church. At Pietermaritzburg there is a central training school belonging to the Free church of Scotland. The colony was made a diocese of the Anglican church in 1853, and is also the seat of a Roman Catholic bishop. The American mission is composed chiefly of Presbyterian and Congregational ministers; in 1870 it maintained 19 stations and out stations, with 12 churches, having about 500 native members.—In the government of Natal, the crown retains the right to veto colonial legislation, and the public officers remain under the control of the home government. The executive authority is vested in a lieutenant governor, who is assisted by an executive council of 8 and a legislative council of 16 members. The colonial secretary, the treasurer, the attorney general, and the secretary for native

affairs belong *ex officio* to both. The 12 additional members of the legislative council are representatives from the counties and boroughs, elected by voters possessing freehold property worth £50, or occupying house or land at a rent of £10 a year; all voters are eligible to membership. Two of these representatives, designated by the lieutenant governor, together with the chief justice and the senior officer in command of the troops, constitute the four additional members of the executive council. The judicial system comprises a supreme court with three justices, sitting at Pietermaritzburg, and local courts and magistrates in the several counties. In 1871 the revenue, derived from customs, land sales, stamps, a native hut tax, and other sources, amounted to £180,498, and the expenditure to £132,978. There is a public debt of £263,000. The military expenses, with the exception of about £4,000 per annum, are borne by Great Britain; they were £39,188 in 1869, of which the colony provided £4,272, besides expending £1,061 for its volunteer forces. There is telegraphic communication between D'Urban and the capital, and a project for the construction of 345 m. of railway has been approved by the government.—The Portuguese discovered the coast of Natal on Christmas day, 1497, and named it in honor of the day. It was visited and favorably reported upon, toward the close of the 17th century and later, by Dampier, Woodes Rogers, and several Dutch navigators. Subsequently a Dutch expedition purchased the territory from some native chiefs. Its actual colonization, however, was not projected till 1823. In that year Mr. Thomson, a merchant of Cape Town, and Lieuts. Farewell and King of the English navy, in the course of a trading voyage to the E. coast of Africa, put into Natal harbor. In 1824 Lieut. Farewell, having visited it again, obtained from the chief of the Zooloos, who had conquered the country, a grant of land around Port Natal, where he hoisted the British flag and took possession. In 1834, in consequence of an application to the governor of the Cape of Good Hope from the Zooloo chief for a white settlement to be formed at Natal, a few emigrants proceeded from that colony. In 1835 the American missionaries commenced operations in the territory; but nothing was done on a large scale till about 1837, when the Dutch farmers who were dissatisfied with the British rule in the Cape Colony ascended to the sources of the Orange river, and found their way across the Quatlamba mountains under the leadership of Pieter Retief, who became engaged in a contest with the chief of the Zooloos and was slain, together with many of his followers. The remainder, led by Andries Willem Pretorius, defeated the Zooloo chief in the following year, and founded Pietermaritzburg with a view to make it the capital of their settlement, which they called the republic of Natal, delegating the necessary powers of govern-

ment to a council of 24 with a president at their head. The men capable of bearing arms were enrolled as militia-subject to the council. When the English government, in 1845, declared the British sovereignty to extend over Natal, and sent a military expedition to take possession of the country, after some resistance the more resolute of the emigrants, under Pretorius, abandoned the territory. Natal remained subordinate to the government of Cape Colony till 1856, when it was constituted a separate and distinct colony. In 1873 a conflict with the Ama-Hlubi tribe, numbering about 10,000, charged with the illegal possession of unregistered firearms, resulted in the killing of about 200 of them, the transportation of as many more, including their chief Langalibalele, and the outlawry of the whole tribe.

NATCHEZ, a tribe of North American Indians, known to Europeans from 1560, when Tristan de Luna aided the gulf tribes against them. With the Tensas, a kindred tribe, they held a tract on the E. bank of the Mississippi. According to their traditions, they came from the southwest, in consequence of wars with ancient inhabitants, and made a stand on the seacoast, where a part remained, while others pushed on to the spot where they were found. Their language, sabæism, and mound building connect them with the Mayas of Yucatan. La Salle reached their country in March, 1683, and planted a cross. Iberville also visited them, and proposed to build a city there. They were mild and friendly, brave, though preferring peace to war, and very dissolute. They were governed by the Great Sun, descended in the female line from a man and woman, their first civilizers, who came down from the sun, and first built the temple for perpetual fire, which was always afterward maintained. This temple was on a mound 8 ft. high, with a pitched roof, and contained the bones of the suns and three logs slowly burning under the care of appointed guardians. The cabin of the sun was on a similar mound, but with rounded roof. His power was despotic, as was that of his sister and immediate kindred. He was never approached without special marks of reverence. Next to the suns were the nobles, while the Michemichiquip, called Puants by the French, formed the common people, and were evidently of the Choctaw race. They used bows and arrows, but had no metals, dressed in buffalo robes, and made feather robes for winter, and others for summer of the bark of the mulberry and of flax. They had many feasts, and on the death of a chief killed many to attend him. The dead were kept on raised platforms till the flesh was consumed. They rapidly declined after the appearance of the French and of English traders, who about the same time reached them. La Mothe Cadillac in 1715 refused the calumet, and they killed some Frenchmen; but Bienville in 1716 compelled them to give up the murderers, and built a fort there.

Hostilities were renewed in 1722, but Bien-ville burnt the Apple village and again compelled them to punish the guilty. In 1729 the tyranny of Chopart, who wished the site of one of the villages for his own use, led to a conspiracy in which apparently the Choctaws and Chickasaws were engaged. On Nov. 28 the Natchez began a general massacre of the French, killing all the men except 20 who escaped and two or three kept for service; a few women were killed, but most were kept as prisoners, and the negro slaves were adopted. Their kindred Tensas had disappeared before 1712 as a distinct tribe, and do not appear in these troubles; but the Yazooos and Chickasaws joined the Natchez, while the Choctaws joined the French and were first in the field. Lesueur, a Canadian officer, raised a large Choctaw force, and marching into the Natchez territory attacked the enemy Jan. 27, 1730, killed 80, and recovered many captives and slaves. The chevalier de Loubois soon after came up with the colonial troops that had been raised at New Orleans, moved slowly up the Mississippi to the Tonicas, and after some delay finally on Feb. 13 besieged the Natchez forts. He showed little vigor, and after obtaining the remaining captives allowed the Natchez at the end of February to escape. The fugitives in their flight cut off French parties, and at last made a stand on Black river, west of the Mississippi. Gov. Perrier on Jan. 25, 1731, reduced this fort and captured the sun, his brother and nephew, next in succession, 40 warriors, and

387 women and children. These were sent to Santo Domingo and sold as slaves. The remnant of the nation, more furious than ever, fled to the Chickasaws, after killing many of the Tonicas and attacking the Natchitoches, where they were repulsed with heavy loss by Saint-Denis. But in spite of this repulse they with the Chickasaws kept up the war, and the French attempting to punish the Chickasaws were repulsed, and at last patched up a peace in 1740. The Natchez never again appeared as a distinct nation. After a time they moved to the Muskogees, and in 1835 were reduced to 300 souls, retaining their own language and line of suns, but without restoring their temple or worship.—For their language the only materials are the words preserved by Le Page du Pratz and other French writers, and a vocabulary taken by Gallatin in 1826 from the chief Isahlakteh. Dr. Brinton traced the analogy between it and the Maya.

NATCHEZ, a city, port of entry, and the capital of Adams co., Mississippi, the second city in the state in population, situated on the E. bank of the Mississippi river, 279 m. above New Orleans and 116 m. below Vicksburg by water, and 85 m. in a direct line S. W. of Jackson; lat. 31° 34' N., lon. 91° 25' W.; pop. in 1850, 4,434; in 1860, 6,612; in 1870, 9,057, of whom 5,329 were colored. It is built on the summit of a bluff 150 ft. above the water, and on the narrow strip of land between the foot of the hill and the river. The latter portion of the city, called Natchez Landing or Natchez-

Natchez-on-the-Hill.

under-the-Hill, has some important business houses, but can make no claim to beauty. It communicates by broad and well graded roads with the upper quarters (Natchez-on-the-Hill), which are beautifully shaded and contain many handsome residences and other buildings. The streets are regular, lighted with gas, and generally gravelled in the roadway. The houses are principally of brick, and the residences are

adorned with gardens. The brow of the bluff along the whole front of the city is occupied by a park. The principal buildings are the court house, in a public square shaded with trees, the masonic temple, the Catholic cathedral, with a spire 182 ft. high, the Episcopal church, and the Presbyterian church, with a spire containing a clock. The city hall and market house are immediately back of the

court house. In the suburbs there were formerly numerous residences of wealthy planters, expensively furnished, and surrounded with beautiful lawns and gardens; but many of these were destroyed in the civil war. On the bluff, adjoining the city, there is a national cemetery, handsomely laid out and decorated. The climate of Natchez is pleasant and very salubrious. The winters are temperate, though variable, and the summers are long and equable; the thermometer seldom rises above 90°. The business is mainly in cotton, which is brought to this market from the adjoining counties, and in the supply of provisions and implements for the neighboring plantations. From 13,000 to 20,000 bales of cotton are annually shipped to New Orleans. Regular lines of steamers connect with New Orleans, Vicksburg, and Memphis, and a stage line runs to Brookhaven on the New Orleans, Jackson, and Great Northern railroad, 60 m. E. There are a Protestant and two Roman Catholic orphan asylums, and a city hospital. The United States marine hospital is situated between the city and the national cemetery. There are several Roman Catholic schools, and good public schools, attended by about 1,000 pupils. Of the two school buildings, one is a handsome structure recently erected for colored children, while the "Natchez institute" for whites was used as a free school before the civil war. A daily and two weekly newspapers are published. The city contains eight churches, viz.: Baptist (2), Episcopal, Jewish, Methodist (2), Presbyterian, and Roman Catholic, besides several for colored people.—The site of Natchez was selected by a party sent by Le Moyne d'Iberville in 1700 as the chief place of a number of proposed settlements in the lower Mississippi territory, and the name of Rosalie was given to it in honor of the countess of Pontchartrain, whose husband had been one of Iberville's patrons. No settlement was made however until 1716, when Bienville, Iberville's brother, built Fort Rosalie on Natchez bluff. In November, 1729, the fort and adjacent settlements were destroyed by the Natchez Indians and the inhabitants massacred; but a few months later a force of French and Indian allies drove out the Natchez and rebuilt the fort, which continued to be a French military and trading post until it passed into the hands of Great Britain by the treaty of 1763. It was now called Fort Panmure. In 1779 it was occupied by the Spaniards, who kept possession of it until March, 1798, although by the treaty of 1783 it was rightfully included in the territory of the United States. In April, 1798, the territory of Mississippi was created by act of congress, and Natchez became its capital. It was incorporated as a city in 1803. In 1820 the seat of government was removed to Jackson. In 1840 a large part of the city was laid in ruins by a tornado. During the civil war Natchez was captured, May 12, 1862, by a portion of Farragut's fleet. It had never been

occupied by any considerable force of the confederates, and being of little military importance was soon abandoned by the Unionists.

NATCHITOCHES, a tribe of American Indians, allied to the Caddoes, and formerly residing on Red river, Louisiana, with a fortified town on an island. The Washitas and Capichis were united with them. They worshipped the sun, had a temple with perpetual fire, and made salt at a neighboring lake, which they traded to other tribes for grain and skins. They were always friendly to the French, who planted a fort near them. This led to an attack on them by the fugitive Natchez in 1731. They gradually united with the Caddoes, forming a band of that tribe.

NATCHITOCHES, a N. W. parish of Louisiana, intersected by Red river and bounded E. by a branch, Saline bayou; area, 2,260 sq. m.; pop. in 1870, 18,265, of whom 10,929 were colored. It has a level surface and fertile soil, especially near the rivers. The chief productions in 1870 were 231,746 bushels of Indian corn, 12,356 of sweet potatoes, 15,671 bales of cotton, and 3,189 lbs. of wool. There were 2,949 horses, 1,845 mules and asses, 3,527 milch cows, 1,644 working oxen, 8,952 other cattle, 5,442 sheep, and 10,244 swine. Capital, Natchitoches (pop. in 1870, 1,401), a shipping point on Red river, about 500 m. by water N. W. of New Orleans.

NATICK, a town of Middlesex co., Massachusetts, on the Boston and Albany railroad, at the junction of the Saxonville branch, 17 m. W. by S. of Boston; pop. in 1870, 6,404. Charles river flows through the S. E. portion, and Cochituate lake, which supplies Boston with water, is partly within the town. Farming is carried on to some extent, but the principal business is the manufacture of boots and shoes, for which there are 15 or 20 establishments. There are also a hat factory and a base-ball manufactory. The town has a national bank, a savings bank, water and gas works, a fine public library and library building, a high school, a weekly newspaper, and eight churches. Natick was incorporated in 1781. The first Indian church in New England was erected here in 1660, on the site now occupied by the Unitarian church. John Eliot preached here, and in the cemetery is a monument to his memory.

NATIONS, Law of. See LAW OF NATIONS.

NATRON. See SODA.

NATURAL BRIDGE. See BRIDGE, NATURAL.

NATURAL HISTORY, strictly speaking, the history of universal nature or of all natural objects, their qualities and forces, their laws of existence, their origin (as far as possible), and their mutual relations to each other and to man. The study of the physical forces of nature, however, has been separated into distinct branches of science, under the names of natural philosophy, chemistry, astronomy, &c.; leaving for natural history proper the investigation of the structure, properties, and uses of the inanimate bodies called minerals, and of

the various kinds of living things, both animal and vegetable, including their description, collection, preservation, determination, and arrangement in a natural series, and embracing as principal divisions zoölogy, botany, and mineralogy. For details on these divisions, see the articles ANIMAL, BOTANY, COMPARATIVE ANATOMY, GEOLOGY, MINERALOGY, PHYSIOLOGY, ZOÖLOGY, and the various animal and vegetable classes in their respective order.

NATURALIZATION, the act of investing an alien with the rights and privileges of a native-born citizen or subject. It is of two kinds, collective and personal. A collective naturalization takes place when a country or state is incorporated in another country by gift, cession, or conquest. Thus, when England and Scotland were formed into one kingdom in the reign of Queen Anne, it was declared by the fourth section of the act of union that subjects of the United Kingdom possessed thereafter all the rights, privileges, and advantages enjoyed by the subjects of either kingdom; and when Louisiana was ceded by France to the United States in 1803, it was provided by the third article of the treaty that its inhabitants should be entitled to all the rights and privileges of citizens of the United States; and a similar effect took place when the republic of Texas was annexed to and formed into one of the states of the American Union. Personal naturalization is where the privileges of a subject or citizen are conferred upon an individual by the license or letters patent of a sovereign or the act of a legislative body, or are obtained by the individual himself under a general law, upon his complying with certain conditions prescribed by the law.—Naturalization was practised among the states of antiquity, and is found in the rudest forms of human society. The North American Indians frequently adopted Europeans, and more frequently members of other tribes taken in war. The earliest account that we have of naturalization is among the Jews. It formed a part of their early legislation, as embodied in the books of Moses. The knowledge we possess of the laws or customs of the great contemporary nations, the Egyptians, Assyrians, Babylonians, Phœnicians, and Persians, is too limited to enable us to know with certainty the policy they pursued upon this subject.—In Greece, during the heroic ages, the people had few or no privileges, and whatever was allowed to them appears to have been as freely extended to strangers. In the convulsions which followed these ages, naturalization was readily granted; but as the different states settled down into compact and well organized communities, the value of citizenship became enhanced, and the privilege was more sparingly bestowed. In Athens, so far as can be gathered from the fragmentary information that has descended to us, there would seem to have been three kinds of naturalization: 1, the admission of an alien to membership in a deme or township by the vote of its inhabitants, at

their convocation or general meeting, and the inscribing of his name upon the lexiarchic register, or roll of the qualified citizens of the deme, kept by the demarch; 2, citizenship conferred by the state as a mark of distinction upon foreigners eminent for their virtues or talents, or who had rendered important services to the republic; 3, privileges, more or less qualified, extended to the inhabitants of other states, or to particular persons. By the laws of Solon, none but those who were banished from their country for ever, and had with their families taken up their permanent abode in Attica, with the intention of practising some trade or profession, could be enrolled in the list of citizens. Afterward, however, the practice arose of bestowing citizenship as the gift of the state. It was conferred as an honorary distinction upon foreigners, admitting them to every privilege except that of holding the office of archon or priest, and did not imply the necessity of residence; but whether it entitled them to vote in the assembly is a point upon which authors are divided. The admission of aliens as members of a deme, which was the ordinary or general mode of naturalization, was very limited at first, as the Athenians, in common with the other Grecian states, placed a high value upon citizenship, and were suspicious of and prejudiced against foreigners. When Clisthenes made a new division of the tribes, in 509 B. C., and of their subdivision into demes or local parishes, townships, or cantons; he, with a view of strengthening these separate political communities, added new citizens, among whom were included not only resident foreigners and strangers, but even slaves. It was not intended as a precedent, but was a temporary expedient to enable him to carry out more effectually his plan for the division of the people into local communities. The innovation, however, was followed by the gradual extension of a more liberal feeling in regard to aliens. There was constantly at Athens a large body of resident foreigners, attracted there either by commercial pursuits, or a wish to profit by the instruction of its schools, or the love of amusement. This class, embracing persons from all parts of Greece and from other countries, were known, in contradistinction to transitory strangers or mere sojourners, by the appellation of *metœci*, and were under many disabilities. They could not acquire landed property, and if engaged in industrial pursuits, they were subject to a heavier tax than the citizens. They were compelled to select a patron as the mediator between themselves and the state in the transaction of all legal business, who was answerable for their good conduct. They were obliged, like the citizens, to serve in the army or navy when the exigencies of the state demanded it, and occasionally compelled to perform degrading services, which were rather symbolical acts, designed to remind them of the inferiority of their relation to the citizen. Upon the payment of the tax imposed,

they were allowed to engage in trade and commerce; and nearly all commercial business was in their hands. To this class, who had made Athens their permanent abode, it was of the greatest importance to be admitted members of a deme, as it released them from a burdensome tax, enabled them to acquire land, to inherit, and generally to enjoy the privileges of citizens, except that of holding the office of archon or priest. So strong was this desire, that they were occasionally induced to get their name surreptitiously entered upon the register of a distant deme; for a citizen was not obliged to reside in the one in which he was enrolled, and there were at least one hundred of these distinct commonalties distributed over Attica; but if the fraud was discovered, the alien was liable upon conviction to be sold as a slave. Themistocles exerted himself strongly in favor of this class, and chiefly through his influence their admission into the demes was greatly facilitated, and it afterward became more general. When the number of the citizens was greatly diminished by war, the loss was supplied by the admission of the resident aliens or *metœci*. After the disastrous defeat at Syracuse, which nearly depopulated the state, the ranks of the citizens were recruited by naturalizing the *metœci*. The lexiarchic registers were filled with these names, and the naturalization was so extensive as nearly to abolish all distinction. The loss of citizens was again supplied in this way after the battle of Chæronæa; and perhaps no state, in proportion to its population, ever naturalized so many aliens. It was the fixed policy of the Spartans, and the peculiar aim of their institutions, to retain to themselves and to their descendants the exclusive exercise of political power; and so rigidly was this policy pursued, that Herodotus declares that but two instances had occurred in which they had admitted foreigners to the full franchise. After the time of Herodotus, foreigners were occasionally admitted, and it is after this period that helots are supposed to have been raised to this dignity. Upon the revolution effected by Cleomenes, and the reconstruction by him of the constitution of the state, he admitted a considerable number of new citizens. They were selected from among the most worthy and deserving of the population, and embraced natives of Laedæmon, *Periœci*, and strangers, all of whom were admitted to the full franchise. (See SPARTA.)—In Rome citizenship, or the Roman burgess right, was originally limited to the patricians. It was at first sparingly bestowed on distinguished foreign clans, after their emigration from their homes or after the conquest of their cities; but such grants became more rare as the privilege increased in value. During the republic citizenship was conferred by a vote of the senate upon aliens who had rendered eminent services to the state, of which several striking examples are mentioned by the Roman historians. After the social or Marsic war, 90 B. C.,

the right was extended to all the people of Italy. Under the emperors, down to the reign of Caracalla, foreigners petitioning for citizenship were naturalized by an imperial decree; but under a constitution promulgated by Caracalla, all the free inhabitants of the various provinces comprising the empire became thereafter Roman citizens; and as that empire embraced the civilized world, there could be few or no instances thereafter of personal naturalization.—The mode of obtaining naturalization in modern times, and the conditions upon which it will be granted, differ in different countries. In the United States the power of conferring it is exclusively vested in the national government. This power has been sometimes exercised by a collective naturalization, in cases where foreign territory has been acquired, and in respect to certain Indian tribes, as well as by the fourteenth amendment of the constitution, which made citizens of the freedmen and other colored persons; but the mode in which individuals obtain it on their own application is regulated by acts of congress. The policy of this country on the subject, which is characterized by a desire to admit all foreigners of good character to a full participation in all the rights enjoyed by our own citizens, after a period of probation sufficiently long to enable them to become acquainted with the nature of our institutions, is to be traced back to an early period of our colonial history. It was not derived, like many of our laws, from the enactments or the example of Great Britain, but grew out of the necessities attendant upon the settlement of a new country. At the period when the colonies were founded, the policy of England for more than a century had been hostile to conferring political privileges upon foreigners; and so illiberal was its course in this respect through the whole period of our colonial history, that one of the acts of tyranny charged upon George III. in the Declaration of Independence was, that he had endeavored to prevent the population of the states by obstructing the laws for the naturalization of foreigners, and by refusing to pass others to encourage their migration hither. The only mode by which a foreigner in England could obtain naturalization, investing him with all the rights of a subject, was by act of parliament. He could obtain letters of denization by the king's special license, which was granted with certain restrictions. In the seventh year of the reign of Queen Anne an act was passed naturalizing foreign Protestants, by which persons of this class could be admitted to all the rights of subjects upon receiving the sacrament and taking the oaths of abjuration and allegiance; but it was repealed in the short space of three years. The rights of foreigners settled in the colonies were in a very precarious state. By the law of England they could neither hold nor transmit real property, nor exercise any political rights; and by the navigation act, unless they were naturalized or made

free denizens by the king's letters patent, they were forbidden to exercise in any of the colonies the occupation of a merchant or a factor. To remedy this state of things and to encourage immigration, the colonial legislatures exercised the right of passing naturalization laws. Maryland was the first colony that took this course. In 1666 she enacted a law for the naturalization of the Dutch from Cape Henlopen and the French Protestant refugees who had settled in the colony, and continued to pass laws for the naturalization of aliens to the time of the revolution. In 1671, in the reign of Charles II., the colony of Virginia passed an act for the naturalization of any one desiring to make that commonwealth his constant residence, who might apply by petition to the general assembly. Five acts were afterward passed, naturalizing a number of aliens who had petitioned for the privilege; and in 1680 the governor was authorized to grant letters of naturalization to any foreigner settled in the colony upon his taking the oath of allegiance. In 1705 a law was passed adding the test oath to the oath of allegiance to secure the Protestant succession, and in 1738 another act naturalizing any alien who might settle upon the Roanoke. In South Carolina, in 1693, the French Protestants who had settled in the province were made citizens by the colonial legislature; and in 1731 Massachusetts passed an act for the admission of foreign Protestants after a residence of one year. The colony of New York passed an act in 1683, declaring that all actual inhabitants of the province professing Christianity, of whatever foreign nation, should be entitled to all the privileges of natural-born subjects upon taking the oath of allegiance. Delaware in 1700 passed an act empowering the governor to declare any alien, previously settled, or thereafter coming to settle in the province, naturalized, upon taking an oath to be true and faithful to the king and to the government of the province, and declaring that all Swedes, Dutch, and other foreigners settled in the colony before its acquisition by the English were to be deemed fully and completely naturalized. Pennsylvania also passed a naturalization law in the same year, and South Carolina a general act in 1696. These laws were not favorably regarded in England. They were looked upon as encroachments upon the royal prerogative or the rights of parliament; and even in the colonies, the more strenuous loyalists denounced them as disregarding the navigation acts, and as tending to an undue increase of the inhabitants, thereby creating formidable antagonists to English industry, and nursing a disposition to rebellion. In 1715 the colony of New York passed an act for the naturalization of all foreign Protestants then inhabiting the province. The act was referred by the board of trade to Northey, the English attorney general, who condemned this mode of naturalizing "in the lump," but recognized the right of the colonial legislature to naturalize particular aliens by

name, after inquiring into each case specially; and thereafter down to 1773 some 14 acts were passed, by which an immense number of aliens were naturalized by name. In 1740 an act was passed by the British parliament for the naturalization of foreign Protestants settled in the colonies of America. It required a residence there of seven years, without having been absent at any time for more than two months; all naturalized under it, except Quakers or Jews, had first to receive the sacrament of the Lord's supper in some Protestant communion; and by an act passed in 1747, the benefit of the previous act was extended to the Moravian Brethren, and other foreign Protestants settled in America, who had conscientious scruples against taking an oath. This was undoubtedly designed to supersede colonial legislation, but it did not have that effect. The long period of residence required was very objectionable in a new country, and the Catholics, who had settled extensively in Maryland, were excluded from its provisions. The colonial legislatures still continued to pass naturalization laws, and the difficulties growing out of the subject continued to increase until the separation of the two countries.—During the revolution, and until the adoption of the federal constitution, the power of naturalizing aliens was exercised by the states. The constitution of the state of New York, adopted in 1777, declared that it should be in the discretion of the legislature to naturalize all such persons, and in such manner, as they should think proper. The legislature enacted no general law, but continued to pass acts for the naturalization of persons by name down to the year 1790. After the breaking out of the revolution, and especially after the independence of the United States was recognized by Great Britain, it became necessary both here and in England to determine who of those born in the colonies were to be deemed aliens. It was decided in the English courts that all persons of this class, adhering to the American government during the war and until after the treaty of 1783, ceased thereafter to be subjects of Great Britain, and were aliens; but in the American tribunals it was held that the colonies acquired all the rights and powers of sovereign states when they declared their independence on July 4, 1776, and that the people of the respective states ceased upon that day to be subjects of Great Britain, and became members of the new nation then formed; that none were excepted unless, within a reasonable time after that event, they had placed themselves under the protection and power of the government of Great Britain in such a way as to indicate an election on their part to remain in allegiance to that country. It was conceded by the tribunals of both countries that all persons born in the colonies had a right, upon the happening of such an event as the revolution, to elect to which government they would adhere; the point upon which they differed being that

the English courts considered the date of the treaty of 1783 as the period when we ceased to be subjects, while our courts adopted as the era the day of the declaration of independence. In some of the states laws were passed soon after the declaration of independence, setting forth that all abiding in the state after that event, or after a certain specified period, and deriving protection from the laws of the state, owed allegiance to it. This was the case in New York, Massachusetts, Pennsylvania, and New Jersey. In other states no special laws were passed, but each case was left to be decided upon its own circumstances according to the voluntary acts and the conduct of the party. It was also held that persons born in Great Britain who adhered to the American cause until the close of the war, became thereby American citizens; and that the natives of the colonies absent and living under the protection of Great Britain at the declaration of independence, but who returned to the country before the treaty of 1783, and continued here afterward, were citizens. This question of the alienage or citizenship of those born in the country before or during the war became a very important one, as it involved the right of succession to landed property, and was a fruitful source of litigation, until ultimately settled by the tribunals of both countries. In the articles of confederation there was a clause declaring that the free inhabitants of each state should be entitled to all the privileges and immunities of free citizens in the several states; and as each state had the power of determining for itself upon what condition aliens should be admitted, and as in some of the states higher qualifications were required by law than in others, it was felt that great inconveniences would arise in the practical operation of this provision. A single state had the power of forcing into another any alien upon whom it might confer the right of citizenship, though declared to be disqualified by the laws of that state. One state had but to naturalize him, and then, by the effect of the clause in the articles of confederation, he became a citizen in every other, thereby making the law of one state paramount to that of the rest. No actual difficulty occurred, but the most serious embarrassments were likely to arise at any moment. Therefore, when the federal constitution was framed in 1787, a provision was inserted without debate conferring upon congress the power of establishing one uniform rule of naturalization throughout the United States; and at the second session of the first congress after the adoption of the constitution, on March 26, 1790, an act of the most liberal character was passed, authorizing the naturalization of any free white alien after a residence of two years under the jurisdiction of the United States, and of one year in the state where he applied for admission; and from that time to the year 1872 some 18 acts were passed upon the subject. In 1795 the period of residence

was increased to five years, and a previous declaration upon oath by the alien of his intention to become a citizen was required to be made before a court of one of the states, at least three years before the applicant's admission. In 1798 the residence was increased to 14 years, with five years' previous declaration of intention. In 1802 the residence was reduced again to five years and the declaration of intention to three years; and in 1824 the declaration of intention was further reduced to two years. It was supposed in some of the states that they still had concurrent jurisdiction, and Virginia adopted a conflicting statute in 1790; but it was held by the supreme court of the United States in 1817 that the power to naturalize was vested exclusively in congress. The soundness of this decision was much questioned at the time, but it is now universally acknowledged to have been correct. But though no state can confer upon any alien all the rights and privileges of a citizen of the United States, it may grant him any civil or political privileges within its own jurisdiction not inconsistent with the laws of the United States; and in many, especially in the western states, aliens are allowed to hold land, to exercise the elective franchise, and to enjoy many of the privileges of citizens; a liberal policy which has contributed greatly to the rapid settlement of these states, and to their increase in wealth and prosperity.—Until the enactment of the revised statutes in 1874, the laws of the United States on the subject of naturalization had to be gathered from many statutes, some of them relating to other subjects; and the want of one general act, in which the whole law should be embodied and clearly expressed, was much felt. The qualifications requisite, and the mode of obtaining naturalization, are at present (1875) as follows. The applicant must have resided in the United States for the continued term of five years next preceding his admission, and one year at least within the state or territory where the court is held that admits him. Two years at least before his admission he must declare on oath or affirmation, before a court of record having common-law jurisdiction and a seal and clerk, or before a circuit or district court of the United States, or before a clerk of either of the said courts, that it is *bona fide* his intention to become a citizen, and to renounce for ever all allegiance and fidelity to any foreign prince, potentate, state, or sovereignty, and particularly by name the prince, potentate, state, or sovereignty of which he is at the time a citizen or subject. This declaration is recorded by the clerk, and a certificate under the seal of the court and signed by the clerk that he has made such a declaration is given him, which is received thereafter as evidence of the fact. If the applicant was a minor under the age of 18 years when he came to the country, this previous declaration of intention is dispensed with, and he is entitled to be admitted after he has ar-

rived at the age of 21 years, if he has resided five years in the United States, including the three years of his minority, and has so continued to reside up to the time when he makes his application, upon complying with the law in other respects. There is some obscurity in this latter provision. Some have thought that the three years of minority, from 18 to 21, is all that can be allowed as a part of the five years' residence demanded by the act, and that one naturalized as a minor was not entitled to be admitted until he had arrived at the age of 23; but it has been decided in the New York common pleas (all the judges concurring) that he is entitled to be admitted at 21, if he had resided here since he was 15; that all that the statute requires is, that he must in every case have resided here between the ages of 18 and 21, and if he has done that, and also resided here two years before that period began, it is a residence of five years within the meaning of the act. By an act passed in 1862 an alien who has enlisted in the armies of the United States, either in the regular or volunteer service, and who has been honorably discharged, may, upon proof of one year's residence in the United States and of good character, be naturalized without any previous declaration of intention. By the act of June 7, 1872, any seaman who declares his intention in a competent court to become a citizen, and who thereafter serves for three years on board of a merchant ship or ships of the United States, can, upon the production of a certificate of his discharge and good conduct during that time and of his previous declaration, be naturalized; and for the purpose of protection he is deemed a citizen after the filing of his declaration of intention to become one. When the applicant has completed the necessary residence, he must prove the fact before one of the courts previously named by other testimony than his own oath. One witness, if he knows the fact, is sufficient. If entitled to admission without a previous declaration of intention, the alien must declare upon oath, and prove to the satisfaction of the court, that for the three years next preceding his application it was *bona fide* his intention to become a citizen; and every applicant must prove (which may be done by his own oath, unless the court should require other testimony) that he has behaved during the period of his residence as a man of good moral character, attached to the principles of the constitution of the United States, and well disposed to the good order and happiness of the same. The mode of admission is as follows. The applicant goes to the clerk of the court, and exhibits the certificate of his having declared his intention. The clerk then prepares a written deposition for the witness, setting forth his knowledge of the applicant's residence and of his good character, and another for the applicant, declaring that he renounces all allegiance to every foreign power, and particularly that of which he is a citizen or subject, and, if he

has borne any title of nobility, that he renounces it, and that he will support the constitution of the United States. The parties are then taken before the judge, who examines each of them under oath; and if he is satisfied that the applicant has resided in the country for the requisite period, and is a man of good character, he makes an order in writing for his admission. The depositions are then subscribed by the parties and publicly sworn to in court in the presence of the judge; and the certificate of the declaration of intention, the depositions, and the order of the judge are filed, and constitute the record of the proceeding. A final certificate under the seal of the court, signed by the clerk, is then given the alien, declaring that he has complied with all the requisites of the law, and has been duly admitted a citizen; which certificate is conclusive evidence thereafter of the fact. In the case of a minor the previous declaration of intention is dispensed with, but in all other respects the course of procedure is the same. The record of naturalization, if regular upon its face, is conclusive as to the naturalization of the alien, and cannot be contradicted by extrinsic evidence. It may be set aside, however, if fraudulently obtained, by the court in which the alien was naturalized; and a very elaborate and effective act was passed July 14, 1872, making it a felony to obtain or knowingly to assist in obtaining a fraudulent naturalization. Acts have been passed for the admission of persons residing in the United States before certain dates without previous declaration of intention; but they have all become obsolete by lapse of time, except possibly the last, relating to those so residing prior to June 18, 1812. A child born out of the United States is a citizen if the father was one at the time of the birth of the child, but the right will not descend to one whose father has never resided in the United States; and the minor children of persons naturalized, if the children are then dwelling in the United States, become citizens by the naturalization of the parent. It was formerly questioned whether this latter provision applied to any but the children of parents naturalized before the passage of the act in 1802. Chancellor Kent, in his "Commentaries," inclined to the opinion that the act was prospective, and was designed to embrace the children of persons who should thereafter be naturalized; and opinions to the same effect were expressed by many eminent jurists. But the point came up for decision in the court of chancery of the state of New York in 1840, in the case of children who were minors, living with their father in this country, when the father was naturalized in 1830, and whose right to succeed to his estate was denied upon the assumption that they were aliens. Chancellor Walworth decided that they were not aliens, but became citizens in 1830 by the naturalization of their father. After an elaborate examination of the legislation of congress, he held that the provision in

the act of 1802 was prospective, so as to embrace the children of aliens naturalized after the passage of the act, as well as the children of those who were naturalized before. Decisions to the same effect were rendered by Chief Justice Daly in the New York court of common pleas in 1847; by the supreme court of Arkansas in a case of great public interest in which the question was elaborately examined, in 1850; and by the supreme court of Florida in 1865. Another important question under this provision is whether both parents should be naturalized to confer the right upon children. The importance of this question is greatly lessened in cases of naturalization after Feb. 10, 1855, as congress on that day passed an act declaring "that any woman who might be lawfully naturalized under the existing laws, married or who shall be married to a citizen of the United States, shall be deemed and taken to be a citizen;" but before that time the American courts had repeatedly held that a wife who was an alien did not become a citizen by the naturalization of her husband. These two questions are of great practical importance, as vast numbers of persons since the enactment of this provision have inherited, purchased, and transmitted real property upon the assumption that they were citizens by the naturalization of their fathers, whose rights, and the rights which others have derived from them, would be disturbed if a different construction were now given to this provision; and although these two questions have not been decided by the highest authority in this country, the supreme court of the United States, it may nevertheless be assumed that they are now settled, and the construction above stated universally acquiesced in. A doubt arose whether the act of 1855 applied to a woman who was married to her husband before he was naturalized, the language of the act being, "married or who shall be married to a citizen." The supreme court of the United States decided that these words refer to a state of marriage, and not to the time when the ceremony was performed; that whether married before or after the naturalization of her husband, the wife becomes by his naturalization also a citizen, it being the manifest intent of the act that the citizenship of the wife should follow as a consequence of the naturalization of the husband; and it was decided in North Carolina in 1869 that a white woman, a native of Ireland, who married an American citizen, was a citizen of the United States, although she had always resided in Ireland. If an alien who has declared his intention dies before he is naturalized, his widow and children may become citizens by simply taking the oath required of all naturalized citizens to support the constitution of the United States, and to renounce all previous allegiance. In this case the period of residence of the widow and children is immaterial, nor is any distinction made between minor children and adults.—In certain cases aliens are disqualified

from becoming citizens. No alien can be admitted while his country is at war with the United States, nor could one be admitted who was legally convicted of having joined the British army during the American revolution, or who was proscribed by any state before 1802, unless with the consent of the state. The statutes formerly provided only for the naturalization of "free white" persons, which is supposed to exclude all that can be denominated colored races—the copper-colored natives or Indians of America, the African races, and the yellow races of Asia. It has been held by the courts of California that a Chinese is not a white person within the meaning of the act, and cannot therefore be naturalized. In the celebrated Dred Scott case the supreme court of the United States in 1856 held that the Africans imported into the country and their descendants were a subjugated race, and not the people by whom the government was established; that they were not and never were intended to be embraced under the denomination of citizens; and that when the right to naturalize was surrendered by the states to the federal government, it was meant to be confined to persons of foreign birth, and not a power to raise inferior races here to the rank of citizens, such as Indians, negroes, and mulattoes, though upon this latter point the judges differed. Indians, and persons of mixed Indian and African blood, have however been admitted to the rights of citizenship by special treaties and acts of annexation. This was done by article 14 of the treaty with the Choctaws of Sept. 27, 1830; by article 12 of that with the Cherokees of May 23, 1836; and in the treaties by which Louisiana, Florida, and California were acquired. A delicate question arose as to the degree of mixture or color which would preclude one from being denominated a white person. There was no agreement on the subject even in the slave states. In some the proportion was one eighth, in others one fourth; and in South Carolina any distinct and visible admixture of negro blood, to be determined by the evidence of features, complexion, and parentage, was sufficient. On the other hand, in the free state of Ohio any one being nearer white than black, that is, having more than one half white blood, was declared to be white. The question has ceased to be of its former importance since the adoption in 1868 of the fourteenth amendment of the constitution of the United States, which declares that all persons born or naturalized in the United States and subject to the jurisdiction thereof are citizens of the United States and of the state wherein they reside, and that no state shall make or enforce any law which shall abridge the privileges or immunities of citizens of the United States. It was held by the supreme court of the United States in 1872, in the slaughter house cases, that this enactment was primarily intended to confer citizenship on the negro race; secondly, to give definitions of citizenship of the United

States and of the states; and that it recognizes the distinction between the two. Since the act of July 14, 1870, aliens of African nativity and persons of African descent may be naturalized. The question however remains, under the laws, what admixture of color will preclude one from being denominated a white person, and may arise when persons of mixed Indian blood born out of the United States apply to be naturalized.—The residence required by the naturalization laws is a permanent abode in the country; and when that is established or begun, it will not be affected by a temporary absence upon business or pleasure, if the intention to keep up the residence here and return has always existed, and no residence has been established elsewhere. A man's residence may be defined to be the place where he abides, with his family if he has one, and makes the chief seat of his affairs and interests. In respect to seamen who have no fixed place of residence, they are provided for in the act of 1872 before referred to.—Many questions have been decided by the courts in respect to naturalization, which will be summarily stated. Foreigners by birth are *prima facie* aliens, and must show that they have been naturalized before they can inherit; and if not entitled to inherit, being aliens, they cannot become so by afterward getting naturalized. The marriage of an American woman with an alien does not make her an alien; but if she emigrates to a foreign country with her husband and takes up her abode with an intention to remain there permanently, she would probably be regarded as having lost the character of an American citizen, at least while such a state of things existed, especially if in the country in which she dwells she is by its laws a citizen or subject there, by being married to a citizen or subject of that country. Emigration to another country, swearing allegiance to it, and entering and uniformly continuing in the service of its government, are sufficient to show expatriation, and that the person has lost the character of an American citizen. A child born in a foreign country, whose mother was a native of that country, and whose father was an American citizen who went there with the intention of remaining, but was never naturalized there, is an American citizen, and can inherit property in the United States. A child born of non-resident parents, if born in one of the United States, is *prima facie* a citizen, although his mother was in the state merely for the purpose of being confined. A child born abroad of an American citizen is subject to a double allegiance; but upon arriving at maturity he may elect one and repudiate the other, and such election is conclusive upon him. Allegiance in the United States is twofold, to the Union and to the particular state; but that to the Union is paramount. Where a territory is conquered, it operates to change the allegiance of the people; but their relation and rights in respect to each other remain undis-

turbed. Citizens of Texas before the annexation became citizens of the United States by that act, which operated as an act of naturalization; and it was decided in Pennsylvania that a native of Saxony who went to Louisiana in 1801, and was residing there when the territory was ceded to the United States in 1803, and continued to reside there afterward, became by the act of cession a citizen of the United States. A court having neither clerk nor recording officer distinct from the judge is not a court entitled to naturalize.—As to the right of a citizen or subject to expatriate himself and renounce his allegiance to his native country, there was formerly even in the United States great difference of opinion. The most authoritative writers upon the law of nations treated it as an inherent right, and it was so regarded in many of the European nations. In England, however, it was held by the courts that the allegiance of a native-born subject was intrinsic and perpetual, of which he could never divest himself by any act of his own, and that it was not in the power of any foreign prince or nation, by naturalization, to dissolve the bond between a British subject and the crown. In the supreme court of the United States the question was elaborately discussed in three cases, but was not passed upon, while in the state courts there were conflicting decisions. Chancellor Kent in his "Commentaries," after reviewing all the decisions, declared the better opinion to be that an American citizen could not renounce his allegiance without the consent of the government in a mode prescribed by law; and as congress had passed no law, that the rule of the English common law remained unaltered. On the other hand, the executive branch of the government recognized the right. Gen. Cass, the secretary of state, did so in 1859; and Attorney Generals Cushing and Black both officially advised the government that an American citizen could renounce his allegiance. Finally an act of congress was passed July 27, 1868, declaring expatriation to be an inherent right in all men, and that any act of any officer of the government which denied, restricted, impaired, or questioned it was inconsistent with the fundamental principles of the government. In the same year it was settled by treaty between the United States and the North German Union that if a citizen or subject was, after a residence of five years, naturalized in either country, he was to be deemed a citizen of that country; that if he returned to the land of his birth, he could not be prosecuted for any criminal offence unless it was committed before his expatriation; and that by a residence of two years in the country to which he originally belonged, with no intention of returning to the one of his adoption, he would be presumed to have renounced his naturalization. In 1870 Great Britain, by an act of parliament, which will be hereafter referred to, abandoned its former policy; and the right of

expatriation and the renunciation of allegiance is now recognized in the United States, Great Britain, France, Russia, Germany, Austria, Italy, Spain, Belgium, Holland, Denmark, Sweden, and Norway; but in some of these countries it is subject to the condition that the native has fulfilled the obligations imposed by his former allegiance, such as military service. —In Great Britain, prior to 1844, naturalization could be effected only by act of parliament. Originally it conferred all the rights of a natural-born subject, but by an act dictated by the jealous policy of the government upon the accession of the house of Orange, passed in 1701, it was declared that no one, though naturalized, should be of the privy council or a member of parliament, or hold any office civil or military, or be allowed to receive any grant of land from the crown. As before stated, the king might grant letters of denization conferring certain limited rights, in the exercise of his royal prerogative. In this state the law remained until the reign of Victoria. Great desire having been expressed for more liberal enactments, the subject was referred to a committee of parliament, who made an elaborate investigation, and a law was passed in 1844 defining the privileges of aliens upon some questionable points, and providing for the naturalization of all aliens residing in or coming to Great Britain with intent to settle. The provisions of this act need not be enumerated, as they were superseded by a more comprehensive act passed in 1870, which repealed a number of the preceding laws. By the latter act any alien who has resided for five years in the United Kingdom, or has been for that period in the service of the crown, and intends after naturalization to continue in that service or to reside in the United Kingdom, may, upon producing such evidence of his residence, service, and intention as shall be satisfactory to one of her majesty's principal secretaries of state, receive from such secretary a certificate of naturalization, which shall take effect after the alien has taken the oath of allegiance; upon which he shall be entitled to all the rights and be subject to all the obligations of a natural-born subject, but shall not within the limits of the foreign state of which he was a subject be deemed a British subject, unless he has ceased to be a subject of that state by its laws or by treaty. The secretary of state may grant or refuse the certificate without giving any reasons, and from his decision there is no appeal; and he may grant a special certificate of naturalization to any person, in respect to whose nationality as a British subject there is any doubt, which is not to be an admission that he was not previously a British subject. This act contains many important provisions in respect to alienage and expatriation. It provides that aliens may acquire, hold, and dispose of real and personal property in the same manner in all respects as naturalized British subjects, and that

it may be derived from or through them in all respects as from or through natural-born subjects. This however does not extend to property out of the United Kingdom, nor confer upon them any municipal, parliamentary, or other franchises, or entitle them to hold office. It declares that any British subject in a foreign state, who was not under any disability, and who has voluntarily become naturalized in that state, shall cease to be a British subject; that any person who by his having been born in the dominion of the queen is a British subject, but who at the time of his birth was also by its laws, and is still, a subject of a foreign state, may cease to be a British subject by making a declaration of his alienage in the presence of any diplomatic or consular officer in the service of the queen, or if such person is in the United Kingdom before a justice of the peace, or if he is elsewhere in her majesty's dominions before any officer authorized to administer an oath; and that where a convention to that effect has been entered into by the queen with a foreign state, any subject or citizen of that state who has been naturalized as a British subject may in like manner make a declaration of alienage, upon which he shall cease to be a British subject, and shall be thereafter regarded as a citizen or subject of the country to which he originally belonged. Under this act also a married woman is to be deemed a subject of the country of which her husband is a subject. If she is a widow and was born a British subject, she may obtain a certificate of admission to British nationality. The children of British subjects naturalized in a foreign country, who during infancy became resident of the country where their father or mother was naturalized, and who according to the laws of the country became naturalized therein, are to be deemed citizens or subjects of that country and not British subjects: and when the father, or the mother if a widow, has been readmitted to British nationality, the children, if they have become residents during infancy in the British dominion with the father or the mother, resume their position of British subjects; and if the father, or the mother if a widow, become naturalized, the children are deemed British subjects if they during infancy become residents with their father or their mother in any part of the United Kingdom. And finally all laws made in the British colonial possessions respecting naturalization are to have the authority of law, but are subject to be confirmed or disallowed by the queen like other colonial laws.—In the various British colonies naturalization is either granted by the governor, or by a special act or ordinance of the colonial legislature or council, in each instance, or it is regulated by a general local law. It is granted by the governor in Jamaica, the Bahamas, Antigua, Turk's and Caicos islands, Newfoundland, Victoria, South Australia, Tasmania, and New Zealand; by a special act or ordinance in each case in West-

ern Australia, British Guiana, Barbadoes, St. Vincent, St. Lucia, Grenada, Trinidad, and generally in the minor West India islands. In Antigua, Grenada, and St. Vincent immigrants from the United States and British North America, of African descent, who have served under a contract for a year, can after three years' residence become naturalized by taking the oath of allegiance before the governor and secretary of the colony. In Sierra Leone it is regulated by an act of the imperial parliament. In New South Wales, Bermuda, and Honduras, it is, making the necessary changes, the same as under the English act of 1844. In the following colonies it is regulated by a general local law: Canada, St. Christopher and Anguilla, Turk's and Caicos islands, and Cape Colony. In Canada and Cape Colony a certain period of residence is required. In all the colonies an oath of allegiance is taken and a few other formalities are requisite. In Canada an oath by the applicant of three years' residence with intent to settle, and an oath of allegiance, are taken before a justice of the peace. The justice transmits a certificate that the requisite oaths have been taken to the court of the city or place where the applicant resided on the first day of its sitting; this is publicly read in court, and if no valid objection is made the certificate is filed and the act of naturalization is complete. The effect of naturalization by the local government of a colony or country forming part of the dominions of the crown of England, was considered in a case arising in the reign of Charles II., *Craw against Ramsey*, reported in *Vaughan's Reports*. It was declared in that case that a person naturalized by the parliament of Ireland, or naturalized in Scotland, which at that period was an independent kingdom, connected with England only by the circumstance that the crowns of both kingdoms centred in one person, did not thereby become a naturalized subject in England; that the effect of such a naturalization did not extend beyond the limits of the country where it was conferred, and that this applied to all the colonies or dependencies of the crown of England. It was also held in two cases before the privy council, in 1834 and 1837, one of which arose in the island of Mauritius and the other in Canada, that the status or political condition of a person resident in one of the British dependencies was to be determined by the law of Great Britain, but that the rights or liabilities which attached to it, when ascertained, depended upon the law of the particular colony.—The policy of France upon this subject has been restrictive, which may be traced in a great degree to the unfavorable influence exercised by foreigners at various periods of her history. Many Italian adventurers were naturalized in the reign of Charles VIII., but their characters were so worthless that their certificates of naturalization were annulled by his successor Louis XII. in 1499. At the time of the league great numbers of naturalized Spaniards and

Italians mingled in public affairs, and gave such offence, especially as a branch of the clergy, that a law was passed in 1579 prohibiting foreigners from holding ecclesiastical offices. Their participation in the civil administration of the state reached its climax when the notorious Italian Concini, the *protégé* of Maria de' Medici, became a marshal without ever having drawn a sword, and minister, ruling with capricious insolence a people of whose laws he was ignorant. After his tragical end in 1617, an act was passed debarring foreigners from holding a seat in the administration; and the mischief wrought by Mazarin and his foreign camarilla led to a still more stringent law in 1651. No material change took place until the revolution, when in 1791 the legislative assembly was authorized to naturalize foreigners upon the condition that they fixed their residence in the country and took an oath of allegiance. In 1793 a law was enacted admitting all to the rights of French citizens who had been domiciled in the country one year, over the age of 21, who supported themselves by their labor, or acquired property, or who should marry a native, or adopt a French infant, or support an aged person, and all others whom the convention regarded as meriting well of humanity. In 1798 a residence of seven consecutive years was made necessary; and as the country gravitated toward monarchy in 1800, the residence was extended to ten consecutive years. In 1803 the residence was reduced to one year, if the alien had rendered important service to the state by his talents, inventions, useful industry, or by forming large establishments therein. In 1808 it was provided that naturalization upon the ground of important services to the state, thereafter known as *la grande naturalisation*, should be conferred by a decree ratified by the council of state. In 1814 it was declared that no naturalized subject should be eligible to a seat in the legislative chambers, unless he had received the grand naturalization. After the revolution of 1848 the term of residence was reduced to five years, and in 1867 it was further reduced to three years. As the law now stands, the grand naturalization after the residence of a year, in the cases already mentioned, is conferred by a decree of the executive, and ratified by the legislature. In other cases the alien must have attained the age of 21, must have resided in France for three consecutive years under the authorization of the government, and have declared his intention of fixing his residence there; and the application must be made in the manner provided for by the decree of 1809. A child born in France of foreign parents, or the child of French parents born abroad, may reclaim the rights of citizenship on attaining the age of 21, if he resides in France and declares his intention of there fixing his domicile, or if, residing abroad, he makes a similar declaration and establishes himself in France within

the year that he makes his declaration. A foreign woman marrying a native becomes a French subject, and a French woman marrying a foreigner follows the condition of her husband; but becoming a widow, she recovers her nationality if living in France, or if she returns to it with the authority of the executive, and declares her intention of fixing there her residence. A foreigner living in France enjoys the same civil rights that are accorded to Frenchmen in the country to which the foreigner belongs. Citizenship is lost by naturalization elsewhere, by accepting office or a pension under another government without the authority of the executive, or by so establishing one's self abroad as to indicate an intention not to return; but dwelling abroad for commercial purposes does not have that effect. Citizenship may be recovered by renouncing the foreign office and domicile, on due application to the state, upon declaring an intention to fix a residence in France and renouncing all distinctions contrary to its laws. A difference is recognized since 1823 between letters of naturalization and letters of nationality, the former conferring a new right, the latter merely restoring a right that was lost or in abeyance. All Frenchmen, whether naturalized or holding office abroad with the consent of the executive, who are taken bearing arms against France, suffer the penalty of death; it constitutes no exemption that they were serving in obedience to the laws of their adopted country. Not only in this provision, but upon naturalization of foreigners generally, the policy of the government is in practice very illiberal. In 1852 a difficulty arose between the governments of the United States and France, upon the claim of the latter to compel a Frenchman naturalized in the United States to serve in the French army. At the earnest remonstrances of the American minister, the case was investigated by the French minister of war, and he was of opinion that the claim of the government of France could not be supported, but he left the matter to be determined by the judicial tribunals. The question afterward came before the French courts in the case of two natives of France naturalized in the United States, who upon their return to their native country had been compelled to enter the French army; and after a full examination of the whole subject, it was decided that as France recognized the right of expatriation, it followed as a consequence that it could have no claim upon a native of France who by naturalization became the citizen of another country; that by being naturalized a Frenchman changed his allegiance and lost his native character, and could not on returning to France be compelled to serve in the army, or perform the obligations required of a French subject or citizen. The decision was approved by the imperial government, and the men were discharged.—In Belgium naturalization is granted by a legislative act. It is of two kinds, grand and ordinary. The first

is conferred only where eminent services have been rendered to the state, and the person to whom it is granted is placed in every respect upon an equality with a native. The second naturalization, *ordinaire* or *petite*, admits to every privilege except the exercise of those political rights which are reserved for the grand naturalization. In contradistinction to France, the policy of the Belgian government on this subject is distinguished by great liberality. In the Netherlands, by the fundamental law of 1848, a foreigner can be naturalized only by an act of the states general, approved by the king; but he acquires substantially the privileges of a subject if he has permission from the king to establish a domicile, and gives notice to the administration of a commune that he has established his domicile in that commune, with a declaration of his intention to settle in the kingdom, and retains his domicile in the same commune for six years. In neither country is any stated period of residence demanded, or any other special condition required; and citizenship in both may be lost for the same causes as in France, and restored in the same way.—In Sweden, by a law passed in 1858, an application must be made by petition to the king, accompanied by proof of the age of the petitioner, his religion, his native country, the time of his immigration, the places where he has resided in Sweden, and his general good conduct. He must be 21 years of age, of good character, a resident of Sweden for three years, must have the means of supporting himself, and must not be of the Roman Catholic religion. If he has been previously admitted into the service of the state, or is known as a man of more than ordinary ability in the arts or sciences, or in the industrial pursuits of agriculture or mining, or if for other reasons it is considered that his adoption as a Swedish subject would prove useful to the state, the three years' previous residence may be dispensed with. In Norway naturalization is granted by the *storting*, the national legislative assembly, in which this power is exclusively vested, the assent of the king in this case not being necessary; but any one who has definitively fixed his domicile in Norway, and resided there for ten years, has all the civil and political rights of a Norwegian subject. In Denmark a petition must be addressed to the president of the *rigsraad*, with a certificate of two citizens that the petitioner has resided one year in the country. An act is then passed by the *rigsraad*, declaring that the petitioner may reside and trade in the kingdom, with all the rights and subject to all the duties of a native-born subject. It must be approved by one of the ministers and receive the sanction of the king, and the privilege is almost invariably granted as a matter of course whenever applied for.—In Russia, by the law of 1864, a domicile of five years is requisite, which may be shortened in special cases. To acquire a domicile the foreigner must declare his wish to the gover-

nor of the province where he intends to reside, and explain the nature of his occupation in his own country and the pursuit he purposes to follow in Russia; upon the receipt of which declaration he becomes domiciled. When the requisite time has elapsed application for naturalization must be made to the minister of the interior, with whom it is optional to refuse or grant the petition. If granted, the alien becomes naturalized by taking an oath of fidelity to the emperor, and is then in respect to his rights and obligations upon a perfect equality with native-born Russians. He may if he wishes afterward renounce his naturalization on payment of all claims against him, governmental or private, and return to his native country or remain in Russia as a foreigner. Foreigners in the military or civil service of Russia, and ecclesiastics of foreign persuasions, are naturalized by taking the oath of allegiance without any fixed period of domicile. The oath of allegiance is merely personal, and does not affect children previously born, who however may be admitted upon the same terms as their parents. Children who are born afterward are Russians. Children of foreigners born and educated in Russia, or born abroad and educated in a Russian upper or middle school, may be naturalized a year after they have attained their majority.—As most of the German states are now incorporated in the German empire, their previous regulations respecting naturalization and citizenship have been modified by a comprehensive provision preserved from the constitution of the North German confederation adopted in 1867, which declared that citizenship should thereafter be subject to the regulations of the confederation and of its legislature; that a common right of citizenship prevailed in the confederation, and that the citizens of each constituent member of it should be treated as natives in all the others. A bureau has recently been established by the national government to which, it is said, this whole subject has been committed. As a general rule, under the regulations formerly in force, naturalization was granted if the applicant had been released from his former allegiance, or had been allowed by his government to emigrate; if he were of good character, and had discharged all his obligations in the particular state to which he belonged, such as paying his debts and fulfilling his military duty, which latter condition was required only of those from other German states. Application was made in writing to the council of the city or village where the applicant resided, showing that he came within the above requirements. The petition was closely scrutinized, and if favorably regarded was sent with a report to the highest authority in the state, and a diploma signed by the proper minister was transmitted and given to the petitioner upon the payment of a small fee. If the petition was refused by the local authorities, it was simply sent back, but the reasons

were given if applied for. An appeal might be taken, but was of little value, as the decision of the local authorities was almost invariably affirmed. In Prussia, by a law of 1842, the superior administrative authorities are empowered to naturalize any stranger who satisfies them of his good conduct, certain exceptions being made. Citizenship is acquired by nomination to a public office, or by the marriage of a foreign woman with a Prussian. The quality of a Prussian subject is lost by his being discharged upon his request, which is not granted to males between the ages of 17 and 25 years without a military certificate that the application is not made to avoid the performance of their military duty. It is also lost by the sentence of a court, by living ten years in a foreign country, by entering a foreign service without the permission of Prussia, or by the marriage of a female subject with a foreigner. If there is no special exemption, the certificate of discharge comprehends the wife and the minor children that are still under their father's authority.—In Austria, a foreigner acquires the rights of citizenship if employed as a public functionary, but not by mere admission into the military service, nor by receiving a title of distinction or honor, but is treated as a citizen if maintained by the government on account of military services. The right may be conferred by the superior authorities upon an individual after ten years' residence without interruption, upon proof of the fact and upon taking the oath of allegiance. The authorities, however, may grant it before the expiration of that period upon proof of good moral character and of the applicant's ability to support himself; and foreigners acquire the rights of citizens by entering into business requiring a permanent residence. The temporary possession of a farm, however, of a house or other real estate, or the mere establishment of a manufactory, or a commercial business, or a partnership, does not confer the right. An emigrant who has left the empire by permission of the authorities, with the intention not to return, forfeits his privileges as a subject. Marriage with an Austrian confers citizenship upon the wife.—In Switzerland, under the constitution of May 29, 1874, a foreigner obtains citizenship, and thereby equal rights with the citizens in all cantons, by paying a fee in any commune, varying from about \$4 to \$300, according to the amount of communal property.—In Portugal, an application must be made to the king through the secretary of foreign affairs, which is referred to the council of state. The applicant must be over 25 years of age, have resided in the country one year, and have the means of subsistence. The year's residence may be dispensed with if he is of Portuguese blood, or upon proof that he has married a Portuguese, or been useful to the state by embarking in commerce, improving any branch of the arts, or introducing any new trade, manufacture, or

invention, or by opening or improving a public road; and they are generally dispensed with in the case of mariners, as it has been the constant policy of Portugal to encourage foreigners to enter and augment its marine.—In Spain, by the ancient law of the realm, no foreigner could be naturalized. The constitutions of 1837 and 1845, however, included in their classification of Spanish subjects those who should receive letters of naturalization, and provided for the enactment of a law declaratory of the conditions upon which such letters would be granted. The present state of the law appears to be unsettled or difficult to ascertain.—Before the various Italian states were formed into the kingdom of Italy, each state had its own regulations in respect to naturalization. In the Two Sicilies ten years' consecutive residence was required, but special naturalization might be granted after one year's residence to any one who had rendered important service to the state. In Sardinia it was granted after five years' residence if the applicant had purchased real estate or was engaged in some useful commercial business. The pope in the Papal States and the king in the Neapolitan dominions might naturalize whom they thought proper; but the exercise of the power was rare, and when it took place was usually upon the same conditions as in Sardinia, except that none could be admitted but Roman Catholics, while in Sardinia no distinction was made on the ground of religion. According to the revised code of the kingdom of Italy of 1866, aliens may become naturalized citizens either by a special act of parliament or by a royal decree. The decree to be effectual must within six months after its date be registered with the proper civil authority of the state in the place where the alien has established or intends to establish his domicile, and the alien must also within that period take an oath before the same authorities that he will be faithful to the king and observe the statutes and laws of the realm. The code does not contain any further regulations on the subject, but the government has discretionary power for taking such informations as each application may seem to require. Hence the necessity of a special act of parliament or a royal decree for each individual naturalization. There is in Italy, besides the national citizenship, a local one, as every Italian citizen must be enrolled in the lists of the district in which he is subject to taxation and conscription; citizenship in fact being of the same general nature as the German burgher right. By the national code above referred to of 1866, if the father is unknown, the child of a citizen mother is a citizen; and if the mother is unknown and the child was born in the kingdom, it is a citizen. A child of an alien who has had an uninterrupted domicile in the kingdom for ten years is a citizen; also the child of a citizen who has lost his citizenship before the birth of the child, if the child was born and resides in the kingdom. In such cases, however, the

child may elect to be considered an alien, upon making a declaration to that effect in a mode prescribed. A child born abroad before his father lost his citizenship is an alien; but he may elect to take the quality of a citizen by making a declaration in a form prescribed and establishing a domicile in Italy for a year; or he is regarded as a citizen if he has served in the Italian army or navy, or accepted public employment in the kingdom, or satisfied the requirements of the conscription without seeking exemption as an alien. If an alien has not established his domicile for ten years, his child is an alien, but by making the prescribed declaration may become a citizen. Citizenship is lost: 1, by making a formal renunciation of it before the civil authority of the province where the person resides and emigrating; 2, by accepting employment from a foreign state or entering its army, without permission of the Italian government; 3, by naturalization in a foreign country. The wife and minor children of one who has lost his citizenship are aliens, unless they have continued to reside in the realm. Citizenship may be restored: 1, by returning to the realm with the permission of the government; 2, by renouncing foreign citizenship, or the employment or military service of a foreign power; 3, by declaring an intention before the proper authority to establish a domicile in the realm, and establishing it within a year.—In Greece, by a law passed May 15, 1835, any foreigner may become a Greek citizen by making a declaration of his intention before the authorities of the deme in which he resides, and after a continued residence in the country for three years from the day when he declared his intention. Upon the expiration of the three years he is naturalized by taking an oath before the prefect of obedience to the laws and of fidelity to the king. From the period of declaring his intention he enjoys all civil rights, and Grecian citizenship may be conferred without expense upon any foreigner who has rendered distinguished service to the state. Any person born in Greece of foreign parents may, when arriving of age, become a Greek citizen by declaring his intention to make Greece his permanent home, and registering his name in a deme, or, if residing abroad, by making a similar declaration, and returning within one year thereafter to Greece and registering his name as above. Every one born abroad of a Greek father is a citizen of Greece; or if the father has lost his nationality, the son may become a citizen by making the declaration and registering his name as above stated. This law declares Greek citizens to be those born in the kingdom and of parents having the Greek nationality, and those who have acquired it by declaring their intention to become citizens; and that the nationality is lost by becoming a citizen of a foreign country, by bearing arms against Greece, or by entering the civil or military service of another nation without ob-

taining special permission from the king, or by a citizen establishing himself abroad in a manner which indicates an intent not to return, but no such intent is to be inferred simply from the fact that a citizen has established himself in another country for commercial purposes.—In Turkey the population is divided into two great classes, the Turks or Mohammedans, the ruling race, and the Rayas (the flock), who with the exception of some few tribes are Christians or Jews. The Rayas are organized in distinct communities, having their own municipal regulations, as Armenians, Bulgarians, Bosnians, Serbs, Latin Christians, or Jews, under a recognized head, as a bishop, patriarch, or other ruler, who is responsible to the sultan for the good conduct of his community. Resident foreigners might become members of one of these communities with the consent of the body, upon giving due notice to the Porte, and when admitted were entitled to the privileges and bound to the obligations of Turkish subjects. This however has probably been modified by a decree of the Ottoman empire of Jan. 19, 1869, which provides that the character of a Turkish subject may be obtained on application to the minister for foreign affairs, if the applicant is of age and has resided five years consecutively within the Ottoman empire, and that this condition may be dispensed with by the government in exceptional cases. By this decree also the nationality of the parents, or of the father, alone determines that of the child, irrespective of the place of birth; and it further provides that a person born of an alien on Turkish territory may within three years after arriving at age claim to become a Turkish subject. Foreigners, not members of one of the Raya communities, are aliens and under the protection of their respective consuls. The Mohammedans enjoy greater privileges than the Rayas, and foreigners of whatever creed or nation may be received into this class upon embracing Mohammedanism. Their naturalization was formerly both a civil ceremony and a religious rite. It consisted in going first to the Porte or the executive authority representing it, in putting on the fez cap, and making a public declaration of faith in the words: "There is no God but God, and Mohammed is his prophet;" and then repeating the same ceremony in the mosque. Circumcision was also required; and when these conditions had been fulfilled, the proselyte was invested with all the rights of a native-born Mohammedan subject. Whether this continues, or has been superseded by the decree of 1869, is not known. In Egypt, Persia, and throughout all the Mohammedan countries, naturalization is effected in the same way, either by embracing Mohammedanism or by being formally admitted a member of one of the other organized communities.—In the European states, with but a few exceptions which have been mentioned, a naturalized foreigner enjoys every civil and political right,

and may hold the highest office. In all of them naturalization is a thing of rather unusual occurrence, the number of foreigners who become permanent residents in any one of them being very limited. Those who do are chiefly devoted to commercial pursuits; and as naturalization, as a general rule, is not essential to enable them to carry on trade or commerce, it is not generally applied for.—In the different West India islands belonging to European powers, the authority to naturalize is generally either vested in the sovereign or his representative, or regulated by a local law. In the island of Cuba, by the Spanish ordinance of Oct. 21, 1817, the captain general may grant letters of license for domiciliation to all resident foreigners, upon their taking an oath of fidelity and submission to the law. These letters entitle them to hold real and personal property, and to the same protection in their persons and property as Spanish subjects; but for the first five years of domiciliation they cannot engage in trade, open a shop, or become owners of ships or vessels, unless in partnership with Spanish subjects. After that time they can become naturalized. They must present their original letter of license to the captain general, and avow their intention to make the island their perpetual residence; and if it appear after due inquiry by the government that they have resided constantly on the island for five years, and are of good moral character, letters of naturalization are granted to them after they have sworn fidelity to the Roman Catholic religion, to the crown, and to the laws, and renounced all foreign allegiance to and every privilege received from any other government. When thus naturalized, they and their legitimate heirs and descendants acquire all the rights and privileges, and are placed upon the same footing as natural-born subjects. But the provision in respect to naturalization, though still in full force, has become practically a dead letter, as natives enjoy but few privileges which resident or domiciled foreigners do not possess.—In Hayti, by a modification of the civil code adopted in 1860, any person who in virtue of the constitution wishes to become a citizen, must within a year after his arrival make an oath before a justice of the peace renouncing allegiance to every other government, upon presenting an official attestation of which at the office of the president of Hayti, he receives from that officer an act recognizing him as a citizen of the republic.—In Mexico two years' residence is required, and one year's previous declaration of intention. This declaration is in the form of a petition to the *ayuntamiento* of the place where the applicant resides. Before he can be naturalized, the applicant must prove before the nearest circuit judge that he is of the Roman Catholic religion, and has a trade, profession, or income sufficient to support him. The documents containing this proof must then be laid before the governor or political chief of the district or territory, and, if

satisfactory, letters of naturalization are granted by that officer to the applicant upon renouncing his former allegiance and swearing to support the constitution; but naturalization cannot be obtained while the country to which the applicant owes allegiance is at war with Mexico. Colonists who settle new lands can be naturalized a year after they have settled, and aliens in the naval service become citizens by taking the oath of allegiance. Citizenship in Mexico is lost by residing abroad for ten years without obtaining a prolongation of the permit to be absent; by accepting honors or offices from a foreign sovereign; by becoming naturalized in another country; by a citizen so establishing himself abroad as to indicate a manifest intention not to return; by a Mexican woman upon her marriage with a foreigner, and by the children of Mexicans born out of the country who do not claim the right before they arrive at the age of 26 years (but this is supposed to be unconstitutional since 1857). The adult children of Mexican parents who have lost their citizenship also lose the right, unless they claim it and reside one year in the country after their right to citizenship is recognized. Finally, any Mexican who in time of war hoists a foreign flag over his house, loses his citizenship, and is punished by banishment. The children of aliens born in Mexico follow the condition of their parents, and are not deemed citizens.—In Brazil three years' previous residence is requisite, after which naturalization is obtained by a joint resolution, which must pass both chambers of the general assembly and be affirmed by the emperor. By a law passed in 1860 children of foreigners born in Brazil have during their minority the political condition of their parents; but on reaching their majority they acquire the rights and become subject to the duties of Brazilian citizens. A Brazilian woman marrying an alien follows his condition, but upon becoming a widow is considered a Brazilian subject if residing in Brazil, or if, returning there, she declares her intention to fix her residence in the country; and a foreign woman marrying a Brazilian has the political condition of her husband. In the Argentine Republic two years' residence in the country is required, or the period may be lessened where services have been rendered to the state. In Peru the governor of a department may grant naturalization upon proof of good conduct, that the applicant has resided in Peru for one year, and that he comes within the requirements of the constitution, and upon his taking the oath of allegiance. In Chili five years' previous residence is necessary; but where an alien has married a native, this period is reduced to four years. In Paraguay foreigners who establish a character for prudence and discretion, and who are not political propagandists, may be naturalized with the consent of the president. In Bolivia citizenship is granted to those who renounce their former allegiance and inscribe their names upon the

civil register. In Venezuela it may be obtained by transmitting a memorial through the governor of a province to the executive, with legal proof of the applicant's good conduct and of his means of subsistence, the names of his wife and children if he have any, and that he has either resided one year in the territory or sailed for six months in a war or merchant vessel of the republic, or owns real estate of a certain value, or is married to a Venezuelan woman, or that he has rendered important service to the state. If approved, letters of naturalization are sent to the governor, who delivers them upon the applicant's taking an oath before him or before the *jefe politico* that he will obey the constitution and laws; and the wife and minor children become naturalized with him, their names and ages being indorsed upon the letters. In Ecuador a foreigner may be naturalized if he owns real estate or \$1,000 in money, or is engaged in some industrial pursuit, upon making known his intention to the governor of a province; in Colombia, by sending a memorial through the governor of a province to the executive, stating the applicant's nationality, and the names of his wife and children if he have any, and by taking an oath to obey the constitution and laws and renouncing his former allegiance, his wife and minor children becoming naturalized with him.—In the states of Central America the more general rule is, as in Brazil, to naturalize the alien either by the executive or by a legislative act. In Costa Rica an application must be made to the president of the republic, accompanied by proof that the petitioner has resided there six years, of his good conduct during that period, and of his having honest means of subsistence. Letters of naturalization are then granted him by the president on renouncing his previous national allegiance. In Honduras a foreigner is naturalized by acquiring real estate and a residence of four years, but if one marries a Hondurian wife this period is reduced to two years; or a letter of naturalization may be obtained from the legislature for services rendered to the state, for an important improvement in agriculture or the arts, or for introducing a new manufacture in the country. In San Salvador he is naturalized by acquiring real estate and a residence of five years, or by contracting marriage with a Salvadorian woman and a residence of three years, or by obtaining a letter of naturalization from the legislative body in the same way and for the same causes as in Honduras. In Nicaragua letters of naturalization may be granted by congress after two years' residence in the republic. In most of the states of Central America naturalization is granted by the legislature to resident foreigners generally upon application, without insisting upon any conditions; the clause that it is upon the ground of important services to the state, &c., being usually inserted in the letters of naturalization as a mere matter of form.—

In the foregoing enumeration some countries are omitted, because their laws could not be accurately ascertained, and many countries of Asia and Africa are not noticed for the reason that they have no regulations upon the subject. In the largest of these countries, China, foreigners are by the imperial code perpetually excluded, except within certain prescribed limits, unless where provision is made for more extended privileges by treaty.

NATURAL PHILOSOPHY, a term formerly used to include all those sciences which relate to the material universe, in contradistinction to those which relate to the mind or metaphysics. The wide extent of the term and its consequent vagueness have led to a gradual restriction of its application, until at present it embraces only mechanics and physics. For the former, see the article **MECHANICS**. The term physics is usually considered as including the sciences of hydromechanics, pneumatics, acoustics, heat, light, electricity, and magnetism. Each of these will be found treated in this *Cyclopædia* under its appropriate head.

NAUHEIM, a watering place of Hesse-Darmstadt, Germany, 17 m. N. of Frankfurt; pop. about 2,500. The salt works here are of great antiquity, but baths were first established in 1834, and the number of visitors is now about 3,000 a year. A fountain bored in 1838 down to the bed of natural salt gave out in 1848, but a new one soon took its place. In December, 1846, a slight shock of earthquake brought forth another fountain from a hole bored some years before. This affords water for the old and new bath houses, and produces annually 75,000 quintals of salt. A still more recent fountain, the Friedrich-Wilhelm's Sprudel, discharges a column of water 12 in. in diameter from the top of a shaft 15 ft. high. These waters, used both for bathing and drinking, are efficacious in diseases of the skin and bowels. The Kurhaus is a fine building surrounded by a park. Gaming tables, which formerly existed, have been abolished. The mineral waters of Nauheim and vicinity are largely exported.

NAUMANN, Johann Friedrich, a German ornithologist, born at Ziebigk, near Köthen, Feb. 14, 1780, died in Köthen, Aug. 15, 1857. He was the son of the ornithologist Johann Andreas Naumann, studied at Dessau, and devoted himself especially to the study of the birds of Germany. Besides other works, he published *Naturgeschichte der Vögel Deutschlands* (13 vols., Leipsic, 1822-'52), embellished by plates, a large number of which he engraved himself.

NAUMANN, I. Johann Gottlieb, a German composer, born at Blasewitz, near Dresden, April 17, 1741, died in Dresden, Oct. 23, 1801. When 13 years of age he went to Italy, and afterward settled in Venice, where he remained eight years, teaching and composing music. In 1765 he returned to Dresden, and was appointed composer to the elector of Saxony. Shortly after he made a second journey to Italy, and in 1772 a third, when he resided two years at

Rome, and in 13 months composed five operas. In his later years he composed much church music. Among his operas are "Cora," "Amphion," "Orpheus," and "Gustavus Vasa."

II. Karl Friedrich, a German mineralogist, son of the preceding, born in Dresden, May 30, 1797, died in Leipsic in January, 1874. He was educated at Freiberg, Leipsic, and Jena, made a scientific journey to Norway in 1821 and 1822, and published *Beiträge zur Kenntniss Norwegens* (2 vols., Leipsic, 1824). In 1826 he succeeded Mohs in the chair of crystallography at Freiberg, and in 1835 was also appointed professor of geognosy. In 1842 he went to the university of Leipsic as professor of mineralogy and geognosy, and in 1866 he was made privy counsellor of mines. Among his remaining works are: *Anfangsgründe der Krystallographie* (Dresden, 1841; 2d ed., 3 vols., Leipsic, 1854); *Elemente der Mineralogie* (8th ed., 1871); and *Lehrbuch der Geognosie* (1850; 2d ed., 3 vols., 1858-'67). **III. Moritz Ernst Adolf**, a German physician, brother of the preceding, born in Dresden, Oct. 6, 1798, died in Bonn, Oct. 19, 1871. He took his degree at Leipsic, and was adjunct professor there in 1824-'5, and subsequently in Berlin till 1828, when he became professor at Bonn. Among his works are: *Handbuch der medicinischen Klinik* (8 vols., Berlin, 1829-'39; 2d ed., 11 vols., 1839-'47); *Pathogenie* (3 vols., 1841-'5); *Allgemeine Pathologie und Therapie* (1851); *Ergebnisse und Studien aus der medicinischen Klinik zu Bonn* (2 vols., Leipsic, 1858-'61); and *Die Naturwissenschaften und der Materialismus* (Bonn, 1869). **IV. Emil**, a German composer and author, son of the preceding, born in Berlin, Sept. 8, 1828. He studied under Mendelssohn, and in 1848 produced his first important work, the oratorio *Christus der Friedensbote*. About 1852 he published *Die Umgestaltung der protestantischen Kirchenmusik*, and was soon after appointed director of church music at Berlin. Among his compositions are the cantata *Zerstörung Jerusalem's*, the operas *Judith* and *Mühlenhexe*, the overture to *Lorelei*, and many pieces of church music. He has published *Ueber die Einführung des Psalmengesanges in der evangelischen Kirche* (1856), and *Die Tonkunst in der Culturgeschichte* (1869-'70).

NAUMBURG, a fortified town of Prussia, in the province of Saxony, on the Saale, near the junction of the Unstrut, 23 m. S. S. W. of Halle; pop. in 1871, 15,120. It is an active manufacturing and commercial town, but the once famous fair of Naumburg has lost its importance. Among the principal buildings are the cathedral, one of the finest specimens of German mediæval architecture, remarkable for its lofty towers and double choir, completed in 1349, and the restoration of which was begun in 1874, and the church of St. Wenceslas, with a famous picture of "Christ blessing Little Children," by Cranach. It is the seat of the Protestant cathedral chapter of Naumburg-Zeitz, and has one Roman

Catholic and four Protestant churches, a gymnasium, and several other schools of a high grade. An annual children's festival is celebrated here, in commemoration of the raising of the siege by the Hussites under Procopius,

by a blow upon the head, and in sensitive persons by offensive odors, by sudden alternations of temperature, and even by disagreeable news or moral impressions. When followed by vomiting, it is usually relieved immediately

upon the evacuation of the stomach. If not so relieved, and if long continued, it becomes excessively depressing, and may even be dangerous to life. If the sensation of nausea be excited by any substance which has been taken into the stomach, the best treatment is to favor the act of vomiting by copious draughts of warm water, and thus secure an early and complete evacuation of the stomach. If it depends upon any other of the causes named, quiet, a horizontal position, and freedom from all sources of disturbance, are most effectual.

Naumburg.

which according to tradition took place July 28, 1432, in consequence of the entreaties of the children of Naumburg. This event has been dramatized in Kotzebue's *Die Hussiten vor Naumburg*, but its authenticity has been called in question by recent historians. Several treaties were concluded at Naumburg in the 15th and 16th centuries, and the town was of strategical importance during the thirty years' war and the wars of 1806 and 1813.

NAUPACTUS. See LEPANTO.

NAUPLIA, or **Napoli di Romania**, a seaport town of Greece, in the nomarchy of Argolis and Corinth, and capital of an eparchy of its own name, on the gulf of Argolis, 58 m. S. W. of Athens; pop. in 1870, 8,543. The three forts which protect it make it the strongest maritime town of Greece. It is the seat of a Greek archbishop, of a court of appeal, and of a court of primary jurisdiction. The town has seven churches, a gymnasium, and an arsenal. From 1824 to the end of 1834 it was the seat of the government of Greece. In 1831 Capo d'Istria was assassinated here, and in 1833 Otho, the first king of restored Greece, landed at the port. In antiquity Nauplia was the port of Argos.

NAUSEA (from Gr. *ναῦς*, a ship, from its presence in sea sickness), the sickening sensation at the pit of the stomach which usually precedes vomiting. Nausea may be produced by a variety of causes: by the introduction into the stomach of nauseating or emetic drugs, by continued rotation or swinging of the body, by the unaccustomed motion of a vessel upon the waves, by food which disagrees with the stomach either in quantity or quality, sometimes

NAUSHON. See ELIZABETH ISLANDS.

NAUTILUS (Gr. *ναυτίλος*, from *ναῦς*, a ship), a name applied to both the tetrabranchiate and dibranchiate orders of the cephalopod mollusks. In the former the true or pearly nautilus is the best known species of the only living genus representing the extinct chambered shells (such

Pearly Nautilus (*Nautilus pompilius*).

as ammonites, orthoceratites, turrilites, &c.) which abounded during the primary and secondary geological ages; in the latter belongs the nautilus of the ancients (the paper nautilus of the moderns), more properly called argonaut. For the characters of the class and orders see CEPHALOPODA, and MOLLUSCA.—The

genus *nautilus* (Linn.) has a discoid, symmetrical, univalve shell, with simple aperture, suture, and siphuncle. The organization of the pearly nautilus (*N. pompilius*, Linn.) was first made known by Prof. Owen in 1832, and afterward by Gray, Grant, De Blainville, Van der Hoeven, Valenciennes, and Huxley. The posterior portion of the body, containing the viscera, is soft, smooth, and adapted to the anterior chamber of the shell; the anterior is muscular, including the organs of sense and locomotion, and can be retracted within the shell; the mantle is very thin behind, and prolonged through the calcareous tube of the occupied chamber as a membranous siphon, and through all the divisions of the shell to the central nucleus; on the upper part of the head is a broad triangular muscular hood, the back part excavated for the involuted convexity of the shell, protecting the head when retracted, and used as a foot for creeping at the bottom of the sea with the shell uppermost. On each side of the head are 20 perforated digitated processes of a conical form, each containing a long finely ringed tentacle, whose inner surface is closely set with narrow transverse plates; the eyes, large and prominent, are placed on short pedicels on the side of the head behind the digitations; the subocular processes have no tentacles, and are rudimentary external ears, their cavity extending to the auditory capsule. The mouth has two horny mandibles, like the beak of a parrot reversed, the lower overlapping the upper, moving vertically, and implanted in thick muscular walls; the surrounding circular fleshy lip has 4 labial processes, each pierced by 12 canals, containing each a small retractile tentacle, making, with the 38 digital and 4 ophthalmic, 90 tentacles on and around the head. The internal cartilaginous skeleton is confined to the lower surface of the head, a part of the cephalic nervous system being protected in a groove on its upper surface, and the two great muscles which fix the body to the shell are attached to it. The funnel is very muscular, and is the principal organ of free locomotion, the animal being propelled backward by a succession of jerks occasioned by the reaction of the ejected respiratory currents against the surrounding water. The capacious crop opens into an oval muscular gizzard; the intestine terminates in the branchial cavity near the base of the funnel; the liver is bulky, and the bile is derived from arterial blood; there is no ink gland. Sea water is admitted into the pericardium; the branchiæ are two pairs without branchial hearts, the larger branchia supporting 48 vascular folded plates on each side, the smaller 36; the large veins near the heart have clusters of follicles attached to them, according to Owen seeming to be homologous with the so-called renal glands of lower mollusks; by some they are considered as diverticula to relieve the circulation during the varying pressures to which the animal is subjected. The tongue is furnished with

numerous papillæ and spines. The nautilus, though the lowest of the cephalopods, approaches the vertebrate type nearer than any other invertebrate, in the perfect symmetry of the organs, the larger proportion of muscle, the increased bulk and concentration of the nervous centres in and near the head, the vertical opposition of the jaws, the gustatory papillæ of the tongue, and the cartilaginous cephalic skeleton. Its food consists of other mollusks and of crustaceans, showing that its natural habitat is the bottom of the sea, where it creeps about shell upward. The parts of the shell progressively vacated during the growth of the animal are successively partitioned off into air-tight chambers by thin smooth plates concave toward the opening, with sinuous margins, growing from the circumference toward the centre, and pierced by the membranous siphon. The young animal, before the shell becomes calcareated, cannot rise from the bottom; but the older ones can come to the surface by changes in the expansion of the soft parts, by a slight vacuum produced in the posterior part of the occupied chamber, and according to some by the exhalation of some light gas into the deserted chambers; they rise in the water as a balloon does in the air, with the ability also of directing the motions to a certain extent by means of the funnel; they float at the surface shell upward, and sink quickly by reversing the shell. The proportion of the air chambers to the dwelling chamber is such that the shell is nearly of the same specific gravity as the water; the siphon communicates with the pericardium, and is probably filled with fluid from that cavity; it conducts small vessels for the nutrition of the shell, and perhaps for secretory purposes. A large and perfect shell will weigh 6 or 7 oz., and the soft parts 5 or 6 oz. more; the exterior crust of the shell is whitish with fawn-colored streaks and bands, and the interior has a beautiful pearly lustre, and is in request by cabinet makers and jewelers; by removing the external coat by acids, the pearly surface is readily exposed, and shells thus treated and richly engraved were formerly highly prized as ornaments for the mantle-piece and sideboard. This species is so common in the S. Pacific, that at certain seasons of the year they are carried by the winds and currents to the island shores, where they are used, when smoke-dried, for food; in the Papuan archipelago the shells are used as common utensils; they are found from the Persian gulf and Indian ocean to the Chinese seas and the Pacific. In the umbilicated nautilus (*N. umbilicatus*, Lester) the last whorl of the shell does not envelop and conceal the others; the shape is ventricose, the surface reticulated, and the color dusky smoky, with numerous delicate chestnut flammules (five to the inch). A nautilus extended in a straight line would be a shell like a fossil orthoceras; in the ammonites the shell is coiled as in the nautilus, but is strengthened by arched ribs and dome-

shaped elevations on the convex surface.—The paper nautilus or argonaut belongs to the octopod group of the dibranchiate cephalopods, or to the *acetabulifera* of D'Orbigny, from the arms being provided with sucking disks. It differs from the true nautilus in the arms of larger size and more complicated structure, partially connected by membrane at the base; in the larger and more complex eyes, not pedunculated but lodged in orbits; in the gills being only two in number, each with a branchial heart; in the funnel being an entire tube; and in the presence of an ink gland and bag for its secretion. In the genus *argonauta* (Linn.), in the females, which alone have a shell as an egg receptacle, the first or dorsal pair of the eight arms are dilated into broad thin membranes, which secrete and sustain the very light, paper-like, calcareous, symmetrical, and single-chambered shell; like the other arms, these are provided with two rows of suckorial disks, extending around the whole circumference, by means of which the animal retains the shell in position; the six non-palmated arms serve as organs of prehension and locomotion, as the animal drags itself along the bottom or climbs the rocks in search of food, and as anchors; the shell, as in the nautilus, is carried above the body. The arms are attached to the anterior part of the cephalic cartilage; the suckers are completely under the control of the animal, which can fasten or relax them instantly. Swimming is effected in a retrograde manner by the ejected currents from the funnel. The skin is soft and tender, and includes a great number of cells containing pigment matter of different colors, whose contractions and expansions, with the surface movements, give it a remarkable power of rapidly changing its tints. There is no internal shell, and it is now ascertained that the external shell is peculiar to the female, and is only an incubating and protective nest for the eggs; it is not the homologue of the internal rudimentary shell of the cuttle fish, nor of the external chambered shell of the nautilus, but rather answers to the cocoon of leeches and other articulate, or to the egg-float of the delicate gasteropod *janthina*; the eggs are attached by thread-like stalks to the involuted

ments which determined that the argonaut is the maker of its own shell, and not a parasitic occupant like the hermit crab; this question arose from the fact that the animal has no muscular or other attachment to the shell, and has been known voluntarily to quit it, and survive in captivity a considerable time without any attempt to return to it; it also repairs the shell when broken by the agency of the palmated arms. For an account of the arguments for and against parasitism (among the advocates of the former being Lamarck, Leach, De Blainville, Broderip, and Sowerby, and among those of the latter Cuvier, Duvernoy, Férussac, and D'Orbigny), and for an extensive bibliography on this animal, see "Proceedings of the Boston Society of Natural History," vol. v., pp. 369-'81 (1856). Leach, who considered the animal a parasite, described it as the genus *oocythoë*. The sexes are distinct; the specimens usually found are all females, the males having been until recently described as parasites under the name of *hectocotylus*; this is a worm-like body, resembling the arm of a cuttle fish, the under surface bordered with 40 or 50 pairs of alternating suckers; for a long time regarded as a parasitic annelid, it is now known to be the spermatophorous arm of the male argonaut, deciduous during sexual congress, and attaching itself within the mantle of the female; in this genus it is the third arm of the left side which is thus deciduous and hollowed for the spermatoc receptacle. The male argonaut has no shell and no palmated arms, and is only about one eighth of the size of the female. The argonaut, according to Rang, rises to the surface shell upward, turning it downward when it floats on the water; by retracting the six arms within the shell and placing the palmated ones on the outside, it can quickly sink, explaining why the animal is so rarely taken with the shell. The shell is flexible in the water, but very fragile when dry; after having been soaked in water for some time it may be bent as before. A specimen, one of the largest known, in the cabinet of the Boston society of natural history, is 10 in. long, 6½ broad, and the opening 4 in. wide; it cost the donor \$500. Many species are described.

NAUVOO, a township of Hancock co., Illinois, on a bend of the Mississippi river, near the head of the lower rapids, 52 m. above Quincy and 220 m. above St. Louis; pop. in 1870, 1,578. The city of Nauvoo was founded by the Mormons in 1840, and contained about 15,000 inhabitants at the time of their expulsion in 1846 by the neighboring people. It was regularly laid out with broad streets crossing at right angles, and the houses were built generally of logs, with a few frame and brick buildings interspersed. A temple 130 ft. long by 90 wide was erected of polished limestone. The baptistery was in the basement, and held a large stone basin supported by 12 colossal oxen. In 1848 this building was set on fire by an incendiary, and all destroyed except the

Paper Nautilus (*Argonauta argo*).

spire of the shell, behind and beneath the body of the female. The best known species, the *A. argo* (Linn.), inhabits the Atlantic, Pacific, and Indian oceans, and the Mediterranean, especially about Sicily. In the last named locality Mme. Jeanette Power made the experi-

walls, which on May 27, 1850, were overthrown by a tornado. In 1850 Nauvoo was occupied by M. Cabet, a French communist, with a small body of followers, called Icarians; he died in 1856, and his community was broken up in the following year. Two weekly newspapers (one German) are published.

NAVAJOS, the most northerly band of the Apache Indians, inhabiting the table lands and mountains of a district on the San Juan and Little Colorado, called by the Spaniards Navajoa, whence they were styled Apaches de Navajoa. They call themselves Yutahenne. They are by far the most civilized tribe of the Athabascan stock, having evidently acquired many arts from the semi-civilized Indians of New Mexico. They cultivate the soil rudely but extensively, Col. Baker in 1859 estimating their farms at 20,000 acres; and having at an early period obtained horses, cattle, sheep, and goats, they soon had large herds and flocks, and learned to spin and weave cotton and wool. Their blankets are highly prized, bringing from \$80 to \$150. Their houses however are very rude, being merely conical structures of poles, covered with branches. Like all the Apaches, they have warred on the Mexicans from an early period. When they came within the limits of the United States they occupied Sevolleta and nine other fixed towns, all under one head chief. The Mexicans frequently attempted to reduce them. Doniphan's expedition in 1846, Wilkes's in 1847, Newby's in 1848, and Washington's in 1849 were failures. Sumner in 1851 pushed into the heart of their country, and planted Fort Defiance at Cañoncito Bonito, but was forced to retreat. A series of treaties were broken as soon as made; and the Navajos kept on killing and plundering till Col. Carson in 1863, in a winter campaign, conquered and compelled them to leave their country and remove to Bosque Redondo, on Pecos river, at a distance from their fastnesses. Here they were held as prisoners by government to the number of 7,000 for several years, at great expense. But they were constantly exposed to attacks from the Comanches and other hostile tribes; the site was unhealthy, the soil poor, and the water bad. On June 1, 1868, Gen. Sherman and Col. Tappan as commissioners concluded a treaty, and the next month the Navajos were removed to Fort Wingate, and in 1869 to their old country around Fort Defiance, 6,120 square miles being assigned as their reservation. One band, Sandoval's, has been friendly from the first. In 1872 the Navajos on the reservation numbered 9,114, with three outlying bands. They had 130,000 sheep and goats, 10,000 horses, and some cattle. They were peaceful and well disposed, and received \$91,000 a year in annuities. In 1870 a Presbyterian mission and school were established, but the school soon ceased. The Navajos are distinguished by a full round eye. They dress decently, covering the whole body, in textures of their own weaving, generally of

bright colors; and the warriors wear a helmet-shaped deerskin cap with feathers. Their arms are bows, lances, and rawhide shields.

NAVARINO, or *Neocastro*, a fortified town of the Morea, Greece, in the nomarchy of Messenia, at the S. extremity of the bay of Navarino, 5 m. N. of Modon (Methone), and 3 m. from Old Navarino, which stands on the N. coast of the bay, near the ruins of Messenian Pylos; pop. about 2,000. It has a citadel, situated on a high rock. The chief objects of interest are the remains of an old aqueduct, and some antique marble pillars adorning the front of a former mosque. The bay of Navarino is about 3 m. long and 2 m. wide, with from 12 to 26 fathoms of water. It is shut in by the island of Sphacteria or Sphagia, famous for the victory achieved there by the Athenian Cleon over the Spartans, 425 B. C. Here, on Oct. 20, 1827, the combined fleets of Great Britain, France, and Russia, under Codrington, Rigny, and Heiden, destroyed the Turkish-Egyptian fleet, which greatly promoted the success of the Greeks in their struggle for independence.

NAVARRÉ (Span. *Navarra*), a N. province of Spain, between Aragon, Old Castile, and Biscay, bounded N. by France and the Pyrenees, E. by the provinces of Huesca and Saragossa, S. by Saragossa and Logroño, and W. by Álava and Guipúzcoa; area, 4,045 sq. m.; pop. in 1870, 318,687. The country generally is intersected by small mountain ranges projecting southward from the Pyrenees; but near the banks of the Ebro, which forms a part of the southern frontier, there are wide and fertile plains. Besides that river, Navarre is watered by its affluent the Aragon, which, coming from the northeast, receives several smaller streams, running due S. from the mountains; in the southwest by the Ega, another affluent of the Ebro; and toward the northwest by the Bidassoa, which falls into the bay of Biscay. While the mountainous region is mostly bleak, cold, and unsuitable for tillage, the valleys are fertile in wheat, maize, barley, and oats. Hemp, flax, oil, wine, and liquorice are also produced; it is principally a grazing and agricultural district, and manufactures are in a very backward state. The canal of Aragon, which connects Tudela and Saragossa, affords means of intercourse with the adjoining provinces on the east, and the province is also connected by railways W. and S. with the principal cities in Spain. It communicates with France by railway N. to Bayonne, and by roads through mountain passes or defiles, the most celebrated of which is that of Roncesvalles, where the army of Charlemagne was defeated. In the mountains, besides the Pyrenean limestone, jasper, slate, and marble occur in large beds; there are iron, copper, and lead mines, numerous thermal springs, salt springs, and mines of rock salt. The forest trees of the Pyrenees, chiefly consisting of pines, beeches, oaks, and chestnuts, furnish an

abundant supply of building timber. Wolves, wild boars, foxes, and wild cats are found in the mountains. The principal occupation of the people is pasturing sheep, goats, and cattle. Wool, grain, hides, salt, and wine are the chief exports, and silk and cotton fabrics and colonial produce the most important imports. The Navarrese are tall and well formed, and evince an independent spirit and great attachment to their religion and ancient privileges. The Castilian language is generally used among them; but the Basque is spoken in the N. W. and W. districts. The principal towns are Pamplona, the capital, Tudela, Estella, and Tafalla.—This province, which is sometimes termed Upper Navarre, once formed a kingdom, in conjunction with Lower Navarre, which is situated on the northern slope of the Pyrenees, within the limits of France. It was one of the first Christian principalities founded after the conquest of Spain by the Arabs, and, although occasionally overrun by those invaders, was never subdued. It acknowledged for a while the supremacy of Charlemagne and his immediate successor, Louis le Débonnaire; but about the middle of the 9th century it vindicated its independence, which was sanctioned in 887 by the diet of Trebur. At the beginning of the 11th century, under Sancho III., surnamed the Great, its limits were considerably enlarged; and it was for a while the most powerful among the Christian kingdoms of Spain. In 1234 it fell by inheritance to Thibault, count of Champagne, whose granddaughter Jeanne in 1284 married the future Philip the Fair of France; and on the accession of that prince to the throne in the following year, Navarre was united to France. This union lasted 43 years; and on the accession of Philip VI. of Valois, Navarre returned to its own sovereigns. Jeanne, the daughter of Louis X. of France, the lawful heirless, brought the Navarrese crown to the house of Évreux, from which, by intermarriage, it passed in succession to the houses of Aragon in 1425, of Foix in 1479, and finally of Albret in 1494. The whole of Spanish Navarre was in 1512 seized by Ferdinand the Catholic, king of Aragon; and henceforth the kingdom was limited to the small district known as French or Lower Navarre. By the marriage of Duke Antoine to Jeanne d'Albret Navarre was acquired by the house of Bourbon, and their son Henry of Navarre, in 1589, inherited the throne of France. His successors, until 1830, styled themselves kings of France and Navarre. During the Carlist struggles in 1834-'9 and in 1872-'5 the province was a principal seat of war, it being mainly occupied by the Carlists. Estella, their chief stronghold, was captured by the Alfonsists in February, 1875.

NAVARRETE, Domingo Fernandez, a Spanish missionary, born at Peñaflor in 1610, died in Santo Domingo in December, 1689. He joined the Dominican order, and in 1647 was sent to the Philippine islands, and became professor of theology at Manila. Visiting China, he

penetrated into the interior of the empire, and was for some years superior of his order there; but during a persecution he was apprehended and sent to Canton, whence he escaped to Macao, took ship for Europe, and reached home in 1673. In the same year he went to Rome, and protested to the pope against the policy of the Jesuit missionaries in China, whom he accused of accommodating themselves to the ceremonies of the natives. In 1678 he was appointed archbishop of Santo Domingo. He published *Tratados históricos, políticos, éticos y religiosos de la monarquía de China* (fol., Madrid, 1676). A second volume of this work was suppressed by the inquisition, and a third was written but never printed.

NAVARRETE, Juan Fernandez, surnamed EL MUDO (the Mute), a Spanish artist, born in Logroño in 1526, died about 1575. He became deaf and dumb in his infancy, studied painting in the monastery of the Hieronymites at Estrella, and afterward in Italy, and was a pupil of Titian. He devoted himself to sacred subjects, and nearly all his works are in the Escorial.

NAVARRETE, Martino Fernandez, a Spanish historian, born at Abalos, Old Castile, Nov. 9, 1765, died in Madrid, Oct. 8, 1844. He entered the navy in 1780, was present at the attack on Gibraltar in September, 1782, and afterward served against the Moors and Algerines. In 1789 he was commissioned by the Spanish government to compile from the national archives a collection of documents on the history of Spanish maritime discovery. He returned to sea when war was declared with France, and remained afloat until he was appointed in 1797 to a post in the ministry of marine. On the French invasion in 1808 he retired to Seville. Returning to Madrid in 1814, he engaged in literary labors, proposed the new system of orthography adopted by the Spanish academy in its dictionary, and wrote a "Life of Cervantes" (Madrid, 1819). In 1823 he was made chief of the hydrographical department. The first two volumes of the work to which he devoted the best part of his life were published at Madrid in 1825, under the title of *Coleccion de los viajes y descubrimientos que hicieron por mar los Españoles desde fines del siglo XV*. The third appeared in 1829, and the fourth and fifth in 1837. The sixth and seventh were left unfinished at the author's death. The first two volumes are devoted to the discoveries of Columbus, concerning whom they brought to light from the national archives an immense wealth of information, consisting of letters, public documents, &c., which were the basis of Washington Irving's "Life of Columbus." Navarrete began in 1842, with two associates, a "Collection of Unpublished Documents for the History of Spain," of which five volumes appeared during his lifetime, and it was continued after his death. He published a treatise on the Spanish discoveries on the Pacific coast of North America, prefixed to a narrative of

the "Voyage of the Sutil and Mexican on the Coasts of California" (1802). His *Disertacion sobre la historia de la nautica española* was published in 1846, and his *Biblioteca maritima española*, in 2 vols., in 1851.

NAVARRO, a N. E. county of Texas, bounded N. E. by the Trinity river, by branches of which it is drained; area, 1,040 sq. m.; pop. in 1870, 8,879, of whom 2,245 were colored. It has a rolling surface, with a rich, dark soil along the watercourses, and a large portion of prairie. It is traversed by the Houston and Texas Central railroad. The chief productions in 1870 were 219,865 bushels of Indian corn, 5,150 of sweet potatoes, 4,077 bales of cotton, and 2,935 lbs. of wool. There were 9,244 horses, 1,151 mules and asses, 4,875 milch cows, 2,459 working oxen, 32,783 other cattle, 7,144 sheep, and 16,419 swine. Capital, Corsicana.

NAVEZ, François Joseph, a Belgian painter, born in Charleroi, Nov. 17, 1787, died in Brussels in 1869. He studied at Brussels, won a prize at Ghent, became a pupil of J. L. David in Paris, and subsequently visited Italy. On returning to Brussels he rapidly rose to be the most eminent master of the academical school of painting, and became director of the academy of fine arts and professor in the normal school. Among his works are: "Hagar in the Desert," "Meeting of Isaac and Rebecca," "Raising of the Son of the Samaritan Woman," "The Prophet Samuel," "The Ascension of the Virgin," "Marriage of the Virgin," "Jesus Sleeping," and "The Virgin and the Infant Jesus."

NAVIGATION, the art or system of rules and practices by means of which vessels are directed in their course upon the water. Prior to the invention of the mariner's compass navigation was limited to enclosed seas like the Mediterranean, to gulfs and archipelagos, and to the coasts. Beyond the sight of land, the mariner had no guide in cloudy nights, and no resource in stormy weather; consequently, the most remote and venturesome expeditions only moved along the shore; and the sea was avoided as much as possible, especially during the winter season, from the middle of November to the middle of March. The discovery of the mariner's compass changed this state of things entirely, by furnishing a never-failing guide, as useful and safe to the navigator in the night as during the day, and in storms as in fair weather. It is uncertain to whom the world is indebted for the first observation of the directing powers of the magnet, and for their application to the purposes of travelling by land and sea. (See COMPASS.) The introduction to Churchill's "Collection" contends for the honor of the discovery in behalf of Flavio Gioja of Pisanò, near Amalfi, in Campania. The date assigned to Gioja's invention is about the beginning of the 14th century. There can be no doubt that to him belongs the merit of having invented something by which its adaptation to nautical purposes was very much promoted;

but that it was used at sea before his time appears from various passages in authors of an older date. It was known in China many centuries previous to its introduction into Europe, and was used in the eastern portion of the Mediterranean during the first half of the 13th century.—When ships, carrying with them an unfailing guide to direct their course, began to traverse the great seas in all directions, the cross staff and the astrolabe furnished them with the means of measuring the altitude of the sun and stars, and thus of approximately determining the latitude and time. But the most serious inconvenience arose from the unavoidable use of a plane chart to represent the sphere, the gross distortions and errors of which often misled the mariner, especially in voyages far distant from the equator. Recourse was had to globes to remove this evil, and a famous pair is mentioned which was made in 1592, under the direction of Mr. William Sanderson, a merchant, "commended for his knowledge as well as generosity to ingenious men." On the terrestrial one were described the voyages of Drake, Cavendish, and Frobisher. The plane chart, however, being so much more easy and convenient in practice, kept its place until the invention of the projection of the sphere upon a plane surface by Gerard Mercator, in 1569. Mercator's projection consists in keeping the meridians parallel, but augmenting the length of the meridians between the parallels of latitude, in receding from the equator, in such a manner that the just proportions of the meridians and parallels of latitude to each other are preserved. The signal advantage of this projection is, that the directions of the compass, or what in technical language are called the "compass courses," are straight lines. The navigator works most conveniently upon a plane surface, and by means of Mercator's projection he is able to lay down his courses with a parallel rule, the points being taken from a compass drawn on the chart, and the line being one that cuts all the meridians at the same angle, and marks the magnetic bearing of the objects through which it passes. This is called the rhumb line or loxodromic curve, and the definition of it answers for the definition of the compass course. Such is the suitability of Mercator's projection to the use of the mariner's compass, that the latter now seems to have been an incomplete discovery until the announcement of the former. It is suggested that Mercator arrived at his invention by simply observing on the globe where the meridians were cut at each parallel of latitude by the rhumb lines; and it is admitted that he never laid down, if he knew it, the mathematical theory on which it rests. This was first announced by Edward Wright, of Caius college, Cambridge. Shortly after this (1595), the famous navigator Capt. John Davis, who gave his name to the straits which he discovered, published a small treatise called "The Seaman's Secrets," at the end of which he gives a figure of a staff of his contrivance,

to make a back observation; "than which instrument," he said, "the seaman shall not find any so good, and in all climates of so great certaintie." The celebrated Portuguese mathematician Pedro Nunez, or Nonius, had as early as 1537 published his book, which, with additions, was printed 30 years afterward by Basil in Latin, and called *De Arte et Ratione Navigandi*. In this he introduces, among much of what was then very valuable matter, his method of the division of a quadrant by concentric circles. Davis's back staff maintained the first place until it was superseded by the quadrant. Another important invention is the log, first mentioned by Pigafetta in the early part of the 16th century. About the year 1620 logarithms were introduced into navigation by Edmund Gunter, whose scales are of such general repute; and shortly afterward Richard Norwood published his method of setting down and perfecting a sea reckoning, with the use of a traverse table. In 1700 Dr. Halley published a general map on which were delineated the lines of equal variation. It was hailed with great applause, as the means of determining the longitude at sea; but this expectation proved futile. But of all the gifts to the navigator, by far the greatest of this time is Hadley's quadrant. It has been superseded by the sextant, which does not differ from it in principle, but is very much more nicely constructed, and more accurate, convenient, and generally useful. (See QUADRANT, and SEXTANT.) For a long time the problem of the longitude engaged the attention of the men of science in Europe, and especially in Great Britain. The British house of commons has at various times offered rewards for the solution of this problem, one of which amounted to £20,000 sterling. Newton's improvement of the theory of the moon led to the construction of Mayer's lunar tables, and to the publication of the "Nautical Almanac and Astronomical Ephemeris," by Dr. Maskelyne, in 1767. The appearance of the latter created a new era in navigation, to which it rendered essential service. The lunar method, as it is called, has since received great additions, corresponding to the advancing state of astronomical knowledge, and the improvements in the instruments of the seaman and the astronomer. The method by the chronometer owes its highest success to the science and ingenuity of English artists and mechanics of the present generation, and that immediately preceding. (See CLOCKS AND WATCHES, and LONGITUDE.) In our day the art or science of navigation has not failed to receive valuable accessions; such as Sumner's method for determining the position by lines of bearing or of equal altitudes; Chauvenet's great circle protractor, which furnishes great circle courses immediately by inspection, saving a world of figures, and also solves in the same way the problems of nautical astronomy; precise and trustworthy sailing directions and memoirs, like those of Horsburgh,

the Blunts of New York, Findlay, and the invaluable memoirs of Kerhallet; and valuable contributions to our knowledge of the laws of storms by Redfield, Reid, and Piddington, and of the currents and meteorology of the ocean generally by Berghaus, Keith Johnston, and Maury.—Without attempting a scientific treatise on navigation, we may give the general reader a simple conception of the manner in which the place of a ship and her direction are ascertained upon the sea, under favorable circumstances. When the ship has left port, the reckoning is begun by observing the compass bearing and distance of some conspicuous object, as a lighthouse; and from the time of taking this bearing the reckoning is continued by noting down (generally from hour to hour) the courses sailed, which are ascertained by observations of the compass, and the distance on each course, which is ascertained by the log. (See LOG.) The reckoning is made up with these data, from the time of any independent determination of the ship's position, by considering the sum of the distances sailed in the N. and S. and E. and W. directions, and reducing the whole to one residual expression of the actual course and distance made good; this is done by means of a traverse table invented for the purpose. The reckoning here described is called dead reckoning, and is susceptible of error from so many disturbing causes, that it can only be depended upon for a short time. The navigator is provided with simple and easy methods of acquiring a knowledge of his position by independent observations of the sun, moon, and stars. We will look only at the first of these luminaries. The elements of position are the latitude and longitude. The determination of the latitude by the altitude of the sun at noon is readily understood, if it be remembered that if the sun moved always on the equator, the height it reached at noon at any place would depend merely on the distance of that place from the equator; but the sun being removed from the equator more or less, according to the season of the year, the navigator reduces it to that circle by applying the declination, which is the astronomical expression in degrees and minutes for the interval of its separation. For this declination and all his astronomical data, he is indebted to the nautical almanac. The longitude is determined by chronometers. A chronometer is expected to keep the time of a certain place, as Greenwich or Paris; but as all chronometers are subject to a slight rate of loss or gain, this rate, and the error at starting, are applied at the moment of observation, to obtain the correct Greenwich time. The change of a degree in longitude is equivalent to a change of four minutes in time; the business of a navigator then is simply to compare his own time with the standard time, or the time at Greenwich; he obtains his own time through an observation of the sun when its altitude is changing rapidly. In the case of the

determination of the longitude by the lunar method, the clock showing the Greenwich time is in the sky. Such observations are detached and disconnected. The navigator, if set down suddenly in the middle of the ocean, could determine his position as well as if he had proceeded there gradually, and known it from day to day.—We have selected single and plain cases only; but navigation, regarded as an art, is a copious and complex system of rules and practices, involving the use of numerous tables. Bowditch's "American Navigator" is a large octavo of nearly 800 pages, containing over 50 tables. Raper's "British Standard Navigator" (edition of 1849), approved by the admiralty, numbers 900 pages and 74 tables. Navigation, regarded as a science, requires at the very least a knowledge of spherical trigonometry and algebra in the mathematics, and of the apparent motions and phenomena of the principal heavenly bodies in astronomy. In addition to the above named authorities, see Peirce's "Plane and Spherical Trigonometry;" Chauvenet's "Trigonometry" and "Manual of Astronomy;" Francœur's *Astronomie pratique*; Boitard and Ansard-Deusy's *Navigations pratique*; Churchill's "Collection," introductory discourse; Dr. Wilson's "Dissertation," in Robertson's "Elements;" and Humboldt's "Cosmos." (See SHIP.)

NAVIGATION LAWS, the name usually given to those enactments by which commercial states have endeavored to regulate the navigation which left or visited their ports, seeking always to favor and promote the commerce of the state enacting them. Such laws have existed in some form among all the maritime states of Europe for many centuries. The first systematic effort of this kind was probably that of Spain, about three centuries ago, to preserve the exclusive possession of her very profitable commerce with her American colonies. In England, so far back as 1379, in the reign of Richard II., a statute was passed prohibiting the king's subjects from importing or exporting merchandise except in English ships. After this time sundry enactments were passed for a similar purpose. But the navigation laws of England, so called, properly began in Cromwell's time. Then the long pending conflict between Holland and England for the supremacy of the seas came to a crisis. The contest continued after the restoration of Charles II. But the fatal blow was given to Holland, and the superiority of England made certain, not so much by her naval victories as by the navigation laws, which, originating in the sagacity of Cromwell, and receiving then the form they have preserved until recent times, secured to England, first, the building of all her ships and their navigation by English seamen; next, the absolute monopoly of her colonial commerce; and finally, her full share of the general carrying trade of the world. For these purposes it was provided that no ship should be deemed a British ship that was not wholly built within

the dominions of Great Britain, and wholly owned by British subjects, and navigated by a British commander and a crew of which at least three fourths were British subjects; next, that only British ships should carry any merchandise from any port of the British empire to any other; and thirdly, that no goods which were the growth, product, or manufacture of Asia, Africa, or America, should be imported into any of the ports of Great Britain except in British ships, or in ships of the countries of which the goods were the production. The rigorous execution of these laws, and the consistent adherence to these principles, are supposed by many to have done more than any other one cause in giving to Great Britain her enormous commerce. In order to ascertain what were British ships, and secure the execution of these laws, an admirable system of registry was adopted and remained in force in England during almost two centuries, with no substantial change. But in 1849 the principle of free trade was permitted to break down this monopoly to some extent. By the act of that year and the subsequent amendments it is enacted, first, that ships which are not of British build may become British ships by registry, if wholly owned by British subjects; and next, that any ship may bring to the United Kingdom any merchandise, excepting, however, that the king or queen, by order in council, may interpose such changes, restrictions, or prohibitions upon ships of any country as will put the ships of that country when in British ports on the same footing on which British ships stand in the ports of that country. —This subject was one of the earliest to which the American congress, under the present constitution, turned its attention; and in the winter of 1792-'3 acts were passed which were substantially the same as the English acts then in force, but, so far as they differ, may be considered as more rigorous. These statutes are still in force, having never been materially altered. The maritime nations of continental Europe have their own systems of navigation laws, but these are not in any case quite so stringent as those of England and the United States. During the years which immediately followed the adoption of the federal constitution, England and France being constantly at war, the United States had almost the whole carrying trade of the world; and its vast profits laid the foundation of the wealth of the country, and built up its commercial marine with a rapidity unexampled in the history of the world.

NAVIGATORS' ISLANDS. See SAMOAN ISLANDS.

NAVY, a collective term for the vessels of war belonging to a nation. The sea-going vessels of Phœnicia and Carthage, of Greece and Rome, were flat-bottomed barges or galleys, unable to live in a gale; sea room in a squall was destruction to them; they crept along the coasts, casting anchor at night in some cove or creek. (See GALLEY.) To cross over from Greece to

Italy, or from Africa to Sicily, was a dangerous operation. The ships were provided with but

Prow of a Galley.

little canvas, and oars were relied upon to propel them sluggishly. The implements for offensive warfare were equally inefficient. Bows and arrows, javelins, clumsy ballistas and catapults, were the only arms that could be used at a distance. No serious harm could be done to an enemy at sea until the two fighting ships came into actual contact. Thus, there were but two modes of naval fighting possible: to manœuvre so that the sharp, strong, iron-pointed prow of your own ship should be driven with full force against the enemy's broadside in order to run him down; or else to run on broadside to broadside, fasten the two ships together, and board the enemy at once. After the first Punic

minion soon put an end to the possibility of further naval contests in the Mediterranean.

—In the naval encounters between the Romans and Gauls described by Cæsar, the former used galleys and the latter merely sail vessels, from which fact it would seem that in the seas about Great Britain sail vessels only were used at that time. The invasion of England by the Anglo-Saxons was made in sail vessels. In the time of Alfred galleys were introduced, the effect of which was to diminish the length and boldness of voyages, for the galleys could not venture out to sea, although they made excellent coast guards. After the Norman conquest sail vessels came more into use, and voyages again became bolder. But the real birthplace of our modern navies is the German ocean. About the time when the great mass of the Teutonic tribes of central Europe rose to trample down the decaying

Norman Galley.

Roman empire and to regenerate western Europe, the Frisians, Saxons, Angles, Danes, and Northmen began to take to the sea. Their

vessels were firm, stout sea boats, with a prominent keel and sharp lines, relying mostly on sails alone, and not afraid to face a gale in the middle of that rough northern sea. It was with this class of vessels that the Northmen undertook their roving expeditions, extending to Constantinople on the one side and America on the other. The vessels in which the Northmen made their excursions were probably of no very large size, perhaps not exceeding 100 tons in any case, and car-

Roman Galley.

war, which destroyed the naval superiority of the Carthaginians, there is not a single naval engagement in ancient history offering the slightest professional interest, and Roman do-

rying one or at the outside two masts, fore-and-aft rigged. For a long time both ship building and navigation appear to have remained stationary; during the whole of the

middle ages vessels were small, and the bold spirit of the Northmen and the Frisians had passed away; whatever improvements were made were owing to Italians and Portuguese,

—The foundation of the British navy was laid by Henry VII., who built the first ship, called "The Great Harry." His successor formed a regular standing fleet, the property of the state,

Henry Grace de Dieu, from an old woodcut.

who now became the boldest sailors. The Portuguese discovered the route by sea to India; two Italians in foreign service, Columbus and Cabot, were the first since the times of Leif the Northman to cross the Atlantic. Long sea voyages now became a necessity, and they required large ships; at the same time the necessity of arming vessels of war, and even merchantmen, with heavy artillery, equally tended to increase size and tonnage. The same causes which had produced standing armies on land, now produced standing navies afloat; and it is from this time only that we can properly speak of navies. The era of colonial enterprise which now opened for all seafaring nations, also saw the formation of large fleets of war to protect the newly formed colonies and their trade; and a period followed richer in naval struggles and more fruitful to the development of naval armaments than any that preceded it.

the largest ship of which was called the Henry Grace de Dieu. This vessel, the largest ever built up to that time, carried 80 guns, partly on two regular flush gun decks, partly on additional platforms both forward and astern. She was provided with four masts; her tonnage is variously stated at from 1,000 to 1,500. The whole of the British fleet at the death of Henry VIII. consisted of about 50 sail, with an aggregate tonnage of 12,000, and manned by 8,000 sailors and marines. In 1578 it comprised 24 ships, of 10,395 tons, 954 guns, and 6,570 men. The Triumph, of 1,000 tons and 100 guns, was the largest vessel; next to her ranked the Elizabeth and the White Bear, each of 900 tons and 80 guns. The large ships of the period were clumsy contrivances, deep-waisted, that is to say, provided with towering forecastles and poops, which rendered them exceedingly top-heavy. The Mary Rose was sunk off Sheerness in 1588 while tacking, her lower ports being only 16 inches above the water. The first English three-decker was the Sovereign of the Seas, afterward called the Royal Sovereign, built in 1637. She bore the character of the best man-of-war in the world until 1696, when she was accidental-

The Sovereign of the Seas.

ly burned at Chatham. She is the first vessel of whose armament we get something like an accurate account. She had three flush decks, a forecastle, a half deck, a quarter deck, and a

round house; on her lower deck she carried 30 guns, 42- and 32-pounders; 30 on her middle deck, 18- and 9-pounders; on her upper deck 26 lighter guns, probably 6- and 3-pounders. Besides these, she carried 20 chase guns and 26 guns on her forecastle and half deck. But on her regular home establishment this armament was reduced to 100 guns, the full complement being evidently too much for her. As to the smaller vessels, our information is very scanty. In 1651 the navy was classed in six rates; but besides them there continued to exist numerous classes of unrated ships, such as shallops, hulks, and later bombs, sloops, fire ships, and yachts. In 1677 we find a list of the whole English navy; according to which, the largest first rate three-decker carried 26 42-pdrs., 28 24-pdrs., 28 9-pdrs., 14 6-pdrs., and 4 3-pdrs.; and the smallest two-decker (fifth rate) carried 18 18-pdrs., 8 6-pdrs., and 4 4-pdrs., or 30 guns in all. The whole fleet consisted of 129 vessels. In 1714 we find 198 vessels; in 1727, 178; and in 1744, 128. Afterward, as the number of vessels increases, their size also gets larger, and the heaviness of the armament is augmented with the tonnage. The first English ship answering to our modern frigate was built by Sir Robert Dudley, as early as the end of the 16th century; but it was not till fully 80 years later that this class of ships, first used by the southern European nations, was generally adopted in the British navy. The particular fast-sailing qualities of frigates were little understood for some time in England. British ships were generally over-gunned, so that their lower ports were but 3 ft. from the water's edge, and could not be opened in a rough sea, and the sailing capacities of the vessels were also greatly impaired. Both the Spaniards and the French allowed more tonnage in proportion to the number of guns; the consequence was that their ships could carry heavier calibre and more stores, had more buoyancy, and were better sailers. The English frigates of the first half of the 18th century carried as many as 44 guns, of 9, 12, and a few of 18 lbs. calibre, with a tonnage of about 710. By 1780 frigates of 38 guns (mostly 18-pdrs.) and of 946 tons were built. The French frigates of the same epoch, with a similar armament, averaged 100 tons more. About the same time (the middle of the 18th century) the smaller men-of-war were more accurately classed in the modern way as corvettes, brigs, brigantines, and schooners. In 1779 a piece of ordnance was invented (probably by the British Gen. Melville) which changed to a great extent the armaments of most navies. It was a very short gun, with a large calibre, approaching in its shape a howitzer, but intended to throw solid shot, with small charges, at short ranges. These guns were first manufactured by the Carron iron company, in Scotland, and were hence called carronades. The shot from this gun, useless at long ranges, had fearful effects upon timber at close quarters; from its

reduced velocity (by the reduced charge), it made a larger hole, shattered the timber far more, and made numerous and more dangerous splinters. The comparative lightness of the guns, too, made it easy to find room for a few of them on the quarter deck and forecastle of vessels; and as early as 1781 there were 429 ships in the British navy provided with from six to ten carronades over and above their regular complement of guns. In reading the accounts of naval engagements during the French and American wars, it should be borne in mind that the British never include the carronades in the number of guns given as a ship's complement; so that, for instance, a British frigate, stated to be a 36-gun frigate, may in reality have carried 42 or more guns, including the carronades. The superior weight of metal which the carronades gave to the British broadsides, helped to decide many an action fought at close quarters during the war of the French revolution. But after all, carronades were merely a make-shift to increase the strength of the comparatively small-sized men-of-war of a century ago. As soon as the size of the ships was increased for each rating, they were again cast aside, and are now superseded by other arms. At that period, in the construction of men-of-war, the French and Spaniards were decidedly ahead of the English. Their ships were larger and designed with far better lines than the British; their frigates especially were superior both in size and sailing qualities; and for many years the English frigates were copied from the French frigate Hebe, captured in 1782. In the same proportion as the vessels were lengthened, the high towering erections at the bow and stern, the forecastles, quarter decks, and poops, were reduced in height, the sailing qualities of the ships being increased thereby; so that gradually the comparatively elegant and swift-sailing lines of the present men-of-war came to be adopted. Instead of increasing the number of guns to these larger ships, the calibre was increased, and so were the weight and length of each gun, in order to admit of the use of full charges, and to secure the greatest point-blank range, so as to allow the fire to be opened at long distances. The small calibres below 24 lbs. disappeared from the larger vessels, and the remaining calibres were simplified, so as to have no more than two calibres, or at the outside three, on board of any one vessel. In ships of the line, the lower deck, being the strongest, was armed with guns of the same calibre as the upper decks, but of greater length and weight, in order to have at least one tier of guns available for the greatest possible range.—About 1820 the French Gen. Paixhans made an invention which has been of great importance in naval armaments. He constructed a gun of large calibre provided with a chamber at the breech for the insertion of the powder, and began to fire hollow shot, at low elevations, from these "shell guns" (*canons obusiers*). Hither-

to hollow shot had been fired against ships from howitzers in shore batteries only; though in Germany the practice of firing shell horizontally from short 24-pdr. and even 12-pdr. guns had been long in use against fortifications. The destructive effects of shell against the wooden sides of vessels were well known to Napoleon, who at Boulogne armed most of his gunboats for the expedition to England with howitzers, and laid it down as a rule that ships must be attacked with projectiles which will burst after hitting. Now, Paixhans's shell guns gave the means of arming ships with cannon which, by throwing their shells as nearly as possible horizontally, could be used at sea, ship against ship, with nearly the same probability of hitting as the old round-shot guns. The new gun was soon introduced into all navies, and, after undergoing various improvements, for some time constituted an essential portion of the armament of all large men-of-war.—The first attempts were made to apply steam to the propulsion of ships of war shortly after it had been applied by Fulton to that of commercial vessels. The progress from the river steamer to the coasting steamer, and gradually to the ocean steamer, was slow; in the same ratio was the progress of war steamers retarded. As long as paddle boats were the only steamers in existence, this was justifiable. The paddles and part of the engine were exposed to the enemy's shot, and could be disabled by a single lucky hit; they took up the best portion of the broadside room of the vessel; and the weight of engine, paddles, and coal so much reduced the capacity of the ship, that a heavy armament of numerous long guns was entirely out of the question. A paddle steamer, therefore, could never be a ship of the line; but its superior speed might permit it to compete with frigates, which are expected to hover on the flanks of an enemy, to collect the fruits of a victory, or to cover a retreat. Now a frigate has just the size and armament which enable it to go fearlessly on any independent roving errand, while its superior sailing qualities enable it to withdraw in time from an unequal contest. The sailing qualities of any frigate were far outstripped by the steamer; but without a good armament the steamer could not fulfil its mission. Regular broadside fighting was out of the question; the number of guns must, for want of space, be always inferior to that of a sailing frigate. The diminished number of guns on board a steam frigate was counterbalanced by their weight of metal and calibre. Originally these guns were intended to throw shells only, but now rifled guns have nearly superseded smooth-bores, and in a short time there will be no smooth-bores afloat in the navies of the great powers. Moreover, the reduced number of guns admits of traversing platforms and railways being laid down on the deck, by means of which all or most of the guns can be brought to bear in almost any direction; a provision by which the strength of a steam frigate for an attack is

nearly doubled, and a 20-gun steam frigate can bring at least as many guns into action as could a 40-gun sailing frigate with but 18 working guns for each single broadside. Thus the large modern steam frigate is a most formidable ship; the superior calibre and range of her guns, added to her velocity, enable her to cripple an opponent at a distance where no effective return of fire would have been possible to the sailing vessel; while the weight of her metal comes in with crushing power when it is to her advantage finally to force the fighting. For smaller vessels, corvettes, advice boats, and other light craft, not counting in a naval battle, but very useful throughout a campaign, steam was at once found of great advantage, and there were many such paddle boats constructed in most navies. It was the same with transport ships. Where landings were intended, steamers not only reduced the length of passage to a minimum, but permitted one to calculate to a moral certainty the time of arrival at any given place. The transport of bodies of troops was now made a matter of great simplicity, especially as every naval country had a large fleet of commercial steamers to fall back upon for transport vessels in case of necessity. It was on these considerations that the prince de Joinville, in his well known pamphlet, ventured to maintain that steam had altered the condition of naval warfare to such an extent as to render an invasion of England by France no longer an impossibility. Still, so long as the ships used for decisive action, the ships of the line, remained exclusively sailing vessels, the introduction of steam could work but little change in the conditions under which great naval battles were fought. The invention of the screw propeller was destined to supply the means of revolutionizing naval warfare entirely, and to transform all war fleets into steam fleets. It was fully 13 years after the invention of the screw before the first step in this direction was made. Finally in 1849 the French engineer Dupuy-Delôme constructed the first screw line-of-battle ship, the *Napoléon*, of 100 guns and 600 horse power. This ship was not intended to depend upon steam only; unlike the paddles, the screw allowed a ship to retain all the lines and rigging of a sailing vessel, and to be moved at will by steam alone, by sails alone, or by both combined. She could therefore always save her coal for emergencies by having recourse to her sails, and was thus far less dependent upon the proximity of coaling stations than the old paddle-wheel steamer. On this account, and because her steam power was too weak to give her the full speed of a paddle steamer, the *Napoléon* and other vessels of this class were called auxiliary steam vessels; since then, however, ships of war of the largest class have been constructed which have steam power enough to give them all the speed of which the screw propeller is capable. The success of the *Napoléon* soon caused screw

ships of war to be built both in France and England. The Russian war gave a new impulse to this radical change in naval construction; and when it was found that all strong-built ships of war could, without too much difficulty, be fitted with a screw and engines, the transformation of all navies into steam fleets became only a matter of time. No large naval power now thinks of constructing sailing vessels; all ships newly laid down are screw steamers, except the few paddle steamers which for certain purposes are still required.—The Crimean war called into existence two new naval constructions. The first of these is the steam gun boat or mortar boat, originally constructed by the English for the contemplated attack on Cronstadt; it is a small vessel drawing from 4 to 7 ft. of water, and armed with one or two heavy long-range guns or a heavy mortar; the former to be used in shallow and intricate waters generally, the latter in the bombardment from a long distance of fortified naval arsenals. The gun boats, when acting in concert with coast batteries, will strengthen the defence, and will also provide naval warfare with those light skirmishers which were hitherto wanting to it. The second innovation is the iron-sided, shot-proof floating batteries, first constructed by the French, for the attack of coast defences. The navies of the world are at present in an experimental state. For defence of harbors and coasts iron-clad ships are taking the place of wooden unarmed ships, and indeed the French and British and some other European nations have sent to sea iron-clad cruisers. Several American monitors also have been tested at sea, and some contend that they are suitable for cruising; but the success of ironclads has not been so far fully demonstrated. For an account of the history of such vessels, and of rifled naval guns, see IRON-CLAD SHIPS.—The vessels of war of which modern navies are composed are classed in various ratings, from first to sixth rates. The classification before the introduction of steam and iron-clad ships was the following: 1. Ships of the line were the largest men-of-war afloat, destined to form the line of battle in a general action, and to decide the struggle by the weight of metal thrown into the enemy's

ships. They were either three-deckers or two-deckers; that is to say, they had either three or two covered decks armed with guns. These decks were called the lower, middle, and main or upper deck. The upper deck, which was formerly covered in at the quarter deck and

U. S. Screw Ship of War Wabash (first rate).

forecastle only, was afterward covered in by a continuous open deck from stem to stern. This open deck, which was called the quarter deck and forecastle, also carried artillery, mostly carronades; so that in reality a two-decker carried three, and a three-decker four tiers of guns. The heaviest guns were of course placed on the lower deck; and the guns became lighter in proportion as the batteries were more elevated above the water. The calibre being generally the same, lightness was obtained by reducing the weight of the guns, in consequence of which those on the upper decks could only stand reduced charges, which implied that they could be used only at shorter ranges. The only exception to this rule was in the case of chase guns, which were placed at the bow and stern of a ship, and which, even if placed on the forecastle or quarter deck, were still as long and heavy as possible, being required to act at the longest ranges practicable. Thus, the bow and stern guns of English ships of the line were composed either of 8- or 10-inch shell guns, or of 56-pdr. (bore 7·7 in.) or 68-pdr. (bore 8·13 in.) solid-shot guns, one of which was placed on the forecastle on a traversing platform. There were in the English navy generally six stern and five bow guns to a first rate; the remaining armament of such a ship was as follows:

POSITION.	DESCRIPTION.	W'ght.	Length.	No.
		Cwt.	Ft. In.	
Lower deck.....	8-inch shell guns....	65	9 0	4
" ".....	32-pdr. guns.....	56	9 6	28
Middle deck.....	8-inch shell guns....	65	9 0	2
" ".....	32-pdr. guns.....	50	9 0	82
Upper deck.....	" ".....	42	8 0	34
Forecastle and /	" ".....	45	8 6	6
quarter deck }	" carronades	17	4 0	14
Total.....	120

The armament of the smaller ratings of vessels of the line was arranged upon the same principle. For the sake of comparison, we also give that of a French first rate, viz.: lower deck, 32 long 30-lb. guns; middle deck, 4 80-lb. shell guns, and 30 short 30-lb. guns; upper deck, 34 30-lb. shell guns; forecastle and quarter deck, 4 30-lb. shell guns, and 16 30-lb. carronades; in all, 120 guns. The French 80-lb. shell gun has a larger bore than the 8-inch English gun by 0.8 inch; the 30-lb. shell gun and the 30-lb. gun have a slightly larger bore than the English 32-pdr., so that the advantage of weight of metal would lie with the French. The smallest ship of the line carried 72 guns; the largest frigate carried 61. 2. A frigate is a ship with only one covered deck carrying guns, and another open deck above it (forecastle and quarter deck), which is equally

platform at the bow. Frigates being mostly sent on detached service, where they were always likely to become engaged single-handed against hostile frigates sent on the same errand, it was a great point with most naval nations to make them as large and powerful as possible. In no class of vessels is the increase in size so remarkable as in this. The United States, requiring a cheap navy strong enough to enforce respect, were the first to see the great advantage to be drawn from a fleet of large frigates, each of them superior to any frigate which other nations could bring against it. The superiority of the American ship builders in producing swift vessels was also taken advantage of, and the last war against England (1812-'15) showed in many well-contested engagements what formidable antagonists these American frigates were. They were considered models of this class of vessels. The names frigate and corvette or sloop have been retained in the navies of the present day. 3. The next class of men-of-war was called corvettes. They had but one tier of guns, placed on an open deck; but the larger class was provided with a forecastle and quarter deck (not connected however by a continuous deck amidships), where they carried a few guns more. Such corvettes, therefore, almost corresponded to what a frigate was 100 years ago,

before the two elevated extremities of the vessel were connected by a flush deck. These corvettes were strong enough to carry the same calibre of guns as the larger vessels. They also carried three masts, all square-rigged. Corvettes are also called sloops of war. 4. Of smaller vessels, brigs and schooners carried from 20 guns to 6. They had but two masts, square-rigged in brigs, fore-and-aft rigged in schooners. The calibre of their guns was necessarily smaller than that of the larger ships, and did not generally exceed 18- or 24-pdrs., going down as low as 12- and 9-pdrs. Vessels of this small power of offence could not be sent where seri-

U. S. Sailing Frigate Constitution.

provided with guns. The armament, in the English service, was generally of 30 guns (either all shell guns or part shell guns and part long 32-pdrs.) on the gun deck, and 30 short 32-pdrs. on the forecastle and quarter deck, with a heavy pivot gun on a traversing

ous resistance was anticipated. In European waters they have been superseded by small steamers, and they could have been of actual service only on such coasts as those of South America, China, &c., where they had to meet powerless antagonists, and where they mere-

ly served to represent the flag of a powerful naval nation.—During the 17th century the noted naval commanders distinguished themselves as soldiers as well as sailors, and in many instances (notably that of Admiral Blake) it is certain that commanders of fleets and squadrons had no naval experience. The result was, that in ships of war there were two departments, the sailing and the fighting departments, the former in charge of the navigation of the ship, and the latter of its discipline and fighting. This arrangement did not last long, as it was soon seen that a ship more than any other thing should have but one head, responsible for everything. Therefore the commander of a ship of war is now responsible for its navigation as well as for its discipline and the state of its war material, and in fact is the only person on board to whom the higher authority looks for the proper care of the public property and the behavior of the ship in action. The grades of officers are nearly the same in all navies of the present day. Admirals, vice admirals, rear admirals, and commodores in general command fleets and squadrons and navy yards. Captains command large ships, and commanders smaller ones. Lieutenant commanders and lieutenants are the immediate assistants and subordinates of the ship commanders. Masters come next below lieutenants, and are equivalent to second lieutenants; after them come ensigns. Midshipmen are aspirants for the higher grades, and are usually educated at government naval schools before they are sent to sea in cruisers. The preceding are all line officers. Chaplains, paymasters, surgeons, and engineers are attached to all navies, and have rank assimilated to the grades given above, dependent upon length of service. These are staff officers. In some foreign navies each of the three grades of admirals is subdivided into three other grades, making nine in all, designated by the colors of their flags, which are red, white, or blue. Thus there may be an admiral of the white, or of the red, or of the blue, &c. The admiral's ship is recognized by his flag, which is square. In the United States navy its color is blue. Captains and other commanders of ships fly a pennant. Gunners, boatswains, quartermasters, cockswains, carpenters, sailmakers, machinists, armorers, &c., are called warrant or petty officers according to the style of their appointments, and are not in general in the line of promotion. Seamen, ordinary seamen, landsmen, and firemen are the privates, and do the work of navigating the ship, firing the engines and handling the guns. A war ship's company must have in it numerous persons whose duties are exceedingly various. Thus, there are secretaries, clerks, cooks for the officers, cooks for the men, nurses, coopers, tailors, bakers, stewards, musicians, painters, &c., besides the assistants to these functionaries, and servants. A guard of marines is attached to every ship of war, the members of which are armed as

infantry and do sentinel's duty. Their officers have the same grades as those of the army, and are assimilated in rank to those of the line of the navy. Their grades, however, are not dependent upon length of service.—The origin of the navy of the United States may be said to date from Oct. 13, 1775, when congress authorized the equipment of two cruisers mounting respectively 10 and 14 guns. Before the end of that year, 15 more vessels, of from 20 to 36 guns, were authorized. These vessels were built in the colonies of New England, and in New York, Pennsylvania, and Maryland. On Dec. 22, 1775, congress appointed a corps of naval officers, of whom Esek Hopkins was commander-in-chief, and John Paul Jones was a lieutenant. The affairs of the navy were at this time intrusted to the management of a "marine committee." In October, 1776, the navy consisted of 26 vessels, mounting 536 guns, and its services throughout the revolutionary war were most important. In 1778 several vessels of considerable force were built or purchased for the navy; among these was the celebrated *Alliance*, a frigate of 32 guns. The first vessel of war taken by an American cruiser in battle was the *Edward*, which was captured by the *Lexington*, Capt. John Barry, on April 17, 1777. On March 27, 1794, congress authorized the construction of six frigates, and it was fortunately decided that three of them should be of a very heavy class; the *Constitution* was one of these ships. This step laid the foundation of the present navy, the vessels of the revolution having been disposed of at the end of that contest, in 1783. Large whaleboats were fitted out by both sides during the war of the revolution, which were effective gunboats. They were about 40 ft. long, propelled by oars and sails, and carried two guns and a supply of small arms. Their crew numbered between 40 and 50 men. They went far out to sea, and severe fights took place between the boats of the rebels and loyalists. In 1798 the navy department was formally created, and Benjamin Stoddart appointed the first secretary. At this time, urged by the depredations of France upon our commerce, and warned by the conduct of the Barbary powers, congress authorized a considerable increase of the navy, which the president was empowered to use for defence against the French. In the quasi war with France which resulted, our naval successes were marked. Upon the accession to office of Mr. Jefferson in 1801, the navy was reduced. In the same year war was declared by Tripoli against the United States, and continued till 1805. The naval achievements of these four years gave a high character to the American service. In 1803 the "gunboat system" was inaugurated. In 1806 and 1807 the number of gunboats was rapidly increased, congress having authorized the construction of 257 of these vessels; but they were afterward found to be expensive and inefficient, and the system was soon abandoned.

During the war of 1812 the navy obtained a vast increase of reputation. The superior force of the frigates of 1794 was evinced in their almost uniform success in action with an enemy hitherto deemed invincible on the ocean. The policy of maintaining an efficient navy was now considered settled; and although, compared with the navies of other nations, that of the United States is very small, the aim has always been to keep pace with the improvements of the day, and to have none but the most efficient ships of their class in the service. The navy of the United States still possesses wooden sailing vessels, but it is not probable that any of them will ever go to sea again as cruisers, or in any other capacity, except as practice ships or on some peaceful service. The sailing navy may be considered as out of existence. In the navy of the United States the wooden war steamers were on Jan. 1, 1874, as follows:

RANK.	Num-ber.	AVERAGE.	
		Guns.	Tonnage.
First rates.....	5	45	3,000
Second rates.....	31	20	2,200
Third rates.....	24	8	800
Fourth rates.....	5*	4	400

The wooden sailing vessels at the same date were as follows:

RANK.	Num-ber.	AVERAGE.	
		Guns.	Tonnage.
Second rates.....	5	15	2,600
Third rates.....	10	20	1,500
Fourth rates.....	8	10	800
	4	2	600

There were also 48 iron-clad vessels and 26 tugs and other small vessels. Admiral Porter in his annual report, Nov. 6, 1874, says that though the ironclads fulfilled in the late civil war the specific purpose for which they were built, none of them can now compete with recently constructed foreign monitors; 20 of them have been condemned, and only 17 are serviceable. Of the wooden ships only 31 can properly be called vessels of war, and a thorough rebuilding of the navy is recommended, especially of monitors for coast defence. The personnel of the navy, and its annual pay when at sea, were on Jan. 1, 1874, as follows: 1 admiral, \$13,000; 1 vice admiral, \$9,000; 11 rear admirals, \$6,000; 25 commodores, \$5,000; 50 captains, \$4,500; 90 commanders, \$3,500; 132 lieutenant commanders, \$2,800 to \$3,000; 236 lieutenants, \$2,400 to \$2,600; 100 masters, \$1,800 to \$2,000; 35 ensigns, \$1,200 to \$1,400; 103 midshipmen, \$1,000; and 235 cadet midshipmen at the naval school, \$500. There were 150 medical officers of the various grades, 131 paymasters, 211 engineers, 42 cadet engineers, 22 chaplains, 12 professors of mathematics, 17 naval constructors and assistants, and 7 civil engineers. The warrant officers

* Three iron vessels.

were 58 boatswains, 64 gunners, 46 carpenters, 40 sailmakers, and 58 masters' mates. On the retired list there were 280 commissioned and warrant officers. In the marine corps there were 92 officers of all grades from brigadier general to second lieutenant on the active list, and 10 commissioned officers on the retired list. The navy is governed under the president by the secretary of the navy. In his department are eight bureaus which have charge of all the details of administration of the service. Each of these has for its head an officer of the navy of high rank, who serves for four years.

NAXOS, or **Naxia**, an island of Greece, and the largest of the Cyclades, in the Archipelago 5 m. E. of Paros; length about 20 m., greatest breadth 14 m.; area, about 150 sq. m.; pop. in 1870, 11,508; of the eparchy of Naxos, which includes Paros and several smaller islands, 20,582, all members of the Greek church, except about 400 Roman Catholics. The surface is diversified and picturesque; the plains and valleys are remarkable for their fertility. In the centre of the island is the mountain anciently called Drius, now Zia or Dia, 3,300 ft. high, from which 22 islands and the Asiatic continent are visible. The vine, olives, oranges, iron, marble, &c., are produced, and cheese, honey, and wax are among the principal exports. The wine of Naxos, called Bacchus wine, was celebrated. Naxos formerly furnished the bulk of the emery used in trade, the annual production amounting to 2,000 tons. The island contains about 40 villages. Naxos, the capital, is on the W. coast; pop. about 5,000. The streets are narrow, and the former ducal palace is in ruins, but the white houses present a cheerful appearance. It is the seat of a Greek bishop and a Roman Catholic archbishop, and has ten Greek and four Roman Catholic churches, a Lazarist, a Capuchin, and an Ursuline convent, and a custom house.—This island in antiquity was sometimes called Strongyle from its circular form, sometimes Dionysias from the prevalence there of the worship of Dionysus (Bacchus), and frequently Dia in honor of Zeus. It was inhabited in early times chiefly by Ionians from Attica. It was conquered by Pisistratus, and in 490 B. C. by the Persians. After the battle of Salamis it regained its independence, but nine years later became a dependency of Athens, and after many vicissitudes of the Roman and then the Byzantine empire. In A. D. 1207 it became the seat of a duchy, comprising several other islands, established by the Venetian Marco Sanudo. In 1566 the island was taken by the Turks, and under Selim II. was ruled by a Jew, Joseph Nasi (the Prince).

NAYLOR, James, an English religious enthusiast, born at Ardsley, Yorkshire, about 1616, died in Huntingdonshire in 1660. In 1642 he took up arms for the parliament. After the overthrow of the royalist party he became a follower of George Fox and an itinerant preacher. He fancied that he was inspired,

that he was set as a sign of Christ's coming, and that the spirit of the Saviour dwelt in him. For these opinions the parliament in 1656 condemned him to stand with his head in the pillory for two hours, be whipped at the cart's tail from Palace yard to the old exchange, have his tongue bored with a red-hot iron, and his forehead branded with the letter B, as the stigma of a blasphemer; and he was afterward imprisoned for nearly three years. After his liberation he hastened homeward, but died on the way. Naylor's theological essays, epistles, &c., were published in 1716, and "Memoirs of the Life, Ministry, Trial, and Sufferings of James Naylor" appeared in 1719.

NAZAREANS. See CHRISTIANS OF ST. JOHN.

NAZARENE, a term of contempt applied to Christ and his first disciples, from Nazareth, the place of his residence, a poor town in the despised region of Galilee. There was a sect

of heretics called Nazarenes in the 2d century, who insisted on the necessity of combining the Mosaic ceremonies with the religion of Christ. In Hungary, in 1857, arose a new sect which in the ten succeeding years made so many converts as to attract the attention of the government. Calling themselves Nazarenes, without disputing the divine origin of the Old Testament, they claim to derive their creed exclusively from the New Testament. They have no ordained clergy, and any man may explain the Scriptures. They practise baptism by immersion and for adults only. The funerals are simple, and the dead are not mourned for. Marriage is regarded as a purely civil institution, and Sunday is not considered sacred.

NAZARETH (now *En-Nazireh*), a town of Palestine, 20 m. S. E. of Acre, and 65 m. N. of Jerusalem; pop. about 4,000, about one fourth of whom are of the Greek church, the

Nazareth.

rest being Moslems, Greek Catholics, Latins, and Maronites. It is beautifully situated in a valley surrounded on all sides by hills. The houses are mostly of stone, well built, and flat-roofed. The population has a more prosperous appearance than in any other part of the country, and the women of Nazareth are famous for their beauty. At the periodical feasts there is an immense influx of pilgrims. The principal edifices are the Latin convent, the finest in Palestine, the Latin church of the Annunciation, the Casa Nuova, or Christian caravansary, a Mohammedan mosque, and a khan. It is celebrated as the residence of Christ during the first 30 years of his life.

NAZARETH, a village of Northampton co., Pa., 60 m. N. by W. of Philadelphia and 9 m. N. W. of Easton; pop. in 1870, 949. It was

founded by George Whitefield in 1740, who, before completing an edifice in course of erection intended as a school for the instruction of African children, sold it to Count Zinzendorf, who finished it for the use of the Moravians. The village contains two large churches and a Moravian academy for boys.

NAZARITE (Heb. *nazir*), under the Levitical law, a person who for a certain period was bound by a vow to keep his hair unshorn, and to abstain from wine and every other kind of strong drink and from contact with the dead. Samson was a Nazarite.

NEAL, Daniel, an English historian, born in London, Dec. 14, 1678, died in Bath, April 4, 1743. He spent three years at the universities of Utrecht and Leyden, and became assistant pastor of an Independent congregation in Lon-

don. His principal works are "History of New England" (2 vols., London, 1720), and "History of the Puritans" (4 vols., 1732-'8; edited by Toulmin, 6 vols., 1793, and 3 vols., 1837).

NEAL, Alice Bradley. See HAVEN.

NEAL, David. See supplement.

NEAL, John, an American author, born in Falmouth (now Portland), Me., Aug. 25, 1793, died there, June 20, 1876. His parents were Friends, with which society he also was connected until the age of 25, when, principally for his inability to "live peaceably with all men," he received his dismissal. About the age of 12 he was employed in Portland as a shop boy; a few years later he taught drawing and penmanship in the principal towns of Maine; in 1814-'15 he was a dry-goods retailer and jobber in Boston and New York, and afterward established himself in Baltimore as a wholesale dealer in partnership with John Pierpont. In 1816 they failed, and Neal began the study of the law. He read through a legal course intended to embrace a period of several years in a twelvemonth, besides attending lectures and studying several languages. In 1816 he produced a review of the works of Byron, written it is said in four days, which appeared from month to month until completed in the "Portico," a Baltimore magazine. In 1817 he published his first novel, "Keep Cool" (2 vols., Baltimore), originally called "Judge Not," followed the next year by "The Battle of Niagara, Goldau, and other Poems." In 1819 appeared "Otho, or the Bastard," a five-act tragedy; and about the same time he assisted Dr. Watkins in writing the "History of the American Revolution by Paul Allen." Admitted to the Maryland bar in 1819, he entered upon practice, but continued his literary labors. Besides preparing an index for "Niles's Register," then amounting to upward of 50 volumes, he published in 1823 the novels "Seventy-Six, a Romance of the Revolution," "Logan," "Randolph," and "Errata." They were severally written, according to his own account, in periods of from 27 to 39 days. He went to England in January, 1824, and wrote articles for various periodicals, including "Sketches of the five American Presidents and the five Candidates for the Presidency" for "Blackwood's Magazine." His literary efforts attracted the notice of Jeremy Bentham, who invited him to take up his residence in his house, of which he remained an inmate during a considerable portion of his stay in England. In 1827 he returned to America, and settled in Portland, where he employed himself in practising law, writing, and lecturing; "and that no superfluous energy might run to waste, established gymnasiums and gave lessons to large classes in sparring and fencing." This life he continued till 1850, when he gave up his profession. He also published "Brother Jonathan" (3 vols., London and Edinburgh, 1825); "Rachel Dyer" (Portland, 1828); "Bentham's Morals and Legislation" (Boston,

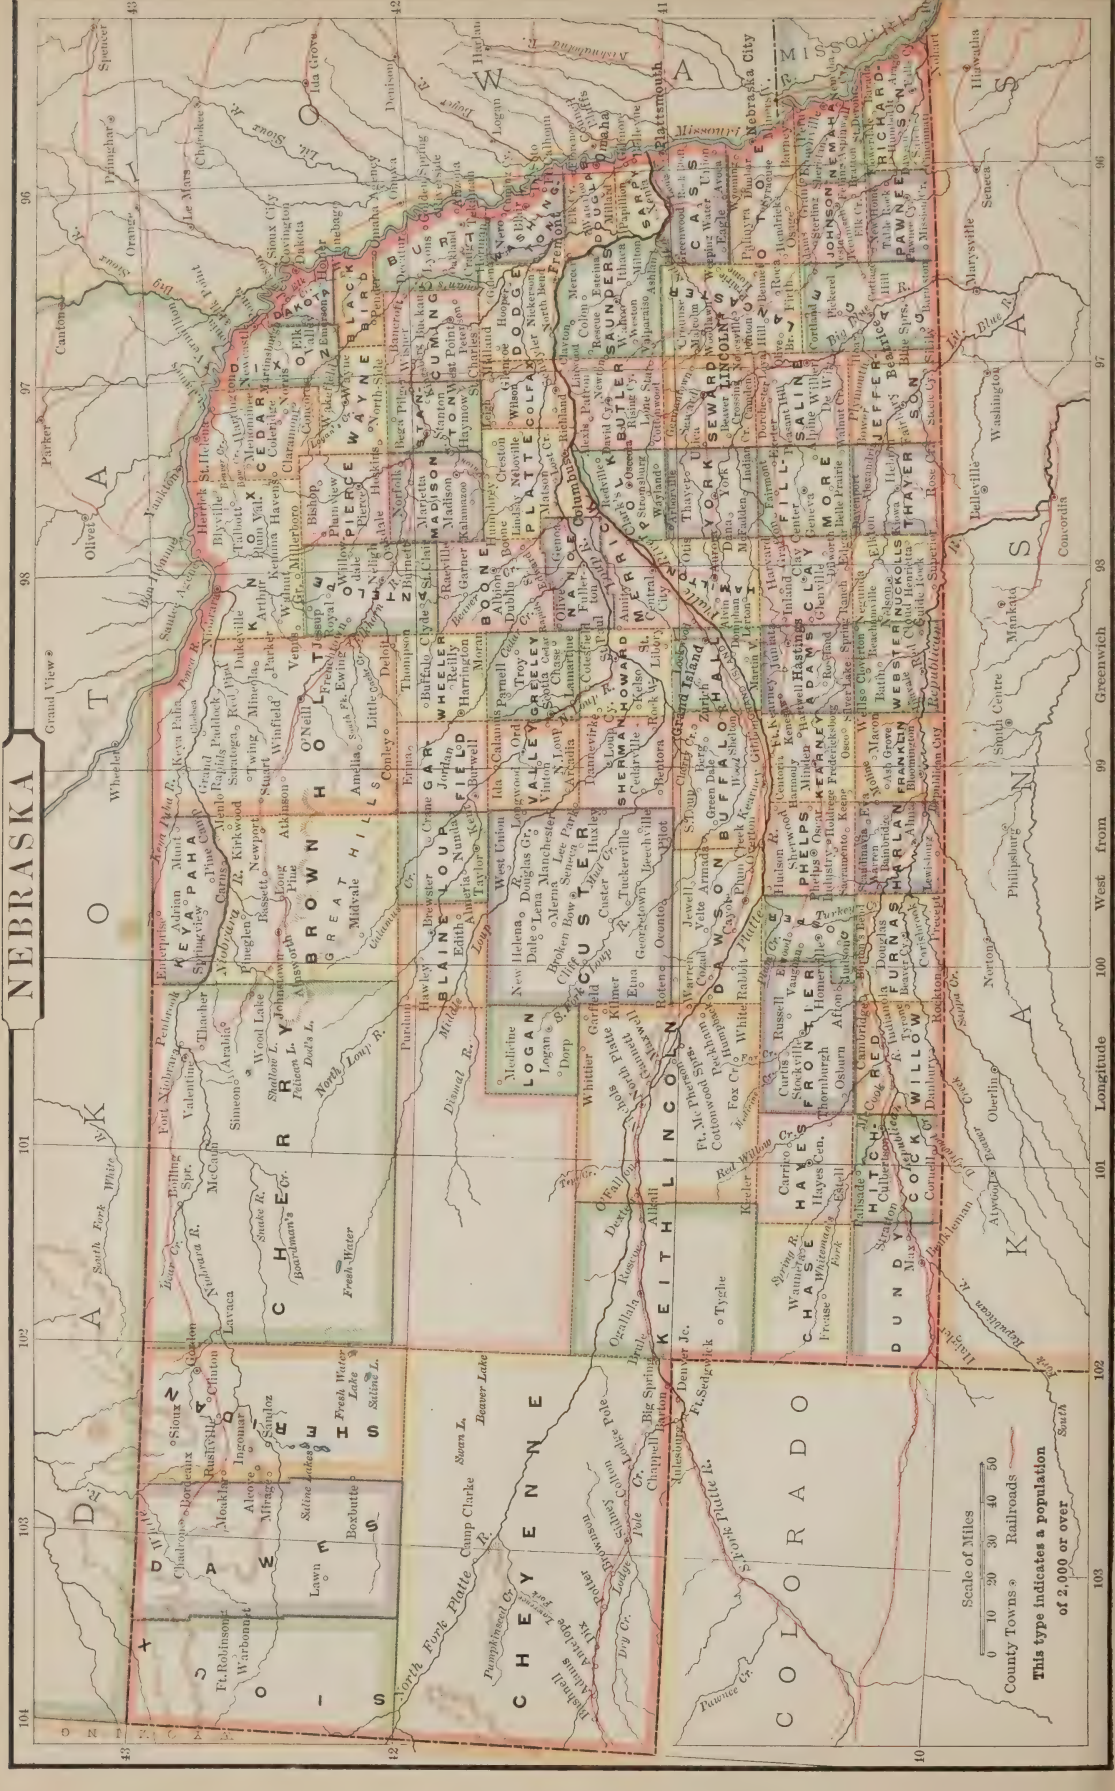

1830); "Authorship, a Tale" (1833); "The Down Easters" (2 vols., New York, 1833); "One Word More" (1854), essays of a religious character; "True Womanhood, a Tale" (Boston, 1859); "Wandering Recollections of a Somewhat Busy Life" (1869); and "Portland Illustrated" (1874).

NEAL, Joseph Clay, an American humorist, born in Greenland, N. H., Feb. 3, 1807, died in Philadelphia, July 3, 1848. He resided several years in Pottsville, Pa., but in 1831 became the editor of the "Pennsylvanian," a newspaper of Philadelphia. He went abroad in 1841, returned in 1842, and in 1844 established "Neal's Saturday Gazette," a weekly literary journal. In 1837 he published "Charcoal Sketches, or Scenes in a Metropolis;" in 1844 "Peter Ploddy and other Oddities;" and subsequently a new series of "Charcoal Sketches." In 1846 he married Emily Bradley, who afterward acquired distinction as an author under the pseudonym of "Cousin Alice." (See HAVEN, ALICE BRADLEY.)

NEALE, John Mason, an English clergyman, born in London, Jan. 24, 1818, died at East Grinstead, Sussex, Aug. 6, 1866. He graduated in 1840 at Trinity college, Cambridge, where he had taken the members' prize in 1838, and where he obtained the Seatonian prize for a sacred poem nine times between 1845 and 1861. He took orders in 1842, and became incumbent of Crawley in Sussex. In May, 1846, he was appointed warden of Sackville college, East Grinstead. He was allied to the high church party, and in 1855 founded the sisterhood of St. Margaret. He was the author of about 70 books, of which the most important are the following: "History of the Holy Eastern Church, the Patriarchate of Alexandria" (2 vols., 1850-'51); *Sequentiæ ex Missalibus Germanicis* (1852); "Mediæval Preachers and Mediæval Preaching" (1857); "History of the so-called Jansenist Church of Holland" (1858); "Commentary on the Psalms" (1860); *Hymni Ecclesiæ* (new ed., 1865); "Essays on Liturgiology and Church History" (1863); "The Liturgies, in Greek, of St. Mark, St. James, St. Clement, St. Chrysostom, and St. Basil" (1868); "Hymns of the Eastern Church," with notes and introduction (1871).

NEANDER, Johann August Wilhelm, a German church historian, born in Göttingen, Jan. 17, 1789, died in Berlin, July 14, 1850. His original name was David Mendel. His father was a Jewish peddler; his mother was an intelligent and pious Jewess, and soon after the birth of David, her youngest child, removed with him to Hamburg. He was reared in poverty, but by the assistance of friends was enabled to satisfy his desire for a liberal education in the Johanneum of Hamburg. He soon attracted the notice of his teachers by his talent and industry, as well as by the oddity of his appearance and the awkwardness of his manner. He looked like a simpleton, and was the source of much amusement to his fellow stu-

NEBRASKA

dents; but he took no notice of it, and lived in a world of abstraction. He associated especially with Varnhagen von Ense, Chamisso the poet, Wilhelm Neumann, Noodt, and Sieveking, and formed with them a literary association under the name of the "Polar Star." Schleiermacher's "Discourses on Religion" made a powerful impression on Neander; and in 1806 he publicly renounced Judaism and was baptized, adopting the name of Johann August Wilhelm Neander, from his teacher Johann Gurlitt and his friends August Varnhagen and Wilhelm Neumann (in Greek νέος ἀνὴρ, new man). He studied theology at Halle and Göttingen, and returned to Hamburg to enter the ministry. In 1811 he began to deliver theological lectures in Heidelberg, and in 1812 was called to the newly founded university of Berlin as professor of church history. He soon became one of the theological celebrities of the metropolis, and continued to labor there as teacher and writer with very little interruption till his death. His last words, addressed to his sister, who attended to his wants (for he never married), were: "I am weary, let us go home!" In his outward appearance he was of middle size and slender frame. He had strongly marked Jewish features, bushy eyebrows, and weak sight, being at last blind. He dressed carelessly, with jack-boots and a shabby hat. In the lecture room his eccentricities were prominent, but his earnestness and enthusiasm commanded attention. He lectured on nearly all branches of exegetical and systematic theology, but especially on history. As an author he won the honorable title of "father of church history." His reputation mainly rests on the "General History of the Christian Religion and Church," from the close of the apostolic age to the council of Basel in 1431 (6 vols. in 11 parts, 1825-'52; 3d ed., 1851-'6; translated into English, in part by Rose, and in full by Prof. Torrey, and several times reprinted in Boston, Edinburgh, and London). He also wrote on Julian the Apostate (1812), St. Bernard (1813), Gnosticism (1818), St. Chrysostom (2 vols., 1821-'2), and Tertullian (1825); a "History of the Apostolic Age" (2 vols., 1832-'3); a "Life of Jesus Christ," in refutation of Strauss (1837); and on "Christian Life" (3 vols., 1840). To these must be added a few popular practical commentaries on the Epistle to the Philippians, on the Epistle of St. James, and the first Epistle of St. John (translated by Mrs. H. C. Conant). His minor essays were collected by Jacobi (Berlin, 1851). After his death were published his lectures on the "History of Christian Doctrine" (1857), and on the "Epistles to the Corinthians" (1859). A complete collection of his works has appeared (13 vols., Gotha, 1862-'6). His library was purchased for the theological seminary of Rochester, N. Y.

NEAPOLIS. **I.** An ancient town of Campania. See NAPLES. **II.** An ancient town of Palestine. See NABLUS, and SHECHEM.

NEARCHUS, a Greek admiral of the 4th century B. C. He was a native of Crete, was prominent at the court of Macedon during the reign of Philip, and having participated in the intrigues of Alexander against his father, he was banished. On the death of Philip he was recalled, and after the conquest of the maritime provinces of Asia was made governor of Lycia and other regions S. of the Taurus. In 329 he joined Alexander in Bactria with a reinforcement of Greek mercenaries. During the Indian expedition he was intrusted with the command of the fleet, and when the armament arrived down the Indus at the ocean, he offered to conduct the ships to the shores of Persia. He began his voyage Sept. 21, 325, and after encountering numberless dangers reached the mouth of the Anamis, a river of Caramania, emptying at the entrance to the Persian gulf, Dec. 9, five days' journey from which place Alexander was then encamped. Sailing along the N. shore of the Persian gulf to the Pasitigris, Nearchus ascended that stream and arrived at Susa in February, 324. Alexander had already arrived there, and bestowed upon the admiral, besides other marks of favor, a crown of gold and the daughter of the Rhodian Mentor in marriage. After the death of Alexander, Nearchus was restored to the government of his former provinces, which he held as the dependant of Antigonius. The latest mention of him in history is in 314, when Antigonius appointed him to attend his son Demetrius Poliorcetes as a counsellor on his first taking command of an army. Nearchus is said to have written an account of his voyage (*Παράπλους*), the substance of which has been probably preserved in the *Indica* of Arrian.

NEATH (popularly called Castle Nedd), a town of Glamorganshire, S. Wales, on the river Neath, 30 m. N. W. of Cardiff; pop. in 1871, 9,184. It occupies the site of a Roman station (*Nidum*), and contains relics of an old castle and abbey. The town has been much improved within a few years. The port is accessory to that of Swansea, accommodating vessels of 300 tons, but the principal trade is carried on in barges to Briton Ferry, 2 m. below the town. Large iron, copper, and tin works are in the vicinity, and besides these metals coal and other articles are exported.

NEBRASKA, a western state of the American Union, the 24th admitted under the constitution, lying between lat. 40° and 43° N., and lon. 95° 25' and 104° W. from Greenwich. It is bounded N. by Dakota, E. by Iowa and Missouri, from which it is separated by the Missouri river, S. by Kansas and Colorado, and W. by Colorado and Wyoming; area, 75,995 sq. m. The width from N. to S. is about 210 m., and the length in the central part about 420 m. The state is divided into 64 counties (the N. W. portion being unorganized), viz.: Adams, Antelope, Boone, Buffalo, Burt, Butler, Cass, Cedar, Chase, Cheyenne, Clay, Colfax, Cuming, Dakota, Dawson, Dixon, Dodge,

Douglas, Dundy, Fillmore, Franklin, Frontier, Furnas, Gage, Garber, Gosper, Greeley, Hall, Hamilton, Harlan, Hitchcock, Holt, Howard, Jefferson, Johnson, Kearney, Keith, Knox, Lancaster, Lincoln, Madison, Merrick, Nemaha, Nuckolls, Otoe, Pawnee, Pierce, Phelps, Platte, Polk, Red Willow, Richardson, Saline, Sarpy, Saunders, Seward, Sherman, Stanton, Thayer, Valley, Washington, Wayne, Webster, York. The capital is Lincoln, in the S. E. part of the state, which in 1870 had 2,441 inhabitants, and in 1874 about 6,500. Omaha, on the E. border, is the chief city, having 20,000 inhabitants in 1874; next in importance is Nebraska City, containing 6,050 inhabitants in 1870. The total population of Nebraska (exclusive of Indians not taxed) in 1860 was 28,841, and in 1870, 122,993, including 122,117 white, 789 colored, and 87 Indians; 70,425 males and 52,568 females; 92,245 of native and 30,748 of foreign birth. Of those of native birth, 18,530 were born in the state, 9,655 in Illinois,

State Seal of Nebraska.

6,040 in Indiana, 7,611 in Iowa, 4,634 in Missouri, 9,246, in New York, 10,729 in Ohio, and 6,991 in Pennsylvania. Of the foreigners, 10,954 were natives of Germany, 2,635 of British America, 3,603 of England, 4,999 of Ireland, and 2,352 of Sweden. The density of population was 1.62 to a square mile. In 1874 the total population was returned at 223,657, the large increase since 1870 being mainly due to the construction of railroads. In 1870 the number of male citizens 21 years old and upward was 36,169. There were in the state 34,524 persons between the ages of 5 and 18 years; the total number attending school was 17,956; 2,365 persons 10 years of age and over were unable to read, and 4,681 could not write. The number of illiterates 21 years old and over was 2,125, of whom 1,169 were females. There were 22 blind, 55 deaf and dumb, 28 insane, and 25 idiotic. Of the total population 10 years old and over (88,265), there were engaged in all occupations 43,837; in agriculture, 23,115, of whom 5,899 were laborers and 17,037 farmers

and planters; in professional and personal services, 10,331, including 183 clergymen, 4,940 laborers not specified, 204 lawyers, 247 physicians and surgeons, and 316 teachers not specified; in trade and transportation, 4,628; and in manufactures and mechanical and mining industries, 5,763. The total number of deaths in 1870 was 1,000, being 0.81 per cent. of the population. The number of deaths from consumption was 87, being one to 11.5 deaths from all causes; from pneumonia 88, being one to 11.4 from all causes; from whooping cough 37, from measles 41, from scarlet fever 90, and from enteric fever 52. In 1873 there were 6,579 Indians in Nebraska, on reservations comprising 892,800 acres. In the N. W. part of the state were 917 Santee Sioux, occupying 83,200 acres; in the central, 2,000 Pawnees on 288,000 acres; in the N. E., 1,522 Winnebagoes on 128,000 acres, and 1,001 Omahas on 345,600 acres; in the S. E., 221 Iowas and 95 Sacs and Foxes of Missouri, on 32,000 acres; and in the S., 447 Otoes and Missouris, on a reservation of 16,000 acres. Schools are maintained among these tribes, and other efforts are made by the general government to civilize them.—The general surface of Nebraska approximates to a vast plain, rising gradually from the Missouri toward the mountains. The bottoms are level; the prairies, of which the surface mostly consists, are either gently undulating or broken into low hills and ridges. There are few hills of magnitude, and no mountains except at the west and northwest, where the land rises into the Black Hills and Rocky mountains. No large lakes have been discovered, but lakelets, rivers, and streams are numerous. The only navigable river, however, is the Missouri, which forms the N. E. and E. boundary line. Entering the state near the N. W. corner, and flowing E., is the Niobrara, which, after forming a portion of the N. boundary, empties into the Missouri near the N. E. corner of the state. The Keya Paha, a tributary of the Niobrara, also forms the boundary line for a short distance on the north. The principal river is the Platte, which, rising in the Rocky mountains in Colorado, flows E. through the central portion of the state, and empties into the Missouri. It is wide, rapid, and shallow, and passes through a valley which is remarkable for its fertility, and which for 200 m. W. from Omaha is from 8 to 10 m. wide. The Platte has numerous tributaries on the north, the chief of which are Wood river, Loup fork, and Elkhorn river. It has no important tributary from the south, but that portion of the state is well watered by streams flowing into Kansas, the chief being the Republican, Little Blue, West Blue, and Big Blue rivers. The Great Nemaha and Little Nemaha are small rivers in the S. E. part of the state, flowing into the Missouri.—Excepting that made in 1867 under the direction of the United States geologist, Dr. F. V. Hayden, there has been no geological survey of Nebraska. But four of the principal geological

formations are represented in the state, carboniferous, Permian, cretaceous, and tertiary. Of the carboniferous strata only the upper members occur, and these are overlaid, from the longitude of Lincoln west, by the Permian, cretaceous, and tertiary deposits. Minerals have not yet been found to any considerable extent. Thin beds of bituminous and block coal exist in the S. E. counties, and of lignite in the cretaceous and tertiary. The scarcity of coal renders more valuable the extensive beds of peat found in some parts of the state. Some iron ores occur, but the coal yet found is not sufficient to utilize them. Stone for building purposes is found, including limestone, dark yellowish gray sandstone, and a dark red free-stone. Clay for the manufacture of brick is easily obtained, and good potter's clay is abundant. In the S. E. portion of the state are extensive saline deposits. The principal basin is in Lancaster co. near Lincoln, and embraces an area of 12 by 25 m. These springs contain by weight 29 per cent. of remarkably pure salt. The salt is obtained by solar evaporation, which is facilitated by the marked dryness of the atmosphere. Alum has also been discovered.—The eastern portion of Nebraska is a rich agricultural region, while the western half is well adapted to grazing. The line of division is about lon. 99° W., although there is a large amount of fine agricultural lands W. of this line, and some grazing lands E. of it. The agricultural region embraces about 30,000 sq. m., extending about 150 m. W. of the Missouri, and in the valley of the Platte about 300 m. It is divided into bottom and prairie lands. The soil of the latter is a rich, black vegetable mould from 2 to 5 ft. deep, slightly impregnated with lime, and withstands great extremes of drought. The bottom lands along the river banks have a rich alluvial soil. Wheat, corn, barley, oats, sorghum, flax, hemp, and all vegetables flourish, and below lat. 42° sweet potatoes are easily cultivated. Wild plums and grapes are found in great abundance, while raspberries, strawberries, gooseberries, cherries, and other small fruits are common. Tobacco also finds a congenial soil and climate. Apples, plums, and pears are cultivated, and peaches succeed S. of the Platte river. The wild grasses, of which Dr. Aughey has classified 150 species, grow luxuriantly upon the bottom and table lands, yielding from one and a half to three tons per acre; many are exceedingly nutritious, and admirably adapted to the raising of sheep and cattle. Cultivated grasses, as the blue grass of Kentucky and timothy, are raised with great success. Large numbers of cattle are brought from Texas and Kansas to be fattened on the grasses of Nebraska, preparatory to sale. The grazing region comprises about 23,000,000 acres, and is generally well watered. Wood is of free natural growth only on the bluffs and river banks, but the species are numerous. Cottonwood is the most common; oak, elm, maple, black walnut, cedar, hickory, and hack-

berry are also found. Planted timber grows rapidly on the prairie. Forests of pine are reported to exist in the N. W. part of the state.—The climate is dry and exhilarating; the mean temperature in winter is about 22°, and in summer about 70°. The heat of the summer is tempered by the prairie winds, and the nights are generally cool. According to the observations made by the United States signal service at Omaha (lat. 41° 16', lon. 96°), the annual mean as indicated by the barometer was 29.9 inches; thermometer, 48.1°; total fall of rain, including snow, 34.8 inches; prevailing wind, southeast. The greatest amount of rain falls in May and June. Of the total area of the state (48,636,800 acres), 29,651,220 acres had been surveyed up to June 30, 1873. The number of acres of improved farm land in 1870 was 647,031; number of farms, 12,301, of which 787 embraced less than 10 acres each, 1,541 from 10 to 20, 5,096 from 20 to 50, 3,379 from 50 to 100, 1,487 from 100 to 500, and 11 from 500 to 1,000; cash value of farms, \$30,242,186; of farming implements and machinery, \$1,549,716; wages paid during the year, including the value of board, \$882,478; estimated value of all farm productions, including betterments and additions to stock, \$8,604,742; value of orchard products, \$9,932; of produce of market gardens, \$30,649; of forest products, \$36,307; of home manufactures, \$36,951; of animals slaughtered or sold for slaughter, \$854,850; of live stock, \$6,551,185. The productions were 2,109,321 bushels of spring and 15,765 of winter wheat, 13,532 of rye, 4,736,710 of Indian corn, 1,477,562 of oats, 216,481 of barley, 3,471 of buckwheat, 3,332 of peas and beans, 739,984 of Irish potatoes, 762 of sweet potatoes, 133 of grass seed, 404 of flaxseed, 5,988 lbs. of tobacco, 74,655 of wool, 1,539,535 of butter, 46,142 of cheese, 100 of hops, 24 of flax, 10 of maple sugar, 707 of wax, 28,114 of honey, 77,598 gallons of sorghum molasses, 470 of wine, 95,059 of milk sold, and 169,354 tons of hay. The live stock consisted of 30,511 horses, 2,632 mules and asses, 28,940 milch cows, 5,931 working oxen, 45,057 other cattle, 22,725 sheep, and 59,449 swine, besides 3,390 horses and 812,788 cattle not on farms. There were 670 manufacturing establishments, having 63 steam engines of 1,865 horse power and 67 water wheels of 1,446 horse power; hands employed, 2,665; capital invested, \$2,169,963; wages paid during the year, \$1,429,913; value of materials used, \$2,902,074; of products, \$5,738,512. The statistics of the principal branches are as follows:

INDUSTRIES.	Number of establishments.	Hands employed.	Capital invested.	Value of products.
Blacksmithing.....	90	188	\$77,210	\$287,900
Boots and shoes.....	50	125	74,110	195,722
Bread and other bakery products.....	16	89	35,650	60,350
Brick.....	17	109	22,900	61,865
Butchering.....	9	89	53,700	311,328

INDUSTRIES.	Number of establishments.	Hands employed.	Capital invested.	Value of products.
Carpentering and building.	89	216	\$45,435	\$535,520
Clothing.	87	75	29,610	106,605
Flouring mill products.	60	183	591,900	1,516,150
Furniture.	16	27	17,605	38,980
Gas.	1	5	20,000	44,955
Iron castings.	3	65	67,840	196,518
Jewelry.	14	32	71,100	67,200
Liquors, distilled.	1	14	85,000	146,789
" malt.	15	39	52,400	53,832
Lumber, sawed.	50	202	152,200	278,205
Machinery, railroad repairing.	4	701	368,810	797,423
Painting.	16	35	15,400	46,250
Printing and publishing, newspaper.	10	94	92,100	161,400
Saddlery and harness.	28	71	51,075	152,657
Soap and candles.	3	7	8,800	25,900
Tin, copper, and sheet-iron ware.	27	72	43,650	159,973
Tobacco, cigars.	12	43	29,400	109,734

Manufacturing industries and trade have largely increased since 1870. Nebraska has only a domestic commerce. In 1874 more than 1,500,000 bushels of grain were sent to market by the Burlington and Missouri River railroad alone. Omaha was in 1870 made a United States port of delivery, belonging to the customs district of Louisiana. In November, 1874, 10 national banks were in operation, with a paid-in capital of \$1,025,000 and an outstanding circulation of \$895,900, being \$7 28 per capita, 1·3 per cent. of the wealth of the state, and 87·4 per cent. of the banking capital. The state had 122 m. of railroad in 1865, 473 in 1867, 943 in 1871, 1,075 in 1873, and 1,120 in 1874. In the last named year several important railroads were projected and in process of construction. The lines in operation in 1874 are represented in the following statement :

NAMES OF CORPORATIONS.	TERMINI.	Miles completed in the state in 1874.	Total length between termini when different from preceding.
Atchison and Nebraska.	Atchison, Kan., and Lincoln.	109	147
Brownville and Fort Kearney.	Brownville and Junction of St. Joseph and Denver City railroad.	10	98
Burlington and Missouri River.	Plattsmouth and Kearney Junction.	190
Leased, Omaha and Southwestern.	Omaha and Oreadopolis.	18
Midland Pacific.	Crete and Beatrice.	30
Omaha and Northwestern.	Nebraska City and Seward.	88
St. Joseph and Denver City.	Omaha to southern line of Dakota.	40	180
Sioux City and Pacific.	Elwood, Kan., and Hastings.	89	227
Leased, Fremont, Elkhorn, and Mo. Valley.	Sioux City, Ia., and Fremont.	27	107
Union Pacific.	Fremont and Wisner.	51
	Omaha and Ogden, Utah.	473	1,038

—The constitution of 1866 limits the number of senators to 13 and of representatives to 39 until 1876, when the number may be increased by the legislature, but not beyond 25 senators and 75 representatives. Senators and representatives are elected biennially on the second Tuesday of October in even years, and hold office for two years from the first of January ensuing. The legislature meets biennially on the Thursday after the first Monday in January, odd years. Each member receives \$3 for each day's attendance during the session, and 10 cents for every mile of travel in going to and from the capital. Compensation is not allowed for more than 40 days at any one session. The executive department comprises a governor, secretary of state, auditor, and treasurer, who are chosen at the same time as members of the legislature and hold their offices for two years, except the auditor, whose term is four years. The constitution fixes the annual salary of the governor at \$1,000; secretary of state, \$600; auditor, \$800; treasurer, \$400. The judicial power is vested in a supreme court and district, probate, and justices' courts. The supreme court comprises a chief and two associate justices, who are elected by the people for six years, and receive an annual salary of \$2,000 each. All other judicial officers are paid for their services, the fees being prescribed by law. Two terms of the supreme court are held each year in Lincoln. The state is divided into three judicial districts, in which the courts

are held by the justices of the supreme court. Each county has a probate court, which, besides the ordinary duties of such tribunals, has jurisdiction in civil actions where the amount does not exceed \$500. Probate judges and justices of the peace are elected by the people. The property owned by a woman at her marriage, and any property which she may subsequently acquire, except from her husband, is free from the husband's control and not subject to his debts. A married woman may convey her separate estate, make contracts, carry on a trade or business, and sue and be sued, in the same manner as an unmarried woman. The grounds of divorce are: adultery, impotence, sentence to imprisonment for three years or more, desertion for two years, habitual drunkenness, extreme cruelty, and consent obtained by force or fraud. The legal rate of interest in absence of agreement is 10 per cent., and 12 per cent. may be lawfully agreed upon. Nebraska is represented in congress by two senators and one representative, and has therefore three votes in the electoral college.—Practically the state has no debt. On Nov. 30, 1874, the outstanding liabilities amounted to \$352,400, of which \$342,957 was held by the permanent school fund, the state paying interest; and the state had resources to the amount of \$221,600, consisting of unpaid taxes, &c. The receipts and disbursements of the state government for the eleven months ending Dec. 1, 1874, were reported as follows:

FUNDS.	Receipts.	Disbursements.
General fund.....	\$529,704 95	\$507,584 87
Sinking fund.....	117,553 69	126,554 94
Permanent school fund.....	252,518 47	258,303 13
Temporary school fund.....	467,008 88	864,387 93
Temporary university fund.....	50,292 46	50,292 46
Judiciary fund.....	12,773 41	11,488 86
Penitentiary building fund.....	27,223 47	21,575 97
Insane asylum building fund.....	86 50	50 00
Normal school building fund.....	5,875 20	8,759 18
Normal school tuition fund.....	4,733 85	4,597 82
Salt (royalty) fund.....	52 66	78,377 12
State building fund.....	1,250 00	1,250 00
In hand Jan. 1, 1873.....	198,287 65
Total.....	\$1,667,695 69	\$1,433,152 28
Balance in treasury, Nov. 30, 1874.....	\$234,548 41

The total valuation of the state, as reported by the state board of equalization, was \$55,549,867 in 1871, \$69,873,818 in 1872, \$78,419,480 in 1873, and \$81,218,813 in 1874. In the last year the lands held by private owners and subject to taxation amounted to 11,000,579 acres, the assessed value being \$43,004,800; town lots, \$9,941,809; money used in merchandise, \$2,448,235; in manufactures, \$522,410; stocks and shares, \$979,455; moneys and credits, \$1,578,329; household furniture, \$343,762. There were 87,449 horses, valued at \$3,906,778; 229,469 neat cattle, \$2,973,221; 7,615 mules and asses, \$417,911; 30,329 sheep, \$42,556; and 233,652 swine, \$367,576. The railroad property was valued at \$11,183,114, and telegraph property at \$61,555. The taxes levied for 1874 amounted to \$502,933 78, being 6½ mills on the dollar, viz.: for the general fund, \$200,995 77, 2½ mills; sinking fund, \$79,864 77, 1 mill; school fund, \$161,507 89, 2 mills; penitentiary fund, \$40,376 94, ½ mill; and university fund, \$20,188 41, ¼ mill. The property of corporations is taxed in the same manner as that of individuals. The institutions supported by the state are the institute for the deaf and dumb opened at Omaha in 1869, the asylum for the insane opened at Lincoln in 1871, and the penitentiary, which is also at Lincoln. In 1875 an act was passed to establish an asylum for the blind at Nebraska City.—The school lands of Nebraska comprise about 2,700,000 acres, which, if sold at the minimum price (\$7 per acre), would give a permanent school fund of \$18,900,000. The schools are supported by the proceeds arising from the sale and lease of school lands, from a general tax of two mills, and from fines, licenses, and dog tax. The apportionment is made by the state superintendent among the counties according to the number of children between the ages of 5 and 21 years. In June, 1874, \$107,764 were distributed among 72,991 children. To be entitled to a share of the state fund, districts having fewer than 75 pupils must support a school not less than three months, those having between 75 and 200 not less than six months, and those having more than 200 not less than nine months. There is no state board of education. The superintendent of public instruction is elected

by the people for four years, and receives an annual salary of \$2,000. County superintendents are also elected by popular vote. The most important statistics for the year ending Jan. 1, 1875, were as follows:

Number of school districts.....	2,215
“ “ houses.....	1,516
“ “ children.....	72,991
“ attending school.....	47,718
“ of male teachers.....	1,252
“ of female teachers.....	1,483
Average monthly wages of male teachers.....	\$87 98
“ “ of female teachers.....	\$82 12
Number of private schools.....	80
“ of pupils in private schools.....	863
Tax for building school houses.....	\$204,998
“ teachers' wages.....	\$73,920
Amount raised from all other sources.....	\$271,653
Total resources.....	\$988,740
Total expenditures for schools.....	\$1,004,957
Amount apportioned by state superintendent.....	\$292,471
“ per pupil.....	\$4 00
“ apportioned by county superintendents.....	\$201,871
Value of school houses and sites.....	\$1,546,480

The state normal school is at Peru, having a fine brick structure 90 by 63 ft. and three stories high above the basement. The institution comprises a model school with primary, junior, and senior departments, and a normal school with a three years' course of instruction. Tuition is free. During the fall term of 1873 there were 201 pupils in the model and 60 in the normal department. The number of teachers in the latter was six. Normal institutes are also held throughout the state, but not at the public expense. The university of Nebraska, at Lincoln, constitutes a part of the educational system of the state. It owes its existence to a congressional grant of 44,800 acres of land for the support of a state university, and the donation of 90,000 acres granted by congress to Nebraska for the establishment of a state college of agriculture and the mechanic arts. By the same law of 1869 the regents were authorized to establish a university comprising six departments or colleges: 1, a college of ancient and modern languages, mathematics, and natural science; 2, of agriculture; 3, of law; 4, of medicine; 5, of practical science, mechanics, and civil engineering; 6, of fine arts. The institution was opened in the autumn of 1871. In 1872 the department of literature, science, and art was organized, with two courses of four years each, and in 1873 that of agriculture, with courses of two, three, and four years. In 1873-'4 there were 7 instructors and 100 students. Both sexes are admitted. The other leading educational institutions are Nebraska college (Protestant Episcopal), at Nebraska City, and Doane college (Congregational), at Crete. The former affords instruction in classics, mathematics, science, and business, and has also a theological department. In 1874 it had a total of 10 instructors and 88 students. Doane college had 4 instructors and 50 students.—According to the census of 1870, there were in the state 390 libraries, having 147,040 volumes, of which 219 with 95,125 volumes were private, and 171 with 51,915 volumes were other than pri-

vate. The whole number of newspapers and periodicals was 42, having an aggregate circulation of 31,600, and issuing annually 3,388,500 copies. There were 7 daily, with a circulation of 6,850; 1 tri-weekly, 500; 30 weekly, 22,400; and 4 monthly, 1,850. In 1874 the total number had increased to 95, including 10 daily, 1 semi-weekly, 77 weekly, 1 semi-monthly, and 6 monthly. The total number of religious organizations in 1870 was 181, having 108 edifices, with 32,210 sittings, and property valued at \$386,000. The leading denominations were represented as follows:

DENOMINATIONS.	Organizations.	Edifices.	Sittings.	Property.
Baptist, regular.....	26	15	5,400	64,800
Christian.....	9	4	1,550	14,500
Congregational.....	10	7	2,050	38,500
Episcopal, Protestant...	15	12	3,500	81,000
Evangelical Association.	5	3	600	7,000
Lutheran.....	14	7	2,000	27,900
Methodist.....	50	36	10,150	113,400

—The territory of Nebraska was formed May 30, 1854, embracing 351,558 sq. m., extending from lat. 40° N. to the national boundary, and from the Missouri river W. to the crest of the Rocky mountains. On Feb. 28, 1861, 16,035 sq. m. were set off to the territory of Colorado, and on March 2, 228,907 sq. m. to Dakota. At the latter date Nebraska received from Washington and Utah territories a triangular tract of 15,378 sq. m. lying on the S. W. slope of the Rocky mountains N. of the 41st parallel and E. of the 110th meridian. This, however, was included in the 45,999 sq. m. taken from Nebraska March 3, 1863, to form the territory of Idaho. Nebraska was thus reduced to its present limits. In March, 1860, the question of forming a state government was submitted to the people and disapproved by a vote of 1,877 to 1,987. On April 19, 1864, an enabling act was passed by congress, providing for the admission of Nebraska into the Union; but the necessary action for admission was not taken at that time by the territory. The continuance of the war and the prevalence of Indian hostilities checked the growth of Nebraska; but prosperity came with the return of peace. Early in 1866 the territorial legislature framed a constitution, which was ratified by the people on June 21. The first legislature under the new government assembled July 4. On the 28th a bill for the admission of Nebraska as a state was passed by congress, but did not receive the signature of the president. In January, 1867, another bill for this purpose was passed, but was vetoed by the president on the ground that it embraced conditions not contained in the enabling act, that the proceedings attending the formation of the constitution were different from those

prescribed, and that the population of the territory did not justify its becoming a state. The bill, however, was passed over the executive veto by a vote of 30 to 9 in the senate, Feb. 8, and 120 to 44 in the house on the following day. The act was not to take effect "except upon the fundamental condition that, within the state of Nebraska, there shall be no denial of the elective franchise, or of any other right, to any person by reason of race or color, except Indians not taxed; and upon the further fundamental condition that the legislature of said state, by a solemn public act, shall declare the assent of said state to the said fundamental condition." This act was ratified by the legislature, which assembled at Omaha on Feb. 20 for that purpose, and compliance with the congressional conditions was announced by proclamation of the president of the United States, March 1, 1867. Soon after Lincoln was chosen as the seat of government. On May 2, 1871, delegates were elected to a convention to frame a new state constitution. This convention was in session from June 5 to Aug. 19, and completed a constitution which was rejected by the people, Sept. 19. Another convention was ordered. (See supplement.)

NEBRASKA CITY, a city and the capital of Otoe co., Nebraska, on the Missouri river, at the terminus of the Midland Pacific railroad, 35 m. S. of Omaha, and 45 m. E. by S. of Lincoln; pop. in 1860, 1,922; in 1870, 6,050. The Kansas City, St. Joseph, and Council Bluffs railroad runs along the opposite bank. The city is handsomely situated on rising ground, and is surrounded by a fine agricultural country. It has a beautiful brick court house, an opera house, gas works, two national banks, a private bank, an elevator, flouring mills, a distillery, two plough manufactories, four large public schools, a public library, two daily and four weekly (one German) newspapers, a Catholic convent, and 13 churches. It is the seat of Nebraska college, an Episcopal institution, which was organized in 1865, and has theological, collegiate, and preparatory or business departments. In 1874-'5 it had 10 professors and instructors, 88 students (most of whom were in the business department), and a library of 1,500 volumes. Nebraska City was founded in 1855.

NEBUCHADNEZZAR (on the Babylonian monuments, *Nabu-kuduri-uzur*), a Chaldean king of Babylon, born about 645 B. C., died in 561. He was the son of Nabopolassar, who toward the close of his reign sent him to repel the invasion of the Egyptian king Necho. He routed the Egyptians, and pursued them through Judea, which he reduced to a Babylonian dependency, but was recalled to Babylon by the death of his father (604), whom he succeeded as king. He brought back a multitude of captives, and employed them as slaves in the construction of gigantic works, the remains of which are still visible. He rebuilt all the cities of upper Babylonia upon a magnificent scale, and embellished

them with temples, palaces, aqueducts, and other public works. The ruins of more than 100 towns and cities contain inscriptions of his name. (See BABYLON, and BABYLONIA.)

Early in his reign the Jews and Phœnicians rebelled. Nebuchadnezzar took Jerusalem, carried many of its chief people away captive, including Jehoiachin the king, and made Zedekiah king as his vassal; and when several years later he rebelled, being aided by Egypt, Nebuchadnezzar again besieged Jerusalem, and after defeating the Egyptian king Apries (the Pharaoh-Hophra of Scripture), who came to its relief, compelled it to surrender. (See HEBREWS, vol. viii., p. 589.) During these wars his armies invested Tyre, and took it after a siege of 13 years. Four years later he marched through Palestine into Egypt, which he ravaged, but did not completely subjugate. He elevated Daniel and other Hebrew captives to high office in Babylon. (See DANIEL.)

The book of Daniel relates how he fell under the divine judgment on account of his pride, lost his reason, was deprived of his kingdom, and lived the life of a beast; and how he was restored to health and power, and acknowledged the judgment of God. It has been thought that his malady was a form of the madness called lycanthropy, in which the patient imagines himself a beast.

NEBULA (Lat., mist, vapor), an aggregation of stars or stellar matter having the appearance, through an ordinary telescope, of a small, cloud-like patch of light. An enlargement of telescopic power usually converts this appearance into a cluster of innumerable stars, besides bringing to light other nebulae before invisible. These in turn yield to augmented magnifying power; and thus every increase in the capacity of the telescope adds to the number of clusters resolved from nebulae, and of nebulae invisible to lower powers. Nebulae proper, or those which have not been definitely resolved, are found in nearly every quarter of the firmament, though abounding especially near those regions which have fewest stars. Scarcely any are found near the milky way, and the great mass of them lie in the two opposite spaces furthest removed from this circle. Their forms are very various, and often undergo strange and unexpected changes as the power of the telescope with which they are viewed is increased, so as not to be recognizable in some cases as the same objects. The spiral nebulae are an example of this transformation. This class was recognized by Lord Rosse through the use of his six-foot reflector. Many of them had been long known as nebulae, but their characteristic spiral form had never been suspected. They have the appearance of a maelstrom of stellar matter, and are among the most interesting objects in the heavens.

There is another class of nebulae which bear a close resemblance to planetary disks, and are hence called planetary nebulae. They are very

FIG. 1.—Spiral Nebula in Canes Venatici.

rare. Some of them present remarkable peculiarities of color. Sir John Herschel has described a beautiful example of this class, sit-

FIG. 3.—Planetary Nebula.

uated in the southern cross. But in telescopes of the highest power some of the so-called

FIG. 4.—Annular Nebula in Lyra.

planetary nebulae assume a totally different appearance; and many of them are singularly complicated in structure, instead of being

simple globes of nebulous matter, as was formerly supposed. There are several which have perfectly the appearance of a ring, and are called annular nebulae. A conspicuous and beautiful example is situated in Lyra. Some appear to be physically connected in pairs like double stars. Most of the small nebulae have the general appearance of a bright central nucleus enveloped in a nebulous veil. This nucleus is sometimes concentrated as a star and sometimes diffused. The enveloping veil is sometimes circular and sometimes elliptical, with every degree of eccentricity between a circle and a straight line. There are some which, with a general disposition to symmetry of form, have great branching arms or filaments with more or less precision of outline. An example of this is Lord Rosse's Crab nebula. Another remarkable object is the nebula in Andromeda, which is visible with the naked eye, and is the only one which was discovered before the invention of the telescope. Simon Marius (1612) describes its appearance as that of a candle shining through horn. Besides the above, which have comparatively regular forms, there are others more diffused, and devoid of symmetry of shape. A remarkable example is the great nebula in Orion, discovered by Huygens in 1656. This nebula and that in Andromeda have been admirably delineated by the professors Bond of Harvard observatory. (See "Memoirs of the American Academy of Arts and Sciences," new series, vol. iii.) The great nebula in Argo, which Sir John Herschel has charted with exquisite care and elaborateness in his "Cape Observations," is another example of this class. In the southern firmament there are two extensive nebulous tracts known as the Ma-

FIG. 5.—Great Nebula in Orion.

gellanic clouds; the greater called Nubecula Major, and occupying an area of 42 square degrees; the smaller called Nubecula Minor, and covering about 10 square degrees. In these tracts are found multitudes of small nebulae and clusters. The number of these

wonderful objects which have been recognized in all the heavens is upward of 5,000. Of these fewer than 150 were known prior to the time of Sir William Herschel. In 1786 he communicated to the royal society a catalogue of 1,000 new nebulae and clusters; in 1789 a

FIG. 6.—Large Magellanic Cloud.

second catalogue of the same number of new objects; and in 1802 a third which included 500 more. In 1833 Sir John Herschel communicated to the royal society a catalogue of 2,306 nebulae and clusters in the northern hemisphere observed by him, 500 of which were new. In 1847 appeared his "Cape Observations," which contained catalogues of 1,708 nebulae and clusters in the southern heavens. —The application of spectroscopic analysis to these objects, by Huggins, Secchi, Vogel, and others, has resulted in the noteworthy discovery that while some among the nebulae are really clusters of stars, others consist in the main of gaseous matter. The former give spectra resembling in their general characteristics the spectra of stars; the latter give a spectrum of three bright lines (occasionally four), one line corresponding in position to a line in the spectrum of hydrogen, another corresponding to a line in the spectrum of nitrogen. The resolvable nebulae mostly give spectra of the former class, while the bright-line spectrum is given by all the irregular nebulae hitherto examined, and by the planetary nebulae. Of about 70 nebulae examined by Huggins, nearly one third gave the spectrum indicative of gaseity, the rest giving a stellar spectrum. —As to the nature of nebulae, two chief theories have been advanced. It was first suggested by Wright of Durham, and afterward maintained by Kant and Lambert, that the nebulae are stellar galaxies similar to our own star system. Sir W. Herschel, at the beginning of his researches into the constitution of the universe, adopted this view as respects certain nebulae which he regarded as external, while holding

(contrary to the usual statement in our text books of astronomy) that many nebulae form parts of our own star system. At a later stage of his labors he advanced the hypothesis commonly known as Herschel's nebular hypothesis, which however related only to certain orders of nebulae. At this stage Herschel for the first time indicated his ideas respecting the arrangement of all orders of stellar aggregations and nebulous matter. At the lower extremity of the scale he placed widely spread luminosity, such as he had first described in 1802. He passed from this irregularly spread luminosity, through all the orders of gaseous nebulae (irregular nebulae, planetary nebulae, nebulous stars) formed by the gradual condensation of the gaseous matter, until the star itself is formed; then he entered on the part of the series he had before recognized, passing on to the various orders of stellar aggregation, diffused clusters, ordinary stellar nebulae, and more and more condensed groups of stars, up to the richest star clusters. At this period (1814) we no longer find him speaking of external nebulae; not, it is to be presumed, that he no longer recognized the probability that other stellar galaxies besides our own exist, but that he no longer found it possible to discriminate those nebulae which are external from the far greater number which unquestionably form component parts of our sidereal system. The researches of the present writer into the subject dispose him to believe that our sidereal system extends far beyond the limits which have ordinarily been assigned to it, and that there are no nebulae which can be regarded as external to it. (See supplement.)

NEBULAR HYPOTHESIS. the celebrated speculation of Sir William Herschel, adopted and developed by Laplace, assigning the genesis of the heavenly bodies to the gradual aggregation and condensation of a highly attenuated self-luminous substance diffused through space. (See "Philosophical Transactions," 1802 and 1811.) To this hypothesis Herschel was led by his conclusion that there were nebulosities not composed of stars. The Rosse telescope having decomposed nebulae hitherto considered to be irresolvable, and exhibited symptoms of resolvability in others still more intractable, it was assumed that all nebulae are stellar, their nebulosity being solely a question of distance; and thus, the basis of Herschel's reasoning failing, the fabric of his hypothesis was thought to be demolished. Mr. Herbert Spencer came to its support in the "Westminster Review," No. cxxxvii. (July, 1858). The argument in its favor is substantially as follows. The assumption that all nebulae are remote galaxies does not invalidate the indications furnished by the structure of the solar system, which still points to a nebular origin just as significantly as before. But the assumption is inadmissible. The mode of distribution of the nebulae furnishes evidence of a physical connection with our stellar system; and this

evidence is confirmed by the fact of their resolvability with telescopic power which fails to make individually visible the most distant stars of our own milky way. If they are remote galaxies, it may be assumed that, speaking generally, the largest are the nearest, and therefore the most resolvable. But the fact is, the smallest are the most resolvable. Another difficulty is presented by the Magellanic clouds. (See NEBULA.) Sir John Herschel, considering the structure of the larger of these clouds, concludes that "it must be taken as a demonstrated fact that stars of the seventh or eighth magnitude, and irresolvable nebula, may coexist within limits of distance not differing in proportion more than as 9 to 10." ("Outlines of Astronomy," London, 1851, p. 615.) This clearly supplies a *reductio ad absurdum* of the popular doctrine. Assuming, for the sake of the argument, a rare, homogeneous, nebulous matter, widely diffused through space, the following successive changes will, on physical principles, take place in it: 1, mutual gravitation of its atoms; 2, atomic repulsion; 3, evolution of heat, by overcoming this repulsion; 4, molecular combination, at a certain stage of condensation, followed by, 5, sudden and great disengagement of heat; 6, lowering of temperature by radiation and consequent precipitation of binary atoms, aggregating into irregular flocculi and floating in the rarer medium, just as water when precipitated from air collects into clouds; 7, each flocculus will move toward the common centre of gravity of all; but being an irregular mass in a resisting medium, this motion will be out of the rectilinear, that is to say, not directly toward the common centre of gravity, but toward one or other side of it; and thus, 8, a spiral movement will ensue, which will be communicated to the rarer medium through which the flocculus is moving; and, 9, a preponderating momentum and rotation of the whole mass in some one direction, converging in spirals toward the common centre of gravity. Certain subordinate actions are to be noticed also. Mutual attraction will tend to produce groups of flocculi concentrating around local centres of gravity, and acquiring a subordinate vortical movement. These conclusions are shown to be in entire harmony with the observed phenomena. In this genetic process, when the precipitated matter is aggregating into flocculi, there will be found here and there detached portions, like shreds of cloud in a summer sky, which will not coalesce with the larger internal masses, but will slowly follow without overtaking them. These fragments will assume characteristics of motion strikingly correspondent to those of the comets, whose physical constitution and distribution are seen to be completely accordant with the hypothesis.—The physical characters resulting from the hypothesis are found to tally with the facts. In a rotating spheroid of æriform matter in the latter stages of

concentration, but before it has begun to take a liquid or solid form, the following actions will go on: 1, more and more rapid aggregation of its atoms into a smaller and denser mass, as the common centre of gravity is approached; 2, development of oblateness; 3, evolution of heat, greatest at the central parts; and, as a consequence, 4, circulation—currents setting from the centre toward the poles and thence to the equator, and counter currents from the equator to the centre. In the course of this round there will be, 5, an oscillation of temperature: first, from the centre outward—expansion by diminished pressure and other causes, and consequent lowering of temperature; secondly, from the equator inward—rise in temperature for converse reasons. 6. As a corollary to 4 and 5, external condensation will occur according to the laws of precipitation from gases, resulting in a belt of vapor about the equator, gradually widening and condensing into a fluid; 7, this fluid film will gradually extend itself till it eventually closes over at the poles, thus forming a thin hollow spheroid filled with gaseous matter; 8, at length the liquid shell will become very thick, the outer surface will experience a fall of temperature and begin to harden into a solid crust. This hypothesis explains the relative specific gravities of the planetary bodies, the formation of the asteroids, the earth's supposed interior structure, indications of past or present high temperature throughout the solar system, and the sun's incandescence.—These considerations relate chiefly to the physical changes undergone by a forming system. Laplace's nebular hypothesis deals with the changes of arrangement in the distribution of matter forming into a system under the action of dynamical laws. He takes as the basis of his theory certain features of our solar system which are not explained by the theory of gravitation. Gravity accounts for Kepler's laws, which are shown to be among its necessary consequences. No system could circulate in any manner around a centre, for instance, without the law holding that the numbers representing the cubes of the mean distances would be proportional to the numbers representing the squares of the periodic times. But a system could exist under gravity in which the planets would travel in widely eccentric orbits or in planes largely inclined to each other. Nor has it been proved that the planets might not safely circulate in different directions. Assuredly, if revolution in different directions, or in planes largely inclined to each other, or in very eccentric paths, might in the long run result in collisions and therefore in the destruction of the system as such, there is yet no reason to believe that all the axial rotations need take place in the same direction as the motions of revolution. But, to say the truth, none of those laws of harmony in our solar system, except the laws depending directly on gravity, can be regarded as essential

to the well being of the system; nor, as will presently appear, would the difficulty of regarding the system as other than a product of evolution be appreciably diminished by supposing that without those laws the destruction of the system must inevitably have occurred in the course of time. For it would be manifestly unreasonable to regard our system as one in which the original arrangements were fortuitously so happy that it has continued to exist as a system, if we find that the probability of these arrangements so existing by mere coincidence is exceedingly minute. Now, how small this probability is may be inferred by considering only the motion of the planets in one common direction. There are known at the present time 8 major planets and 137 minor planets (the number of these is increasing year by year). Thus there are 145 known planets. Taking the earth's direction of revolution as a standard direction, the chance that any one of the remaining 144 planets would have this direction as a result of mere chance is of course one half, since a planet must revolve in one of two ways. Therefore, by the laws of probability, the chance that all the 144 other planets would revolve in that direction is represented by a fraction whose numerator is unity and its denominator 2 raised to the 144th power. Now 144 times the logarithm of 2, (or $\cdot 3010300$) = $43\cdot 3483200$, showing that the above mentioned denominator is a number of 44 digits, beginning 2230077 with 37 digits to follow. This inconceivably enormous number represents the odds to 1 against the observed arrangement being the result of chance, even considering only one relation out of several mentioned above, all of which present the same order of antecedent improbability. Thus Laplace was led to his conception of a vast rotating nebulous disk, from the gradual contraction of which, and the consequent throwing off of rings, breaking up into globes, all revolving and rotating in one common direction and nearly in the same level, the solar system was formed. This hypothesis, however, does not explain the distribution of the masses of the solar system; one planet (Jupiter), for example, containing nearly $\frac{2}{3}$ of all the matter outside the sun, and Saturn and Jupiter together containing about $\frac{1}{12}$ of all that matter. Accordingly, the present writer has suggested a modification of it, in which, starting from some such primary condition as that assumed by Herbert Spencer, the various parts of the solar system were formed by processes of aggregation such as are still going on (though now with extreme slowness). For the motions of the flocculi of Spencer (or of the parts, whatever their nature, from which the system was to be formed) would be more and more rapid with proximity to the central aggregation, according to well known dynamical laws. Accordingly, subordinate aggregations would form with difficulty close by the sun; and hence we can understand the smallness of the

members of the interior family of planets, comprising Mercury, Venus, the earth, and Mars. Again, with extreme distance from the centre, the gravity of available material whence aggregations could form would be so far reduced, that for that reason the planets so formed would be smaller. Hence we can understand why Uranus and Neptune are so far inferior to Jupiter and Saturn. These two giant orbs are thus seen to occupy the space where the conditions were most favorable to the rapid development of subordinate aggregations. In this intermediate region there was abundance of material while yet the motions were not so rapid that a subordinate aggregation could not readily master, so to speak, the matter rushing past toward the aphelion of its orbital motion round the sun. The theory also explains well the existence of a zone of discrete bodies next within the path of Jupiter, that is, in a region disturbed at once by his attraction and that of the sun.—It is not improbable, as remarked in the article METEOR, that the study of cometic and meteoric astronomy may before long throw considerable light on the question of the evolution of our solar system, and enable us to form a nebular hypothesis on safer grounds than those on which the theories in vogue are based. (See supplement.)

NECHO, or **Neco** (in the Bible also Pharaoh Necho, and in the hieroglyphics *Neku*), an Egyptian king of the 26th dynasty, who reigned, according to Rawlinson, from 610 to 594 B. C. He is called by Herodotus the son and successor of Psammetichus I., whose northeastern conquests he followed up with energy. He built a navy for the prosecution of maritime discovery, and began a canal to connect the Nile with the Arabian gulf, but is said to have abandoned this work because warned by an oracle that it would be used for the invasion of his country. Under his directions the Phœnicians circumnavigated Africa. He marched into Assyria to attack the Babylonians, and on his march defeated Josiah, king of Judah, in the valley of Megiddo (about 609). Advancing to the Euphrates, he took Carchemish and established a garrison there. On his homeward march he deposed Jehoahaz, king of Judah, putting his brother Eliakim or Jehoiakim into his place, as a vassal of Egypt; and it is thought that about this time he took Jerusalem. Herodotus says that he took a city named Cadytis, but its identification with Jerusalem is not certain. Three years later Carchemish was attacked by Nebuchadnezzar, and Necho having marched to its relief was defeated and lost all his Asiatic dominions. He never recovered from this blow, the rest of his reign being distinguished only by a weak and irresolute attempt to prepare for a new war against Babylon.

NECKAR, or **Necker**, a river of Germany, tributary to the Rhine, rising in Würtemberg E. of the Black Forest, near Schwenningen, on the frontiers of Baden, at an elevation of more

than 2,000 ft. above the sea. It first flows in a N. direction, crossing Hohenzollern, then N. E. and N. through Würtemberg, and finally N. W. through Baden, joining the Rhine at Mannheim. Its chief tributaries are the Enz, Kocher, and Jaxt. The principal places on its banks are Tübingen, Canstatt, near Stuttgart, Heilbronn, Heidelberg, and Mannheim. The entire length of the Neckar is about 250 m., and it is navigable nearly to Canstatt for small craft and to Heilbronn for steamers. The Neckar is remarkable for its lovely scenery, and excellent wine is produced along its shores.

NECKER. I. Jacques, a French statesman, born in Geneva, Switzerland, Sept. 30, 1732, died at Coppet, in the same country, April 9, 1804. After receiving a liberal education, he went to Paris at the age of 15, was employed as a clerk in a banking house, became a partner in the banking house of Thelusson, and afterward engaged in the same business alone. Having accumulated a fortune, he gave up business in 1764, and was appointed resident minister of Geneva at the court of France. From 1764 to 1770 he acted as syndic of the French East India company. His reputation was greatly increased by several publications, such as the *Éloge* on Colbert, to which the French academy awarded a prize, and an *Essai sur la législation et le commerce des grains* (1775); and in 1776 he was appointed assistant to the comptroller general Taboureaux, with the title of director of the treasury, and in 1777 director general or minister of finance. These appointments he accepted on condition that he should receive no emoluments. He introduced order and economy into that branch of the administration, restored confidence among capitalists by securing the payment of interest on loans, restrained the prodigality of the court, curtailed the expenses of the administration, reclaimed many public estates which had been unlawfully alienated, regulated the assessment of taxes, abridged the right of mortmain, established a uniform excise on salt all over the kingdom, and endeavored to suppress statute labor and tolls. He introduced improvements in the government of several provinces, and assisted in establishing the *mont de piété* of Paris and a bank of discount, out of which subsequently grew the bank of France. By his management a deficit of over 24,000,000 livres was made up, and in less than five years the annual receipts were 10,000,000 in excess of the annual expenditures. In 1781 he published his *Compte rendu au roi sur les finances de l'état*, an exposure which aroused the enmity of the courtiers, whose pensions and privileges had been abridged, and displeased the prime minister Maurepas. Necker, desiring to vindicate his measures before the king, insisted upon a seat in the royal council, from which he had been excluded on account of his religious persuasion. His claim being disregarded, he sent in his resignation. After his retirement he was involved in a

controversy with Calonne, who attacked his financial policy. In 1784 he published his *Administration des finances*, which was sold to the number of 80,000 copies in a few days. When his successors, Joly de Fleury, Calonne, and Loménie de Brienne, had exhausted all available means and brought the exchequer to a crisis, Necker was recalled by Louis XVI., and his return to power, Aug. 25, 1788, was hailed with general applause; confidence at once revived among all classes, and stocks rose 30 per cent. in a single day. But it was not a mere financial reform that was now needed; a political revulsion was at hand. Necker, relying upon his popularity, flattered himself that he could control the revolutionary movement; but from the beginning he acted timidly. The assembling of the states general had been promised by his predecessor, and he had to fulfil that promise. In opposition to the notables who insisted upon preserving the ancient mode of holding the states, he procured an order in council allowing the third estate a number of delegates about equal to that of the nobility and clergy combined. On the opening of the states general he made a report upon the condition of France, full of good wishes for the public welfare, but almost devoid of practical suggestions. After the royal session of June 23 he advised Louis XVI. to order the deputies of the nobles and the clergy to join those of the third estate. He was looked upon by the people as the staunchest supporter of their rights; but on July 11, 1789, he was dismissed by the king and secretly left France. Paris rose at once in the wildest excitement; his bust, with that of the popular duke of Orleans, was carried in a mourning procession through the streets; an insurrection was organized, and on the 14th the Bastille was taken. The king, yielding to popular clamor, sent immediately for his exiled minister, who was reinstated in office after an absence of 18 days. All the sources of public revenue were exhausted, and he had to provide for daily necessities. A loan for 30,000,000 livres and another for 80,000,000 were proposed by him and voted by the constituent assembly on Aug. 9 and 27; and both failed. In this extremity he moved (Sept. 24) that a tax amounting to the fourth part of all incomes should be levied, and the assembly granted it. This was the last financial measure he proposed. He vainly tried to oppose some of the revolutionary measures originating in the constituent assembly, such as the seizure of church property and the issuing of *assignats*. This made him unpopular, not only with the revolutionists, but with the majority of the deputies; while on the other hand he had lost the confidence of the king and of his colleagues. A new issue of *assignats* to the amount of 800,000,000 having been ordered by the assembly (Sept. 4, 1790), he resigned and started for Switzerland. On the roads where a year previous he had been welcomed as the saviour of France, he was in-

sulted, threatened, and even arrested; an order from the assembly was necessary to procure his release. He retired to his estate of Coppet, near Geneva, where he wrote a vindication of his conduct, *De l'administration de M. Necker, par lui-même* (1791). In 1792 he published *Réflexions offertes à la nation française en faveur de Louis XVI.*, which had no other result than to cause him to be placed upon the list of *émigrés*. In 1796 he published an essay, *De la révolution française*, in which he severely censured the directorial government. After the accession of Bonaparte to power, Necker dreamed of the possibility of becoming his minister of finance; but in an interview he was coldly if not disdainfully treated. In consequence he published (1802) *Dernières vues de politique et de finances*, directed against the consular government. Among his miscellaneous writings are: *Le bonheur des sots* and *Fragments sur quelques usages de la société française* in 1786, both humorous; *Du pouvoir exécutif dans les grands états*, a political essay (1791); and *Cours de morale religieuse* (1800). His *Œuvres complètes* (17 vols. 8vo) appeared at Paris in 1822. **II. Susanne Curchod de Nasse**, wife of the preceding, born in Geneva in 1739, died at Coppet in May, 1794. She belonged to a French Protestant family, who on the repeal of the edict of Nantes took refuge in Switzerland. Her father, a clergyman, gave special attention to her education; and she was early noticed for her solid and versatile knowledge no less than her beauty and virtue. The historian Gibbon sought her in marriage, but desisted in consequence of his father's opposition. Having married Necker in 1764, she accompanied him to Paris, where her house soon became the resort of most of the distinguished writers of the time. Buffon, Saint-Lambert, Marmontel, and Thomas were among her most frequent guests; and in this society she educated her daughter, the celebrated Mme. de Staël. She was much occupied with acts of benevolence, and was the founder of the hospital which bears her name (1778). In 1794 she published her *Réflexions sur le divorce*, an elaborate plea for the indissolubility of marriage. A selection from her writings (*Mélanges*) was published by her husband after her death in 5 vols. 8vo.

NECROMANCY (Gr. νεκρομαντεία, from νεκρός, dead, and μαντεία, divination), the art of obtaining knowledge of future events by consulting the spirits of the dead. From the treatise of Tertullian *De Anima* it appears that the common practice of necromancy in his day consisted in eliciting an oracular response from a dead body. It is generally thought, however, that the term necromancy anciently designated the evocation of departed spirits, and "necyomancy" (Gr. νεκυομαντεία, from νέκυς, a corpse, and μαντεία) a descent into the abode of the dead. This latter form of divination is a favorite one with epic and dramatic poets of every period; but no trace of it exists outside

of their fictions. On the other hand, necromancy or the calling up of the dead appears to have been a practice and a profession from the earliest historical times. In Greece the necromanteum (*νεκρομαντεῖον*) was a place consecrated to the performance of necromantic rites. There were several such places, as the cave of Trophonius in Boeotia, the banks of the Acheron in Epirus inhabited by the Thesprotians, various localities in Thessaly, Hierapolis in Phrygia, and wherever the Cabiric associations prevailed in the East or West, Heraclea on the Propontis, and the shores of Lake Avernus in southern Italy. It has been conjectured, from Deut. xviii. 10, 11, that there were also many in Palestine and the neighboring countries, while Endor is indicated in 1 Sam. xxviii.—The most ancient Greek poets devote to necyomancy or the descent into Hades some of their most remarkable compositions, thence called *νεκυσίαι*, their counterparts being termed *νόστοι*, "returns." Homer, Hesiod, Æschylus, Euripides, Aristophanes, and Lucian among the Greeks, and Virgil and Seneca among the Romans, employ necyomancy as a principal part of their machinery, and some of them devote whole poems exclusively to it. Horace in satire 8, book i., and Lucan in his *Pharsalia*, describe forms of evocation. The calling up of Samuel by the witch of Endor, and of Melissa, queen of Corinth, at the instance of her husband Periander, are the first instances of necromancy mentioned in history. It is commonly admitted that its practice was frequent in all known countries at the dawn of Christianity. Tertullian, in the treatise mentioned above, discusses in the light of Christian revelation the prevailing pagan practice of necromancy and the belief underlying it. He speaks of dead bodies reanimated by demons and delivering oracles through the magic arts of sorcerers, as well as of the evocation of departed spirits. This demoniac agency, he contends, was employed by the Egyptian magicians, Simon Magus and Elymas, to deceive the multitude; and he maintains that this same agency was employed by the witch of Endor. He concludes by asserting that it is the exclusive prerogative of the Creator to recall the departed soul to its body; and that similar prodigies performed by demons are mere illusions. Necromantic practices were forbidden under severe penalties by Constantine; and, as forming a part of the magic art, they had been rigorously proscribed under the republic and the pagan emperors. They were half encouraged and half censured by Julian the Apostate, who reproached the sick Christians with sleeping near the monuments of the martyrs in the hope of having a remedy for their ills revealed to them. The professional necromancers (*ψευχαγωγοί*) continued to be proscribed by the successors of Julian, as well as by the canons of the western and oriental churches. Of the practice of necyomancy among the pagan northern nations, we have one striking indication in the Sæmun-

dic Edda, in which is narrated the descent of Odin to the Scandinavian hell in order to consult the prophetess Angarbodir.—In the practice of necromancy, founded as it is in the belief of a future life in which the departed spirits preserve their identity and associate with each other, while holding a certain communion with their living kindred on earth, certain ritualistic forms have been handed down from age to age with slight or no substantial variation. The poetic forms of the necromantic ritual, reflecting more or less truly the national belief of the writers, are to be found in the Odyssey of Homer, books x. and xi., the "Frogs" of Aristophanes, the "Persæ" of Æschylus, the "Menippus" or "Necyomanteia" of Lucian, and from Virgil, Lucan, and Horace as above quoted. It is said that colleges of the necromantic art existed in Spain throughout the middle ages and as late as the 16th century; but absolutely nothing deserving to be considered as fact can be gathered from contemporary authors. The reports made to the inquisitorial courts, or said to be gathered from their archives, are found upon close examination to be unworthy of serious belief. That necromantic and other magical practices always existed in some localities in every Christian land, is probable; but that the rites, forms, and incantations attributed to necromancers, and printed in various compilations, are genuine, cannot be regarded as proved.

NECROSIS (Gr. *νέκρωσις*, from *νεκρῶν*, to cause to die), a term employed to denote the death or mortification of bony tissue. It bears the same relation to the bones that gangrene does to the soft parts; the part of the bone affected with necrosis becoming a foreign body, like the eschar in gangrene, which, by the efforts of nature or of art, must be removed. Necrosis is the result of inflammation of bone (ostitis), caused by injury or arrest of nutrition; it frequently follows ill-treated or badly performed amputations, and is more apt to occur in scrofulous and debilitated subjects. (See AMPUTATION.) Inflammation of bone does not, however, always end in necrosis; for resolution may take place, or superficial suppuration. The bones of the lower extremity, particularly the femur and tibia, are those most frequently attacked, although persons engaged in making lucifer matches, or otherwise exposed to the fumes of phosphorus, often have necrosis of the jaw bones. (See MATCH.) Necrosis may be traumatic (from mechanical injury) or ideopathic (without immediate exciting cause); and the inflammation from which it arises may be either acute or chronic. The progress of the necrosis itself (that is, the separation of bone) is more or less slow. The extent varies; sometimes a mere leaf of bone may perish on the external surface, a process termed exfoliation; or a large exterior section or the cancellated interior may perish. (See BONE.) The dead portion is called a *sequestrum*, its position depending upon whether the ne-

crosis is external, from periostitis, or internal, from endostitis. (See OSTEO-MYELITIS.) Necrosis usually attacks the laminated structure of the shaft rather than the cancellated or spongy portion, this being more liable to caries. (See CARIES.) By avoiding the articular extremities, therefore, necrosis is not apt to be complicated with synovial inflammation, but it occasionally attacks the head of the tibia. Its progress may be divided into two stages, the inflammatory stage and the stage of separation, the latter taking place when the inflammation reaches the point of suppuration. When the necrosis is external to the shaft, the periosteum, when not destroyed, generally secretes a shell of bone outside of the dead part, and through holes in this the pus passes out. When the inflammation is in the membrane of the canal, or endosteum, and is followed by necrosis, the sequestrum will be surrounded by a shell of the true shaft.—The symptoms of necrosis are those of inflammation of bone in general, attended by other distinguishing physical signs, such as whiteness of the exposed bone, resonance on being struck, and absence of hæmorrhage if scratched. If, however, the bone retains its vitality, the color is brown, it is covered with a secretion of its own, and it bleeds when scratched. The treatment is both expectant and active. Time, pain, and much suffering may be saved by an early and free incision into the diseased part. The detachment of the sequestrum must be left entirely to nature, or assisted only by constitutional treatment, such as leeches, fomentations, and other local antiphlogistic, but often general tonic treatment, great attention being paid to supporting the strength. When the sequestrum has become wholly detached from the living bone, nature should be assisted in its removal by art. There is error in waiting too long, as the irritation of the dead part may induce too much structural change; but there is greater danger in interfering too soon, before the piece of bone becomes loose. When a careful examination has indicated the proper time, an incision is made through the superficial soft parts; then, through the cloacæ in the exterior shell of bone formed by the periosteum, the form and position of the sequestrum may be ascertained with a probe. If necessary the exterior shell must be divided by cutting pliers, and an opening sufficiently large made to admit of extraction by the forceps, which must be carefully and gently done. Amputation is sometimes required.

NECTAR, in Greek and Roman mythology, the beverage of the gods, imparting health, vigor, youth, and beauty to all who drank it. It is described as a red wine, which like that of mortals was drunk mixed with water. It was served at the banquets of the immortals by Hebe or Ganymede. According to a few ancient writers it was the same as ambrosia, being not the drink but the food of the gods. In the Iliad, Thetis is represented as preserving

the body of Patroclus from decay by anointing it with both ambrosia and nectar.

NECTARINE (Ital. *nettarino*). When the nectarine was introduced into cultivation, or whether it was known to the ancients, is not ascertained. It is simply a peach with a smooth skin (see PEACH), and nectarines have been raised from peach stones and *vice versa*. As early as 1741 Peter Collinson, in his correspondence with Linnæus, cited the case of a peach tree producing nectarines, an occurrence which has frequently been noticed in this country as well as in Europe; and one instance is recorded in which a nectarine tree at first bore fruit half nectarine and half peach, and subsequently bore a perfect peach. The Boston nectarine, one of the esteemed varieties, is known to have been raised from a peach stone. As with peaches, there are free-stone and cling-stone nectarines. In quality the nectarine is not so rich as the best peaches, but its flavor is distinct, and frequently strongly marked with the bitter-almond or prussic-acid flavor; but no fruit exceeds it in beauty, the wax-like skin being often of the richest shades of yellow and carmine. Something over 30 varieties are in the fruit catalogues, differing in size, color, time of ripening, &c. The Elruge and Violette Hative are the varieties most generally cultivated, the popularity of the latter being shown by its having about 15 synonyms. So far as climate is concerned, the nectarine will succeed wherever the peach will, but it is much less seen in our gardens than formerly on account of the destruction of the fruit by the curculio; its smooth shining skin seems to offer an especially tempting place for the female curculio to deposit her eggs; by systematic jarring of the trees, as practised with the plum, a good share of the fruit might be saved. Under glass the nectarine reaches great perfection, and there are few finer sights in horticulture than a nectarine house in full bearing, at the time the fruit is ripening.

NECTARY (*nectarium*), the term applied by Linnæus to the parts of the flower in which nectar or honey is secreted. It was afterward used for any anomalous appendage to the flower, or for any unusual development of its parts, such as the spurs of the calyx in columbine and the curiously modified petals of the acornites; it was also given to the cup which surrounds the stamens in *narcissus*, to various disks and glands of the flower, and in fact to all parts of the flower not properly referred to calyx, corolla, stamens, and pistils. Having become such an indefinite term, being applied to bodies of widely different nature and without regard to whether they secreted honey or not, it has of late years been dropped by the best authors, and may be regarded as obsolete.

NEJDJED, or *Nejd*, a country of central Arabia, the dominion of the sultan of the Wahabees, between lat. 19° 20' and 29° 30' N., and lon. 40° 10' and 50° 20' E., bounded N. by Shomer, E. by the Persian gulf, W. by Hedjaz, and S.

by the Dahna or great sandy desert; pop. in 1862, according to Palgrave, 1,219,000. The country is divided into 11 provinces, and the population is distributed in 316 towns or villages. Nedjed is traversed from N. E. to S. W. by a range of mountains called Jebel Toweik, whose general form is that of a crescent. It is a wide and flat chain, or rather plateau, with an elevation of from 1,000 to 2,000 ft. above the surrounding country, or about 3,000 ft. above the sea. The extreme verge is generally abrupt, the chalky cliffs rising from the plain 500 or 600 ft. Then succeeds a table land, nearly level; then another steppe of 300 or 400 ft., followed by a second table land; and occasionally a third and loftier one crowns the whole. The entire plateau is intersected by numerous valleys of various breadth and length, but nearly all of which are bordered with steep and sometimes precipitous banks. The plateaus are for the most part clothed with fine pasture, which lasts throughout the year; but the greater the elevation, the less is the fertility and the drier the soil. Trees, solitary or in groups, are common. Little water is to be found, the torrents that pour down the cliffs in winter being soon absorbed. In the valleys the underground supply is constant and copious. Jebel Toweik is of calcareous formation, and not granitic like the mountains of Shomer, although in the south-east peaks of granite are intermixed sometimes with the limestone rock. Iron ore is found in the W. part of the range. The soil of the valleys is light, a combination of marl, sand, and little pebbles washed down from the heights. In these valleys are concentrated the fertility and the population of central Nedjed. The climate of the N. part of the range, where the mountains are the highest, particularly in the province of Sedeyr, is as healthy as any in the world, and the inhabitants are remarkable for their ruddy complexions and well developed forms. The principal towns of this province are Atalah and Toweym, the latter having 12,000 inhabitants. West of Sedeyr lies Woshem, the chief town of which is Shakra; and S. of it are Aared and Yemamah, in the former of which is Riyad, the capital of Nedjed. Throughout this central region there is abundant pasture, and the sheep, camels, horses, and cattle excel those in other parts of Arabia. There is a broad-tailed breed of sheep, yielding good mutton and remarkably fine wool. Camels abound, and dromedaries are more frequently seen than in Shomer. Cows and oxen are common, of a prevailing dun color, small-limbed, and having a hump like the cattle of India. The horses are the perfection of the Arab breed, but are not common, for none but chiefs or men of wealth and rank possess them. They are small, but of exquisite shape, and generally of chestnut or gray color. Wild boars and pigs are sometimes seen in the mountains, and gazelles are numerous. Game is abundant, especially of the feathered kind, such as par-

tridges, quails, and pigeons, but is seldom hunted. There are no venomous insects, and flies are almost unknown.—On the N. boundary of Nedjed, on the borders of Shomer, is the province of Kasim, separated from central Nedjed by a *nefood* or sand pass, stretching from N. E. to S. W., and almost impassable in the hot months. Kasim is a large plain, about 60 m. in width and twice as much or more in length, studded with towns and villages, towers and groves. Besides four or five large towns and more than 50 villages, its surface is strewn with smaller hamlets and isolated wells and gardens, connected with each other by a maze of paths and tracks. From here to Jebel Toweik extends a series of high watch towers, that afford the means of discerning the approach of invasion. The soil, a red or yellow sand, gives little promise to the eye, but wherever irrigated produces a rich vegetation. Water is abundant. The date palm is the staple article of cultivation, but the peach, apricot, fig, and grape are also raised. Cotton grows well, but none is raised for export. An important commerce was once carried on between Kasim and Damascus, but it has ceased to exist under Wahabee rule. The principal walled towns of Kasim are Bereyдах (pop. 25,000), and Oneysa (30,000). Hasa, another province of Nedjed, lies on the Persian gulf. Its N. part constitutes the province of Katif, but the two are considered as one district by the government. The chief town is Hofhuf. Katif, the principal seaport of Nedjed, about 80 m. N. by E. of Hofhuf, was once a place of considerable commerce, but the neighboring island of Bahrein, in the dominions of the sultan of Oman, has absorbed most of its trade. The vegetation of Hasa differs in many respects from that of central Nedjed. The date palm still predominates, but the *nabak*, a mere bush inland, becomes here a stately tree. Indigo is cultivated, and cotton is more widely grown than in Yemamah or Kasim; rice fields abound, and the sugar cane is raised. Almost all the leguminous plants and the cereals, barley excepted, grow to perfection, and under a different government could be raised with profit; but heavy taxes and arbitrary contributions have ruined agriculture. Hasa was once noted for its manufactures. Its cloths of silk and wool mixture, of a delicacy of work and elegance of pattern unknown elsewhere save in Cashmere, and its embroidered cloaks of brilliant colors, bordered with gold and silver threads, were famed in the eastern world. Its artisans in the precious metals, copper, and brass were unrivalled. But Wahabee fanaticism and proscription of all luxuries has cut off these branches of labor, which once supplied an important commerce. The climate of the coast is not so healthy as that inland, and the people are more sallow in complexion, and have less physical activity. A large part of the remainder of Nedjed is a desert interspersed with occasional oases. The great pilgrim routes from Persia to the holy

cities lie across Nedjed; the more northerly one, to Medina, through the province of Kasim, that to Mecca along the N. base of Jebel Toweik. The caravans are made to pay exorbitant tribute, for the Persians and all others who are not strict Wahabees are regarded as heretics whom it is right to despoil.—Nedjed contains two diverse elements in its population, those who are strict Wahabees in faith and those who are Wahabees by subjection only. The former class predominates in the provinces of Aared, Woshem, Sedeyr, Aflaj, Dowasir, and Yemamah. In the other provinces there is not much attachment to the reigning dynasty, and the people are unsettled in their opinions. Hasa, Katif, and Kasim are subject to Nedjed only because they are unable to free themselves, the majority of the people being Mohammedans, but not Wahabees. The government is a pure despotism. The military muster of the sultanate is about 50,000 men. Two or three miserable vessels at Katif constitute the navy. The annual revenue is estimated by Palgrave at about £100,000, with a nearly equal income from extraordinary contributions, fines, spoils of war, &c.—For the earlier history of Nedjed see WAHABEES. In 1834 Turkey, the sultan of Nedjed, who was actively engaged in reconstructing his kingdom, ruined by the Egyptian invasion, was assassinated by his cousin Mashary, who usurped the throne. Faisul, Turkey's son, returned at once from Hasa, where he had been besieging Hofuf, slew Mashary, and assumed the sovereignty. The Egyptians again overran Nedjed in 1838, and Faisul surrendered to their commander; but in 1843 he returned to Riyad and reestablished himself as the legitimate head of the Wahabees. He died in 1865, and was succeeded by his son Abdallah, against whom his younger brother Turkey successfully revolted. Abdallah, expelled, sought aid from the Sublime Porte, which sent an armed force and in 1874 took possession of Hasa on the east, while on the west another body of troops occupied Lahe, but with what result so far as Nedjed is concerned is not now (February, 1875) known.—See Palgrave's "Journey through Central and Eastern Arabia" (London, 1865), and Pelly's "Visit to the Wahabee Capital," in the "Journal of the London Geographical Society" (1865).

NEEDLE, a slender steel instrument, pointed at one end and with an eye at the other, used for carrying the thread in sewing. Among uncivilized people, at a very early period, rude attempts were made to form needles or bodkins of bone and ivory, by means of which their garments might be stitched together; but among the more refined nations of antiquity, as the Chinese, Hindoos, Egyptians, Assyrians, and Hebrews, fine needles must have been in common use. Pliny mentions needles of bronze for sewing and knitting as being in use in his day, and bronze needles of large size have been found in Egyptian tombs, which must have been made 4,000 years ago. Fine needles could

not of course resist the consuming action of air and moisture for so great a length of time. The Spanish or steel needle was introduced into England in the time of Queen Elizabeth; but the process by which it was made was kept secret, and the art was unknown till the year 1650, when it was revived by Christopher Greening at Long Creden in Buckinghamshire. Great improvements have since been introduced in needle making; and the "fine steel needles" of that period bear but a faint resemblance to the delicate and highly tempered needles of the present time. The manufacture of needles is now carried on to a great extent in many villages in England, but principally at Redditch, about 12 m. from Birmingham, and from this obscure place a large portion of Europe, the British colonies, and the United States are supplied. They are also made at Aix-la-Chapelle and its suburb Bortette, the latter place being the principal seat of the manufacture on the continent.—Though extremely simple in its form and appearance, the needle requires many operations for its construction, passing through the hands of nearly 100 workmen. The wires of various sizes being furnished in coils to the needle maker, he selects such as are of equal diameter and clips them into pieces, each of the length of two needles, with large shears, which are fastened to the wall of the cutting room. After being straightened, they are pointed by applying them to small, rapidly revolving grindstones. The wires being pointed at both ends, the centre of each is flattened, and a groove is formed on either side, with a small indentation at the spot where the eye of the needle is to be made, which operation is performed by means of a stamping machine. A bed of iron which contains the under half of the die or stamp is supported on a heavy stone, the upper half being attached to the bottom of a hammer, of about 12 lbs. weight, which is raised with the foot by means of a lever. The wires are dropped, one at a time, upon the iron bed, and the hammer is made to fall upon them with a sharp blow. The raised faces of the stamp produce indentations on the opposite sides of the wire; and though the operator adjusts each piece separately, yet he can stamp 2,000 wires or 4,000 needles in an hour. The work of eyeing the needles is performed by boys, who use small hand presses for the purpose. The lengths are next separated between the eyes by bending the lines of needles backward and forward. The points then being held firmly in a hand vice, the heads are filed to their proper shape. This completes the soft work, as it is called. The next process is hardening. The needles are now in a black, soft, dingy state; and in order to harden them they are placed on iron plates and brought to a red heat, when they are plunged into cold oil, after which they are again heated to a less temperature and more gradually cooled. The scouring or clean-

ing is accomplished by laying the needles in heaps upon pieces of canvas, scattering them upon a quantity of soft soap, emery, and oil, and rolling them into bundles, which are closely wound with twine. Each bundle is from 2 to 3 ft. long and from 3 to 4 in. thick. These are placed in a scouring machine, which resembles a common mangle, and rolled backward and forward for 50 or 60 hours. The scouring and cleaning is continued for the best needles seven or eight days. When taken out of the canvas they are laid on tin plates, and a little girl is employed to place the heads all one way. This is done simply by wrapping a piece of wash leather around the fore finger, and pressing it against one end of the pile of needles, thus catching all the points which lie in that direction. All the imperfect needles are then removed, the remainder are placed in rows upon metal plates with the eyes projecting over the edge, and a red-hot iron plate is brought sufficiently near to produce a dark blue film upon the heads, which indicates a proper temper. The very delicate operation of drilling, or removing the jagged portions from the interior of the eye, follows. This is performed by a woman who has before her a three-sided steel drill, revolving rapidly. Taking the needles in her hand and arranging them in the form of a fan, she brings them successively under the action of the drill, first on one side and then on the other, after beveling off the sharp edge of the eye where it communicates with the groove, which is called counter-sinking. The drilling of the eye is a modern improvement, and requires a very steady hand. The points are finished upon a small rotating stone, and then polished on a wheel covered with buff leather, slightly coated with polishing paste. Lastly they are counted into quarters of hundreds, folded in colored papers, and labelled. For exportation these are made up into packets containing from 20,000 to 60,000 each. The processes above described apply only to the finer sorts of needles. In the heavier kinds, such as harness, upholsterers', sail, mattress, and bookbinding needles, many of these operations are omitted. The French needles are generally made of iron wire which is converted in the course of the process by cementation into steel. The manufacture by this method is less difficult, but the needles are decidedly inferior to the English.

NEEDLES, The, a cluster of five pyramidal rocks in the English channel, lying off the W. extremity of the isle of Wight. They are composed of thick strata of chalk alternating with very thin strata of black flint. The waves are continually producing changes in their form, and only three of the pyramids now stand prominently out of the water. In 1764 the principal one, which was 120 ft. high, fell down, and almost entirely disappeared.

NEEF, or Neefs, Pieter, the elder, a painter of the Flemish school, born in Antwerp about 1570, died in 1651. He was a pupil of Hendrik

Steenwyck the elder, and like him was distinguished for his excellence in perspective and architectural views. He painted principally the interiors of churches and temples. Many of these views are represented by torchlight. As he was deficient in the designing of figures, he often employed the Francks, Van Thulden, Jan Breughel, or Teniers to paint them; and his pictures decorated by the two last are very valuable.

NEELE, Henry, an English author, born in London, Jan. 29, 1798, committed suicide in a fit of insanity, Feb. 7, 1828. He was the son of an engraver in the Strand, and in early life was articled to an attorney. He published "Odes and other Poems" (1817), "Dramatic and Miscellaneous Poetry" (1823), and "Romance of English History" (1827). In 1827 he delivered a series of lectures on English poetry from Chaucer to Cowper, which were published after his death, under the title of "Literary Remains;" and a volume of "Tales" and other miscellaneous pieces in prose and verse was published in 1830.

NEES VON ESENBECK, Christian Gottfried Daniel, a German botanist, born near Erbach in the Odenwald, Feb. 14, 1776, died in Breslau, March 16, 1858. He was educated at the gymnasium of Darmstadt and the university of Jena, and after practising for a time as a physician was appointed in 1818 professor of botany at Erlangen, and subsequently was elected president of the Leopoldine academy of naturalists. In the same year he was appointed professor of botany in Bonn, where, with the help of his brother and of Sinning, the gardener of the botanic garden, he was the means of founding a new institution for the science. In 1830 he went to Breslau as professor of botany and director of the botanic garden. Shortly before the political commotions of 1848 he became an active member of the newly formed Breslau religious association called *Christkatholiken*, whose aim was to utilize the working power of the congregation by organizing among themselves associations for various benevolent purposes. In 1848 he went to Berlin, where he was active in the cause of democracy, and on his return founded at Breslau a society called the fraternity of laborers for the promotion of their education, domestic comfort, and business relations. The government ordered him to resign its presidency. He was soon afterward prosecuted for living with a woman without having been divorced from his third wife, and in 1851 he was suspended and in the following year deposed from his professorship. His prosecution was generally considered to be merely a pretext in order to interfere with his reformatory labors. He was also a believer in spiritualism, and some of his children were reported to be clairvoyants. For the support of his numerous family, he was obliged to sell his valuable library, and his herbarium, consisting of 80,000 specimens. One of the most distinguished of German botanists, he was hon-

ored with numerous dignities, and was elected a member of 77 learned societies. Goethe, in his "Metamorphosis of Plants," had advanced the theory that the various parts of the flower are all modifications of one common type, the leaf; and this theory Nees von Esenbeck demonstrated to be scientifically true in his *Handbuch der Botanik* (2 vols., Nuremberg, 1820-'21). Among his other botanical works are: *Die Algen des süßen Wassers* (Bamberg, 1814); *Das System der Pilze und Schwämme* (Würzburg, 1816); *Die Pflanzensubstanz*, written in conjunction with Bischof and Rothe (Erlangen, 1819); *Bryologia Germanica*, with 43 colored plates, in conjunction with Hornschuh and Sturm (2 vols., Nuremberg, 1823-'31); *Agrostologia Brasiliensis*, forming the first part of Martius's *Flora Brasiliensis* (Stuttgart, 1829), to which he appended a poem of 16 pages, entitled *De Saccharo Opificio Carmen*; *Enumeratio Plantarum Cryptogamicarum Javæ et Insularum adjacentium* (Breslau, 1830); *Genera et Species Asterearum* (Nuremberg, 1833); *Systema Laurinarum* (Berlin, 1836); *Floræ Africæ Australioris Illustrationes Monographiæ* (Glogau, 1841); and *Systema Hepaticarum*, in conjunction with Gottsche and Lindenberg (Hamburg, 1844-'7). In 1852 he published the first volume of a projected illustrated manual of universal natural history, entitled *Die allgemeine Formenlehre der Natur* (2d ed., Breslau, 1861). He early applied himself to the study of cryptogamous plants, in regard to which his researches were minute and extensive. His great work in this department is the *Naturgeschichte der europäischen Lebermoose*, also known under the title of *Erinnerungen aus dem Riesengebirge* (4 vols., Berlin and Breslau, 1833-'8). In the sphere of speculative thought he published *Die Naturphilosophie* (1841), which he intended as the first part of a "System of Speculative Philosophy."

NE EXEAT. The writ *ne exeat regno* in England, and *ne exeat republica* in the United States, is issued by the court of chancery to restrain a defendant in a pending suit from leaving the country. It is directed to the sheriff of the proper county, and commands the arrest of the defendant and his detention until he shall give security in a sum specified not to depart from the jurisdiction of the court without its permission. The writ is not allowed until after bill filed, nor without a showing under oath both of a good cause of action, and of a threat or design on the part of the defendant to go abroad, by means whereof the purpose of the action may be defeated. It is not often resorted to, and indeed since imprisonment for debt has been almost universally abolished there are only a few cases, such as those of fraud in fiduciary relations, and others standing on like reasons, in which the court could be justified in awarding it. From the foregoing statement that this remedy has become an unusual one should perhaps be excepted the state of New York, in which a

question seems to have been made whether the province of the writ is not extended by the abolition of distinctions between legal and equitable remedies. There is a conflict in the rulings of the courts whether the writ is not abolished by the code, but in the supreme court a very liberal use has of late been made of it.

NEFF, Félix, a Swiss missionary, born in Geneva, Oct. 8, 1798, died there, April 12, 1829. He entered the army, and reached the rank of sergeant, but left the service in 1819 to become a missionary in the valleys of the upper Alps. In 1821-'2 he visited the destitute districts of Grenoble and Mens in France; and in April, 1823, went to England, where he was ordained an Independent minister. He afterward resumed his labors in the Alpine glens, dedicating churches, organizing schools, and aiming incessantly to benefit the people; and the hardships to which he subjected himself finally destroyed his health. His life has been written by A. Bost (London, 1855).

NEGAUNEE, a city of Marquette co., Michigan, situated in the midst of the iron region, at the junction of the Marquette, Houghton, and Ontonagon railroad with the Peninsular division of the Chicago and Northwestern line, 12 m. W. by S. of Marquette; pop. in 1874, 3,741. On the south and west are large hills containing immense deposits of iron ore, and on the N. border is Teal lake, a beautiful body of water 2 m. long by $\frac{1}{2}$ m. wide. There are productive mines and several large blast furnaces within the city limits. Negaunee has a number of stores doing a large business with the surrounding mines, a national and two state banks, a weekly newspaper, good public schools, and three churches. Previous to 1865 it contained only a few cabins.

NEGLIGENCE, in law, primarily the want of care, caution, attention, diligence, skill, or discretion in the performance of an act by one having no positive intention to injure; and secondarily the omission to perform a duty imposed by law for the avoidance of injury to persons or property of others. In the civil law negligence is classed as slight, ordinary, and gross; the first being the want of great care and diligence, the second the want of ordinary care and diligence, and the last the want of even slight care and diligence. The propriety of this classification has often been denied by common law judges; but as the degree of care, caution, and diligence required of parties is different under different circumstances, so that the same want of caution and prudence which under one set of circumstances would render the parties chargeable with it liable as for negligence, would give no right of action under another, the classification is found useful as indicating the different degrees of diligence required by the law in different cases. Thus, if for the mere accommodation of my neighbor I loan to him the use of my horse, for which he is to make no compensation, it is reasonable that he should take the highest care of him,

and that he should respond to me for any damages occasioned by even a slight want of care and diligence; while, on the other hand, if I desire him to keep my horse for me a short time, without compensation and solely for my accommodation, it would be unreasonable to charge him with an obligation for the like extreme care, or to hold him responsible for anything short of serious and culpable neglect. If, however, the bailment is for the mutual accommodation and benefit of both parties, so that he has the use of the horse while I am compensated for it, the just rule would seem to be that he should take such care of the horse as a prudent man would of his own, and that anything short of this, resulting in injury, should be accounted actionable negligence. The rules on this subject have been explained to some extent in the article BAILMENT, and the liability of an employer for the negligence of his servant is stated in that on MASTER AND SERVANT. In general, any person guilty of negligence in the exercise of his rights, or failing in due time and manner or with due care to perform a duty, whereby another person sustains injury, is responsible to the party injured for the consequent damage. Thus, if an attorney undertakes the management of a suit, but neglects to file pleadings in due time, or to attend at the time fixed for trial, or to produce in evidence the documents in his possession proving his client's right, and his client loses his suit in consequence, the injured party by the proper action, counting on this negligence, may recover compensation for what he has suffered thereby; and if a railway company, owing a duty to the public to propel its trains with caution and prudence through a village or any thickly settled neighborhood, shall run them with great rapidity and without signals, by means whereof persons passing along the streets and themselves observing ordinary caution are struck by the train and injured, such persons may have redress in a like action. The chief qualification of this doctrine is that the party complaining of the injury must not himself have contributed to it by his own wrongful or wilful act, or by his own want of ordinary care; for if both parties were in fault, the common law will not attempt to apportion the culpability, but will leave each party where his own unwarrantable conduct or neglect has left him. In this regard the rule of the common law is different from that which prevails in admiralty in some cases, where the consequences of the concurring fault of two parties may be apportioned between them as near as shall be found practicable. The concurring fault or negligence, however, which at law will bar an action for redress, must be such as has contributed proximately to the injury. Thus, if one drives across a railroad track without looking to the right or left, and is struck by a passing engine, he can have no redress, because he failed of ordinary prudence in not looking to see whether a train

was near; but if, observing due care and prudence at that time, he is nevertheless injured, it will be no defence to the railway company that some want of proper caution may remotely have contributed to the accident. The rule of contributory negligence imputes to one who is under natural or legal guardianship the negligence of the guardian; so that a child run over in the street may not recover damages from the party accidentally running over him, if the parent who had charge of him was careless in permitting him thus to wander into a place of danger; and an insane person may not recover where the trustee negligently suffers him to be abroad. And this rule is applicable where one temporarily places himself in the hands or under the control of another; as where one takes a seat in the carriage of another and is carelessly driven by the latter into danger, the negligence of the driver will preclude recovery for accidental injuries. Corporations as well as natural persons are liable for negligence, and municipal corporations as well as others, with this restriction, that an exercise of their legislative authority is not imputable as negligence. But if the corporation order the construction of a public work, and the execution of the work is careless and imperfect, and injury results, an action will lie, provided it is constructed by the corporation itself through its own agents; but if the construction is let to an independent contractor, he alone can be looked to for redress for his negligence. Public officers are in general liable for their negligence, not only to parties on whose behalf they assume to perform a duty, but also to third persons injured by their action; but from this must be excepted the chief executive of the nation or state, any officers while acting in a legislative capacity, and judicial officers and others exercising a discretionary authority, and where the negligence is predicated of their discretionary acts. The owner of a vicious beast, knowing him to be such, is guilty of negligence if he suffers him to be at large without a keeper; but as his liability at the common law depends upon his knowledge of the vicious nature of the animal, which is not always easy of proof when it exists, it has been thought proper in some cases, especially as regards dogs, to pass statutes dispensing with this proof, and making the owner liable upon proof of the injury alone.—Where negligence results in the death of a human being, the common law gives no remedy; but this has been found a great hardship, which was remedied in England by statute in 1846, and the substance of this statute has been reenacted in the several states of the Union, the remedy being given to or for the benefit of the parent, husband, wife, child, or estate of the person killed. The killing of a person by wilful neglect or gross carelessness may be a felonious homicide; as where a mechanic throws rubbish from a roof into the streets of a village where people are constantly passing, with-

out looking to see if at the time it is clear; or where the engineer on a railway train drives it furiously through a town without sounding signals, or occupies the track in the time of an approaching train without taking steps to ascertain whether he may do so with safety. If in any of these cases death results from the negligence, the reckless and wanton conduct will stand for criminal intent; and in any case of a clear duty imposed by law, if death result from a neglect of the duty, it will be accounted criminal homicide. (See *HOMICIDE*, and *MANSLAUGHTER*.)—The legal aspects of negligence have recently been fully considered in the valuable treatises of Shearman and Redfield (New York), and Francis Wharton (Philadelphia).

NEGOTIABLE PAPER. In the article *EXCHANGE, BILL OF*, some of the general rules of the law of negotiable paper have been stated. In explanation of the central principle and foundation of this very peculiar system of law, we will briefly consider its origin and history. The earliest commerce must have been by barter, and therefore limited to the exchange of superfluities between neighbors. Then money was invented and used as the representative of all value and all property; and he who had anything to spare could exchange it for money, in which its value was vested, and this value could be retained by him who held it until he wished to exchange it for something he needed to use. It was an immense step thus to obtain a representative of all value; and the utility of it grew with the increasing commerce of the world, and was found adequate to the wants of this commerce until a few centuries ago, when the next step was taken, and something was found which is the representative of the representative of all value; and to this last invention the enormous increase of commerce since it came into use must be ascribed. As a bag of coin represented the value of 100 oxen, now a strip of paper represents the value of barrels of gold. But while the principal benefit of negotiable paper is due to the fact of this perfect representation of all value, there are two other utilities attached to it of almost equal importance. One of these is the facility it offers for paying distant debts without transfer of money or property, by making debts in one place pay debts in another, through the instrumentality of bills of exchange. The other is the method it offers of accumulating credit and employing the whole mass as money by means of successive indorsements. The origin of bills of exchange has been accounted for on various theories, each having perhaps some basis in truth; but when it has been stated that some six centuries ago they came into general use in Europe, little more can be said with certainty. Negotiable notes were not used until much later, and not until the statute of 3 and 4 Anne, ch. 9, which enacted that they should be "assignable and indorsable over in the same manner as inland

bills of exchange are or may be by the custom of merchants," was their negotiability fully recognized by the courts. In the article already referred to the chief incidents of negotiability were explained, namely: that when the paper is duly assigned the assignee is entitled to maintain suit upon it in his own name, and also may recover the sum promised to be paid by it notwithstanding there might have been defences to it in the hands of the assignor which would have precluded a recovery by him. Let us see, then, of what paper this quality of negotiability may be predicated. In the first place, independent of statute or of recent usages (which we shall refer to further on), it must be either a bill of exchange or a promissory note, which instruments are sufficiently explained under those heads. In the next place, if a bill of exchange, it must direct the person upon whom it is drawn to pay the sum of money therein specified to a person named (who is then called the payee), or to his order; and if a promissory note, it must promise to pay the sum specified to some person named or his order, or it may promise to make payment to the bearer, without naming any person whomsoever. In the case last mentioned the note is in contemplation of law payable to any one who may lawfully become the owner thereof, and it is assigned from hand to hand by mere delivery, and any person receiving delivery on a purchase thereof may enforce payment as bearer. With a bill or note payable to the order of a person named it is different. Before it has been assigned or negotiated only the payee can demand the money or bring suit; but the payee may assign it by writing his name upon the back, which is called an indorsement, and by delivering it to the intended assignee. There are several methods of making this indorsement, and one or another will be resorted to according to circumstances. If nothing more is written upon the back of the paper than the indorser's name, this is called a general indorsement, and it is equivalent in legal effect to a direction to the drawee or maker to pay the bill or note to the bearer thereof. The disadvantage of this is that in case the paper should be lost or stolen the finder or thief would have upon it the evidence of a *prima facie* right to receive and collect the money, and he or his assignee, under the rules laid down further on, might actually succeed in making collection to the exclusion of the real owner. To guard against such possible consequences, the payee in assigning may order the payment to be made to a person named, thus: "Pay A. B. or order;" and this being signed by him and delivered to A. B., who is thus made indorsee, the paper is payable to the indorsee only so long as he does not order it paid to any other person; but if he by a like indorsement shall order it paid to the order of another person named, the latter, until he shall give a similar order, becomes the only person entitled to demand and receive

payment. In this way the paper may pass through many hands, and be the instrument of many payments; and the owner for the time being will be always protected against the consequences of a loss of the instrument, because so long as he keeps it the indorsements will show that he alone has legal right to the money. In either of these forms of indorsement the indorser is held to undertake to make payment of the bill or note to the legal holder, provided the drawee or maker does not meet it when due, and the indorser is duly notified of the dishonor; and if there are several indorsers, the undertaking of each is the same. To avoid this, the indorsement may be without recourse; that is, the indorser in writing his name upon the paper may write over it "without recourse," or any other words indicating that he is not to be looked to for payment in any contingency. This does not affect the negotiability of the paper, but is only to shield the indorser from personal responsibility in case the drawee or maker fails to make payment. In order to understand the advantages to the holder of negotiable paper to be derived from this quality, the position of the holder may be compared with that of the assignee of other rights in action. Suppose, for instance, that one shall give his creditor a paper in these words: "Due A. B. five dollars, payable on the first day of January next," dated and signed by him; this paper is not negotiable, because it is payable only to A. B., and not to his order or to the bearer. If this paper is sold by the payee, and suit is brought upon it, this must be in the payee's name, as already stated. But it may be that when thus sued the maker will set up some defence to it, as that it was obtained by fraud, or without consideration, or that it has been paid; and such defence would be equally good against the paper in the assignee's hands as it would be were the payee still the owner. On the other hand, suppose the paper to be a promise to pay five dollars to A. B. or order on the first day of January after its date; in this case, if A. B. sells the note and indorses and delivers it, the assignee may not only sue upon it in his own name if it is not paid at maturity, but if it was indorsed to him before it fell due, and he paid value for it in good faith and without notice or knowledge of any defence to it, he may enforce payment regardless of any such defence, though it might have been one that was perfectly good as against the payee himself. In this respect negotiable paper is placed on the footing of money. If a man loses his watch, or is robbed of it, and the finder or robber sells it for value to an innocent purchaser, who sells it to another, and he to another, and so on, the owner can take it wherever he can find it, for no buyer acquires the slightest property in it against the owner. But if a man loses or is robbed of gold coins, and the finder or robber pays them away to an innocent party in the pur-

chase of goods, the owner loses his money. He cannot reclaim it unless by proof that the receiver of it knew when he took it that it belonged to some one other than the holder. Now this is precisely so in relation to promissory notes or bills of exchange, payable to order or to bearer. A familiar example may be found in bank notes, which are only promissory notes payable to bearer, and which stand exactly on the footing of coined money, in that any one receiving them innocently for value holds them against any original owner. If we require the reason for this doctrine, it is that negotiable paper may become the adequate instrument of business, as the word negotiable implies; and for this end, that it may represent money, and take the place of money, and possess in all the transactions of business all the immunities and privileges of money. If we understand clearly this principle and purpose of negotiable paper, or rather of the rules of law in relation to negotiable paper, we shall be able to understand those rules. It is for this purpose that all those rules aim at giving to negotiable paper the certainty of money; at making it tell its own story as money does; and, in a few words, at enabling every person who holds it to use it precisely as he would use money, with the additional advantage that he may by his indorsement add his own credit to that which the paper already holds.—The chief rules governing negotiable paper may be here stated. No especial form is necessary to either a bill or a note. The essential things are, a distinct promise, and sufficient certainty as to the payee, the payer, the amount, and the time of payment. The paper may be payable to any body or number of persons, if sufficiently designated, as "to the executors of A. B.," &c.; but if payable "to A. or B.," it is bad for want of certainty. It must be payable in money and not in property; and in England it has been decided that paper payable in bank of England notes was not negotiable, because such notes were not money. Similar decisions have been made in some of the states, while in others it is held otherwise if the paper is payable in what passes current as money at par. It is not to be inferred from what has been said that those only can be indorsers to whom or to whose order the paper has been made payable; any number of persons may indorse paper in order to charge themselves contingently with its payment under the rules given further on.—As soon as negotiable paper has been dishonored, or is over-due, it loses almost the whole of its peculiar character, and what may be called its privilege. The reason is the obvious one, that it is no longer capable of negotiation in the proper sense of the word; that is, it is no longer fit to be an instrument of business: in the first case, because it is already discredited, and cannot be considered the equivalent of money; and in the second, because there is no longer any time fixed when it can be paid or

converted into money. Hence it is now like paper not negotiable; that is, it may be sold or transferred as before, but the purchaser takes it now subject to the defence which could be made against it if it were still in the hands of the first party who transferred it after dishonor or after it fell due.—A bill of exchange should be presented for acceptance during the usual hours of business. The drawee may answer at once, or he may take a day for consideration; but if he does not accept before the end of the day after presentation, he refuses to accept. If not accepted absolutely, but upon some terms or conditions, the holder may assent to these, and then hold the acceptor; but he must treat it as no acceptance, and give notice accordingly in order to hold the drawer. When a bill is accepted it becomes like a note; and every bill and every note must be presented for payment, or in other words, payment of them must be demanded, and the demand must be such as the law requires, or all parties except the maker or acceptor are discharged. The paper must be so presented and demanded at maturity, by the holder or his authorized agent, of the acceptor or maker, on the very day on which it falls due, and in the usual and proper business hours of that day. Neither the bankruptcy, nor the insolvency, nor the absence, nor the death of the acceptor or maker is a sufficient excuse for not making the demand. For the insolvent may pay it, and if the payer is absent the demand must be made at his house or residence, or at his place of business; and if he is dead, it must be made of his executors or administrators. If the holder dies before the paper matures, and his executors or administrators are not appointed until after it matures, they must make the demand as soon after as they can; and if they make it without unreasonable delay, it is sufficient. Generally, when the demand cannot be made in the usual way at the time, the law permits it to be made within a reasonable time after the obstruction is removed. If the payer has absconded, or has no place of residence or business in the state, or is absent and cannot be found by diligent inquiry, demand is excused. But the same notice must be given of this non-demand as of non-payment; for the parties liable on the paper have not only a right to require demand upon all persons liable before them, but the further right to have notice given them if the paper is not paid. The purpose of this is to give them every opportunity of getting such security or indemnity as they can from the parties for whom they are to make payment. Once, the law said only that the notice must be given in a reasonable time; but now, all over the commercial world, the law itself defines this reasonable time. It requires that this notice be given on the day of non-acceptance or non-payment, or on the day immediately following. If the party en-

titled to notice lives at a distance, the notice should be given by mail, and must be put into the mail on the day of dishonor or the next day, if there be such a mail, and otherwise into the first mail that goes. A personal notice is, in general, good wherever given. And it should be personal, or in writing left at the residence or place of business, if the person giving the notice (as the notary or agent) lives in the same town or city with the party to whom it is given. He may send it even then by mail, but takes the risk of its reaching the party in season; but if it is sent out of town he may send it by mail, and this risk is not on the sender.—As the holder has one whole day to give his notice, so every one receiving notice has the same indulgence. Thus, if a note with six indorsers falls due, and the indorsee makes due demand of the maker, he must give notice of the non-payment to his indorser (who is the sixth) on the next day. That indorser has also until the next day to notify the fifth, and so on. Hence the first indorser will not get notice until the sixth day after non-payment; but now he will be held not only to his indorsee but to all persons below him, because he has had his due notice. No person, however, is entitled to the delay of more days than his own single day. Thus, if the indorsee of the sixth indorser notifies his indorser on the next day, he holds him; but if that indorser neglects to notify others, and the holder, learning this, on the third day notifies all the rest, all are discharged but the sixth indorser. Hence, it is usual for the holder not to take the risk of this, but to send notice himself to all the persons whose names are on the paper. (See NOTARY PUBLIC.) There is no precise form necessary for the notice. It should, however, state with sufficient distinctness what the paper is, its dishonor, and who the parties are, and the purport of the notice. After due demand and due notice have fixed the liability of parties, it remains in force, and there is no need of immediate suit. This right to demand and notice may be waived by any party entitled to it, and he may do this by any words of sufficient meaning; the usual way is by writing over his name when he indorses: "Waives demand and notice." It should be remembered that a waiver of notice is not a waiver of demand; although a waiver of demand is perhaps a waiver of notice.—The demand must be made when the note falls due, or, to use the common phrase, at its maturity. But this is not at the expiration of the time when the note is made payable on the face of it. The law adds three whole days, which are called days of grace. At first these were, as the name intimates, days of favor or mere indulgence; but usage, and now law, have converted them into an absolute right. In most of the states statutes provide that all negotiable paper, not payable at sight or on demand, is entitled to three days of grace, unless it be expressly agreed otherwise. This is sometimes

done, but not often; and the words used for this purpose are, simply, "without grace." One distinction is important. These days retain so much of their original character of mere indulgence, that if the last day of grace falls on Sunday, or on any holiday on which payment cannot be demanded, it is now due, and demand must be made, on the Saturday or other day preceding. But if paper without grace, or any payment not entitled to grace, falls due on Sunday, or any other legal holiday, the payer now gains a day, because payment cannot be demanded until Monday, or the day after the holiday. When and in what manner negotiable paper should be protested for non-payment, and how payment may be made *supra protest*, or for honor, will be stated in the article *PROTEST*.—It should be added, that of late years some other instruments besides bills of exchange and promissory notes have been treated by courts as negotiable paper. Exchange bills in England were so held; and then the bonds of foreign states, payable to the holder, were so considered. In the United States the same doctrine has been extended to state and municipal bonds payable to bearer and transferable by delivery; and also to similar bonds of private corporations and their coupons. In some states all demands are so far negotiable that assignees are permitted to sue thereon in their own names.

NEGRELLI, Aloys von, an Austrian engineer, born at Primiero, Tyrol, Jan. 23, 1799, died in Vienna, Oct. 1, 1858. From 1832 to 1840 he was employed in Switzerland, and constructed the first Swiss railway, from Zürich to the German frontier. Subsequently he was chief inspector of the Austrian northern railway till 1849, when he became general director of public works. He was at the head of all Austrian railways from 1855 to 1857, when about a year before his death the viceroy of Egypt placed him in charge of the works connected with the cutting of the isthmus of Suez.

NEGRITOS, natives of the Philippine islands, usually classed with Papuans. They in a measure represent the people called *negrillos* by Dr. Pickering in his "Races of Men" (1848), where he classes them as a subdivision of the Papuan race, and of the melanic or black family of mankind. They were formerly in possession of the entire group of islands, but are now found only in the mountainous districts of some of them, and especially in the northern portion of Luzon, where they inhabit also the coast from Palanan to Cabo Engano. (Semper, *Die Philippinen und ihre Bewohner*, Würzburg, 1869.) Fr. Müller in his *Allgemeine Ethnographie* (Vienna, 1873) classifies them among the Papuans of the pure type, while A. R. Wallace considers them a totally distinct race, and, connecting them with the inhabitants of the Andaman islands in the bay of Bengal, is of opinion that they are probably of Asiatic rather than Polynesian origin; and Peschel in his *Völkerkunde* (2d ed., Leipsic, 1875) prefers to

call them Asiatic Papuans, in distinction from Australian Papuans. In common with the latter, they have woolly hair and a flat nose, broad at the base. They are not black, but of

Negrito.

a dark copper color. The lips are somewhat puffed, and the jaws are slightly projecting. Virchow's measurements of some skulls have led to the supposition that their compressed form is of artificial origin. (See PAPUAN RACE AND LANGUAGES.)

NEGRO (Span. and Ital., from Lat. *niger*, black), a name properly applied to the races inhabiting the African continent, principally between lat. 10° N. and 20° S., and to their descendants in the old and new world. It does not include the northern Africans (like the Egyptians, Berbers, Abyssinians, Nubians, &c.), nor the Hottentots in the south, although in popular language, especially in the older writings, it comprises these and other dark-skinned

Negro.

nations, who are not characterized by the crisp hair of the true negro; in some of the border countries there has been considerable intermixture of negro blood and dialects. The

term negro, therefore, is not synonymous with African, and is not a national appellation, but denotes an ideal type distinguished by certain physical characters, such as are seen in the people of the coast of Guinea, viz.: black skin, woolly hair, flat nose, thick everted lips, and a prognathous form of the skull. Negroes occupy about one half of Africa, excluding the northern and southern extremities, but including its most fertile portions. Out of Africa, they are found in various parts of Asia and its islands, and throughout America and the West Indies, whither they were originally carried chiefly as slaves (see SLAVERY); they are rare in Europe. They were nearly unknown to the Hebrews and the Homeric Greeks; the Egyptians, however, about 2300 B. C., became acquainted with negroes through the conquests of their rulers, and represented them on their monuments as early as 1600; for nearly 35 centuries the type has remained unchanged in Egypt. The Greeks first knew them in the 7th century B. C., their Ethiopians being merely any people darker than the Hellenic, like the Arabs, Egyptians, Libyans, or Carthaginians, none of which are negroes. The typical negroes of the Guinea coasts are generally rude and nearly naked savages, of a deep black color and ugly features; in the interior, many of the tribes, like the Fan and others visited since 1855 by Paul Du Chaillu and Winwood Reade, are fierce cannibals, but fine-looking, warlike, ingenious, and skilful in the working of iron. Those on the Slave coast are the most degraded, selling their neighbors to slave dealers. In the vast regions explored by Livingstone, Barth, Du Chaillu, Burton, Speke, Baker, Schweinfurth, and other recent travellers, there are many tribes more or less savage, for an account of which the reader is referred to the respective special notices in this work, and chiefly to the narratives of these explorers. The Caffres of South Africa may also be classed among negroes, as well as the fine and ferocious races of Mozambique and the E. coast of Africa.—The skin of the negro is soft and silky, dull cherry red in the infant and growing black very soon; it differs from that of the whites principally in the greater amount of pigment cells in the *rete Malpighii* (the epidermis being uncolored), and in the greater number of cutaneous glands. The hair, though called wool, does not present the characters of the latter, especially the imbricated projecting scales, and differs but little from that of the other races except in color and in its curled and twisted form; it is harsh and wiry, and, according to some microscopists, more or less flattened, grooved longitudinally, lying perpendicularly in the dermis and piercing the cuticle in this direction, the coloring matter being diffused throughout its substance, and in a few instances so imbricated as to be capable of felting like wool. The skull is long and narrow, with a depressed forehead, prominent

occiput and jaws, a facial angle of 70° to 65°, and an internal capacity of about 82 cubic inches; a peculiarity of some negro crania, though by no means constant, is that the sphenoid does not reach the parietal bones, the coronal suture joining the margin of the temporals; the skull is very thick and solid, as would be indicated by the negro's favorite mode of fighting, both sexes butting like rams, and so flat that burdens are easily carried upon it. The stature of the negro is seldom 6 ft., and rarely below 5½; some of their figures are fine, especially the *torso*, and have been taken by Chantrey and other sculptors as models; in the female the development is so rapid that it is common to see childhood's natural grace combined with the prominent characteristics of maturity. Seen from behind, the spine usually appears depressed, owing to the greater curvature of the ribs; the nates are more flattened than in other races, and join the thighs almost at a right angle instead of a curve. Besides the characters already mentioned, may be noticed the projecting upper edge of the orbit; broad retreating chin; great development of lower part of face; small eyes, in which but little of the yellowish white ball is seen; small, thick ears, standing off from the head, with a small lobe and a general stunted look; black iris; very wide zygomatic arches, giving large space for the muscles of the lower jaw; large and transverse opening of the nasal cavity. The pelvis is long and narrow, its average circumference being from 26 to 28 in. instead of 30 to 36 as in the whites; this shape in the female, according to Vrolik and Weber, corresponds to the characteristic shape of the negro head; those writers consider it a type of degradation, as it approaches that of the *quadrumanus* in the more vertical direction of the iliac bones and their less width, in the smaller breadth of sacrum, and in the consequent less extent of the hips. The bones of the leg are bent forward and outward, the tibia and fibula being more convex than in Europeans; the calves are very high; the feet and hands are flatter; the heel bone, instead of being arched, is continued in a straight line with the other bones of the foot, causing it to project more behind; in consequence of the longer lever thus obtained, less muscular force is necessary in the movements of the feet, and the muscles of the calf are consequently less developed; the shoulder blades are shorter and broader; the muscles have shorter bellies and longer tendons, as is very evident in the legs and arms. Negroes have less nervous sensibility than the whites, and are not subject to nervous affections; they are comparatively insensible to pain, bearing severe surgical operations well; the effects of opium and other narcotics appear rather in the digestive, circulatory, and respiratory functions, than in the cerebral and nervous system; they are little subject to yellow fever, and more to yaws and other cutaneous affections; they are generally

very torpid under disease. They seldom have a fetid breath, but transpire much excrementitious matter by means of the glands of the skin; there is also much oily matter in the skin. The negro flourishes under the fiercest heats and unhealthy dampness of the tropics, withstanding the virulent endemics and epidemics of the country where the white man soon dies; and the race does not diminish, like the aboriginal American, in contact with civilization. The senses are acute; the voice in the males is hoarse and not powerful, and in the females high and shrill. Albinoes are not uncommon among negro races in all countries. Negroes produce with the white and other races a hybrid race, fertile for a few generations; but, unless mixed with the original stock, tending to extermination by disease and sterility. The offspring of a negro and white is called a mulatto; of a mulatto and white, a quadroon; a greater intermixture of white blood than this can with difficulty be distinguished by the ordinary observer from a dark-skinned white.—The African negroes display considerable ingenuity in the manufacture of weapons, in the working of iron, in the weaving of mats, cloth, and baskets from dyed grasses, in the dressing of skins of animals, in the structure of their huts and household utensils, and in the various implements and objects of use in a barbarous state of society. Their religion consists in the worship of idols and fetiches, representing a supreme power which they all acknowledge; they believe in good and evil spirits, in witchcraft, charms and spells, omens, lucky and unlucky days, &c.; they make fetiches of serpents, elephants' teeth, and many similar objects, and reverence wooden images and sacred things, which they think have received a peculiar power from their divinities to drive away evil spirits, and protect them from danger, disease, and witchcraft. They make prayers and offerings to their idols, and have sacred songs, festivals, dances, ceremonies, and places; they sacrifice animals and sometimes human victims, especially during obsequies; they have priests and holy men, who are also magicians and doctors. They believe generally in an after life, without any distinct idea of retribution, and some tribes in the transmigration of the human soul into a gorilla, or other beast, bird, reptile, or fish; they have great fear of ghosts and apparitions; they become ready converts to foreign religions, whether Islamism, Catholicism, or Protestantism. Being very fond of music, they have many ingeniously contrived musical instruments, generally of a noisy character; they have a keen sense of the ridiculous, and are of a cheerful disposition; though cruel to their enemies and prisoners, and setting little value on human life, they are naturally kind-hearted, hospitable to strangers, and communicative of their joys and sorrows; the females are remarkably affectionate as mothers and children, and as attendants on the sick, even to foreign-

ers. They are less dirty in their persons and dwellings than most other barbarous races. They are ready to receive instruction, and to profit by it up to a certain point; quick to perceive the beauty of goodness, they generally appreciate the services of the missionaries in their behalf, and were not their teachings counteracted by the intoxicating drinks brought by traders, they would probably in time, in outward observances if not in reality, merit the name of semi-Christian communities.—For negro languages, see AFRICA, LANGUAGES OF, and articles on the more important tribes.

NEGRO, Rio. See RIO NEGRO.

NEGROPONT. See EUBÆA.

NEHEMIAH, a Jewish governor of Judea under the Persians, and cup-bearer to King Artaxerxes Longimanus. He was the son of Hakaliah, received the surname or title of Tirshatha, and is the author of at least a portion of the Scriptural book which bears his name, a continuation of the historical book of Ezra. It gives the most important events in the life of Nehemiah, very full accounts of the rebuilding of the gates and walls of Jerusalem, statistical information on the increase of the people, and lists of priests and Levites. The authorship of chapters i. to vii. is generally ascribed to Nehemiah, while the following chapters are assumed by De Wette, Hävernick, and others, to have been written by some other author. According to Ewald, Bertheau, and others, the books of Nehemiah, Ezra, and the Chronicles were originally one work. All the questions relating to the book of Nehemiah are fully discussed in De Wette's *Einleitung in das Alte Testament* (8th ed., revised by Dr. Schrader). The dates of his birth and death are unknown. In the history of his people, in which he played a prominent part during the period of the restoration under the Persians, he first appears in 445 B. C. (See HEBREWS, vol. viii., p. 590.)

NEHER, Bernhard von, a German painter, born at Biberach, Würtemberg, in 1806. He studied under his father, Joseph Neher, and in Stuttgart, Munich, and Rome, where the king of Würtemberg enabled him to spend four years. After his return to Munich he executed, from cartoons which he had prepared in Italy, a stupendous fresco on the Isar gate of Munich, representing the entrance of the emperor Louis of Bavaria, which gave him a wide reputation, but was unfortunately partly destroyed. In 1836 he went to Weimar to embellish the grand-ducal palace with frescoes illustrative of Schiller and Goethe. In 1844 he became director of the art school at Leipsic, and in 1846 of that of Stuttgart. He was made a director of the latter in 1854, and decorations were conferred upon him in 1865 and 1869.

NEHLIG, Victor, an American painter, born in Paris in 1830. He studied under Abel de Pujol and Cogniet, removed in 1856 to the United States, spent some time in Cuba, became a resident of New York, and in 1870 was chosen

a member of the national academy of design. In 1872 he visited England. Among his pictures are "The Artist's Dream," "The Captive Huguenot," "Gertrude of Wyoming," "Hiawatha and Minnehaha," and "Pocahontas."

NEILGHERRY HILLS (Sansk. *Nilgiri*, blue mountains), a group of mountains in southern India, comparatively isolated from the other mountain systems of the country, but connected by an elevated ridge with the adjacent table land of Mysore, and thus with the Western Ghats, and by hill ranges also with the Eastern. They are situated between lat. $11^{\circ} 10'$ and $11^{\circ} 38' N.$, and lon. $76^{\circ} 30'$ and $77^{\circ} 10' E.$, in the W. part of the province of Madras, of which they form a political district (pop. in 1872, 50,194). The region to which they belong was transferred to the British in 1799 on the downfall of Tippoo Sahib. At an elevation of 5,000 ft. the group has a maximum length of 42 m. measured from N. E. to S. W., and averages 14 m. in width. Its general outline is triangular, with one side fronting Mysore and the other Malabar. On the south, at Palghat, the Neilgherries overlook the pass known as the gap of Coimbatore, which separates them from the hill region at the S. extremity of the peninsula. The surface of the mountains varies greatly in aspect and elevation, from undulating slopes and low ridges to grand peaks of lofty height. The highest is Dodabetta, 8,760 ft. above the sea, which was long supposed to be the loftiest summit in India S. of the Himalaya, but is now known to be surpassed by a mountain in the Annamalli range further S., which is a few hundred feet higher. Of the other peaks in the Neilgherry hills, five are more than 8,000 ft. high, four exceed 7,000 ft., and there are six over 6,000 ft. Granite is the prevailing geological formation, and the soil generally is black, rich, and fertile. Peat occurs in some localities. The unhealthy forest belt at the base of the group was long an obstacle to exploration; it is the haunt of numerous wild beasts, including the elephant and the tiger. In the hills the wood districts are open and park-like, while at the higher elevations is a well watered grass country with the vegetation of the temperate zone. The native Todas of this region differ both in appearance and language from all other races in India. They are tall and well formed, with light complexions and strongly marked Jewish features. Infanticide and polygamy prevail among them. A Hindoo tribe known as the Badakars, however, constitutes a prosperous, influential, and numerous portion of the population. Several other tribes are met with, sunk in the depths of degradation and superstition. The most important pursuit in the Neilgherry district is the cultivation of cinchona, introduced by the British government in 1860, and now also carried on by private planters. In 1871-'2 the government plantations covered 950 acres, and contained more than 2,500,000 plants, which yielded 72,983 lbs. of bark. There is also a government teak plan-

tation; and magnificent plantations of eucalyptus have been formed under the direction of the Madras forest department. The principal European station is at Utakamund, a small town 7,300 ft. above the sea, in lat. $11^{\circ} 24' N.$, lon. $76^{\circ} 47' E.$, near the centre of the group.

NEILSON, Lillian Adelaide. See supplement.

NEISSE, a fortified town of Prussian Silesia, on the southern Neisse at its confluence with the Biela, 30 m. S. W. of Oppeln; pop. in 1871, 19,376. The fortress, one of the most important in Prussia, was built by Frederick the Great. The town is clean and well built, and contains two Lutheran and eight Roman Catholic churches, a Roman Catholic gymnasium and other schools, several manufactories of linens and woollens, arms, and gunpowder, and a number of distilleries. Neisse was besieged three times in 1428 by the Hussites, taken by Frederick the Great in 1741, unsuccessfully besieged by the Austrians in 1758, and reduced by the French in 1807. In February, 1873, it was proposed to dismantle the fortifications.

NELATON, Auguste, a French surgeon, born in Paris, June 17, 1807, died there, Sept. 21, 1873. He studied under Dupuytren, took his degree in 1836, and was surgeon of prominent hospitals, adjunct professor in the faculty of Paris from 1839 to 1851, and subsequently regular professor of clinical surgery till 1867. In 1868 he was made senator. He was also a member of the academy, and the favorite surgeon of Napoleon III. He invented a remarkable method for the immediate extraction of calculi, distinct from all the processes of lithotritry, and effected many successful operations in this and other branches of his profession. With Velpeau and others he published *Rapport sur les progrès de la chirurgie* (1867); but his principal work is *Éléments de pathologie chirurgicale* (5 vols., 1844-'60; 2d ed., 1867-'70), of which vol. v., and according to some authorities also vol. iv., were written by Dr. A. Jamain.

NELSON. I. A central county of Virginia, bordered S. E. by the James river and N. W. by the Blue Ridge, and drained by the Rockfish, Rock, and Tye rivers; area, 340 sq. m.; pop. in 1870, 13,898, of whom 6,312 were colored. The surface is hilly and the soil fertile. A canal extending along the James river connects it with Richmond, and it is intersected by the Washington City, Virginia Midland, and Great Southern railroad. The chief productions in 1870 were 77,106 bushels of wheat, 186,858 of Indian corn, 98,771 of oats, 12,707 of Irish and 4,374 of sweet potatoes, 1,199,182 lbs. of tobacco, 6,629 of wool, 111,524 of butter, and 5,122 gallons of sorghum molasses. There were 1,952 horses, 2,246 milch cows, 707 working oxen, 3,073 other cattle, 3,048 sheep, and 8,423 swine. Capital, Lovingsston.

II. A central county of Kentucky, drained by Rolling fork and Beech fork of Salt river; area, about 350 sq. m.; pop. in 1870, 14,804, of whom 3,918 were colored. It has an undulating surface and a fertile soil, especially to-

ward the north. It is traversed by the Louisville and Nashville and Great Southern railroad, and its Lexington division. The chief productions in 1870 were 148,294 bushels of wheat, 22,085 of rye, 774,315 of Indian corn, 151,589 of oats, 25,583 of sweet potatoes, 5,150 tons of hay, 28,282 lbs. of wool, 205,289 of butter, and 8,713 gallons of sorghum and 10,052 of maple molasses. There were 5,406 horses, 1,542 mules and asses, 3,364 milch cows, 7,916 other cattle, 11,096 sheep, and 35,534 swine; 4 manufactories of carriages and wagons, 8 distilleries, 3 flour mills, 14 saw mills, and 2 wool-carding and cloth-dressing establishments. Capital, Bardstown.

NELSON. **I.** A province of New Zealand, forming the N. W. part of South island, bounded E. by the province of Marlborough, and S. by Canterbury; area, 11,000 sq. m.; pop. in 1871, 22,501. A portion of the W. part is mountainous. Iron, copper, and gold are found. The exports of gold from April 1, 1857, to Dec. 31, 1871, amounted to 1,126,504 oz., valued at £4,458,000. **II.** A seaport town, capital of the province, on a small harbor at the bottom of Blind bay, 78 m. (150 m. by water) W. of Wellington, and 1,280 m. S. E. of Sydney, Australia; pop. about 6,000; with suburbs, 8,000. It is the seat of an Anglican bishop, and has a literary institute and museum, numerous public and private schools, a college, several churches, and three branch banks. The chief manufactures are cloth and leather. Steamers ply regularly to the neighboring ports and Melbourne, and periodically to Sydney. Four newspapers were published in 1873, one of which was a daily.

NELSON, David, an American clergyman, born near Jonesborough, Tenn., Sept. 24, 1793, died at Oakland, Ill., Oct. 17, 1844. He was educated at Washington college, Va., and studied medicine in Danville, Ky., and at Philadelphia. He joined a Kentucky regiment as a surgeon in the war of 1812, and proceeded to Canada. On his return he resumed the practice of medicine. After making a profession of religion in early life, he relapsed into infidelity, but at length returned to his religious convictions, became a minister in the Presbyterian church, and was licensed to preach in 1825. He preached for nearly three years in Tennessee, and was engaged in the publication of a periodical called "The Calvinistic Magazine." In 1828 he succeeded his brother Samuel as pastor of the Presbyterian church in Danville, Ky. In 1830 he removed to Missouri, establishing a college in Marion co., 12 m. from Palmyra, of which he became the first president. In 1836, owing to the slavery question, Dr. Nelson, who was a warm emancipationist, removed to the neighborhood of Quincy, Ill., and established an institute for the education of young men. In the latter part of his life he was subject to epilepsy, which gradually impaired his faculties. He published "The Cause and Cure of Infidelity," which passed through many editions.

NELSON, Horatio, Viscount Nelson of the Nile, a British admiral, born at Burnham Thorpe, Norfolk, Sept. 29, 1758, killed in the battle of Trafalgar, Oct. 21, 1805. His childhood was marked by the fearless spirit for which he afterward became distinguished. He left school at the age of 12, and became a midshipman on board a ship destined for an attack on the Falkland islands; but this expedition having been given up, he went in a merchant ship to the West Indies. In 1773, although a boy, he sailed as coxswain of one of the two ships of Capt. Phipps's arctic expedition. On returning he was placed on board the man-of-war Seahorse, which sailed for the East Indies; but the climate soon prostrated him, and within 18 months he was compelled to return to England. Recovering his health on the voyage home, he passed with credit an examination for a lieutenantcy, April 8, 1777, and was appointed second lieutenant on the Lowestoffe, which was employed against the French and American privateers, who were harassing the British trade in the West Indies. He soon afterward became first lieutenant on board the Bristol flag ship; in December, 1778, was appointed commander of the Badger brig, and post captain on June 11, 1779, when he was assigned to the Hinchinbrook, 28, in which he distinguished himself at the siege of Fort San Juan and took the island of St. Bartholomew. But the crew of the Hinchinbrook were decimated by fever, and its commander was forced to return to England. He was next appointed to the Albemarle, 28, in the winter of 1781-2 cruised in the North sea, sailed for Quebec in April, 1782, and thence with a convoy to New York; he there joined the fleet under Sir William Hood, and with him went to the West Indies, where he remained till the peace of 1783. After his arrival in England he retired to St. Omer, but in the spring of 1784 took command of the Boreas, 28, ordered to the West Indies. At Nevis he captured four American vessels for violating the navigation laws. At the same island, March 11, 1787, he married a widow, the daughter of the governor, Mr. Herbert. After his return to England a writ was served upon him on the part of the American captains, who laid their damages at £20,000. But the government protected him, and he had no more trouble with the suit. When the war with France broke out he was appointed, Jan. 30, 1793, to the Agamemnon, 64, and joined the Mediterranean fleet commanded by Lord Hood. By him he was sent with despatches to Naples, where he made the acquaintance of Sir William and Lady Hamilton. Subsequently he commanded a small squadron sent to Corsica to coöperate with Paoli against the French, and took Bastia, May 19, 1794, after a siege of seven weeks. The Agamemnon was then ordered to Calvi to assist Gen. Sir Charles Stuart in the siege of that place. Here Nelson lost an eye from sand and small gravel driven into it by a shot striking the

ground near where he stood. His name was not mentioned in the "Gazette," however, and he keenly felt the neglect. Afterward serving under Admiral Hotham, who had succeeded Lord Hood, he distinguished himself in the engagement with the French fleet, which had come out from Toulon to give battle to the English, and boarded the *Ca Ira* and the *Censeur*, the only two ships taken. About this time he was made colonel of marines, and, hoisting a commodore's pennant, proceeded to the coast of Italy, blockaded Leghorn, and superintended the evacuation of Corsica. In sailing with a convoy to Gibraltar, he saw the Spanish fleet at the mouth of the straits, and on Feb. 13, 1797, brought the intelligence to Admiral Sir John Jervis, then commanding the Mediterranean squadron. By him he was appointed to the *Theseus*, 74, and participated in the battle of Cape St. Vincent on the morning of the 14th. In this battle Nelson disobeyed the admiral's orders to tack in succession, and, seconded by Trowbridge in the *Culloden* and *Collingwood* in the *Excellent*, bore down upon seven of the enemy's fleet, attacked the *Santissima Trinidad*, 136, passed on to the *San Nicolas*, 84, which he carried by boarding, and led his men on to the *San Josef*, 112, lying alongside, and compelled it to surrender. For his conduct Nelson, who had been created rear admiral before the action was known in England, was knighted and made a companion of the order of the bath. In April he was sent to bring away the troops from Porto Ferrajo, and shortly after commanded the inner squadron in the blockade of Cadiz. On July 14 he was sent to attack Santa Cruz, Teneriffe, and carried the place, but, not being able to capture the citadel, was forced to retire. In the attack his right arm was shattered by a grape shot, making amputation necessary, and he returned to England, where honors were showered upon him. Congratulatory letters were addressed to him by the first lord of the admiralty and the duke of Clarence; the freedom of the cities of London and Bristol was conferred upon him; he was made a knight of the bath, and received a pension of £1,000. In April, 1798, hoisting his flag in the *Vanguard*, 74, he rejoined Earl St. Vincent at Gibraltar, and on May 9 sailed from that place with a small squadron to ascertain the design of the vast armament fitting out at Toulon. On the 22d he encountered in the gulf of Lyons a sudden storm by which his ship was dismantled, and in the fog that followed he missed the French fleet, which had sailed for Egypt with Bonaparte and his army on board. Having received a reinforcement of ten ships of the line and one of 50 guns, he sailed for Alexandria, but failed to find the enemy. After obtaining supplies at Syracuse, he sailed again for Egypt, and on the morning of Aug. 1 descried the tri-color floating from the walls of Alexandria and the bay of Aboukir covered with ships. The

fleets joined battle at 6½ P. M., and, with an interruption of ten minutes, when the French flag ship *L'Orient* blew up, maintained it till daybreak. (See *ABOUKIR*.) Nelson declared victory a too feeble word for the result of this battle, and called it a conquest. Had he been provided with small craft, he could have destroyed in a few hours the store ships and transports in the harbor of Alexandria; and so deeply did he feel the want of these, that in a despatch to the admiralty he declared: "Were I to die this moment, want of frigates would be engraven on my heart." During the engagement Nelson received a severe though not dangerous wound on the head from a langridge shot. The news of the battle of the Nile was received with boundless enthusiasm by the enemies of France, and congratulations and rewards without number were showered upon the victorious commander. He was created Baron Nelson of the Nile, with a pension of £2,000 to himself and his two immediate successors; received magnificent presents from the sultan, the king of Sardinia, the king of Naples, the emperor of Russia, and the East India company; and the thanks of parliament and gold medals were voted to him and the captains engaged in the action. Seventeen days after the battle Nelson sailed for Naples, and was received with great demonstrations of joy both by the populace and the court. Encouraged by his victory, the Neapolitan government broke openly with the directory, and sent an army under Gen. Mack against the French troops occupying the Papal States. But an incapable commander and cowardly soldiers were no match for the forces of France. The invading army was beaten back, Naples was entered in turn, the royal family compelled to flee, and the short-lived Parthenopean republic established. The king and queen and their suite were conveyed by Nelson to Palermo. The royalists, however, soon took the field under the lead of Cardinal Ruffo, and advanced upon the city of Naples. The garrisons of the *castel Nuovo* and the *castel dell'Ovo*, consisting of Neapolitan insurgents, capitulated to the cardinal, June 23, 1799, on condition that they should be allowed to march out with all the honors of war, and that the persons in the forts and all prisoners taken by the king's troops should be unmolested or conveyed to Toulon and there set at liberty. The part taken by Nelson in annulling this capitulation has been condemned as an ineffaceable blot upon his fame by Southey and nearly all his other biographers; but the publication by Sir Harris Nicolas of the "Nelson Despatches" places his conduct in a much more favorable light. On the 24th Nelson arrived in the bay, and immediately ordered the flag of truce to be pulled down, on the ground that the action of the cardinal in granting a capitulation was not only unauthorized but in direct opposition to the commands of the king, whose orders were explicit not to treat with the rebels. On

the next day, no steps having yet been taken to carry the capitulation into effect, he addressed a note to the garrisons, stating that he would not permit them to embark or leave those places, and their surrender must be at discretion. On the 26th the insurgents submitted, with full knowledge that the cardinal's conditions had been annulled, and were detained as prisoners until the arrival of the king, July 10, when they were given up to the Neapolitan authorities. That Nelson was justifiable in this transaction is now generally admitted; that he did not act without regard to honor and good faith is apparent from his treatment of the garrison of Castellamare, who having surrendered before his arrival were permitted to go free, although the officer who received their capitulation had no authority to grant them terms. The hanging of Prince Caraccioli, the Neapolitan admiral, who had joined the insurgents and served under the "Parthenopean republic," is another event which clouds Nelson's memory. Caraccioli was accused of being a traitor, and having been captured and given up to Nelson was tried by a Neapolitan court martial, who condemned him to death, and submitted their sentence to Nelson as superior officer for confirmation. It has been charged, though perhaps without sufficient proof, that in these transactions the British admiral acted under the baneful influence of Lady Hamilton, with whom his illicit connection had already commenced. Although ordered by Lord Keith to sail with his whole force for the protection of Minorca, he continued in the bay of Naples, and succeeded in restoring the king to his dominions. For his services he received a sword splendidly enriched with diamonds, and was rewarded with the dukedom of Bronte, with a revenue of £3,000 a year. He soon after assisted Capt. Ball in the siege of Malta; but, mortified by the appointment of Lord Keith to the chief command in the Mediterranean, he returned to England through Germany in company with Sir William and Lady Hamilton, and landed at Yarmouth, Nov. 6, 1800, after an absence of three years. Honors of every kind awaited him; but within three months he was separated from his wife on account of his infatuated attachment to Lady Hamilton. His last words to his wife were: "I call God to witness that there is nothing in you or in your conduct that I wish otherwise." In December, 1800, a maritime alliance was formed between Russia, Prussia, Denmark, and Sweden in regard to the rights of neutral nations in war. For the purpose of breaking up this confederacy, a fleet of 52 sail was sent in March, 1801, to the Baltic under Sir Hyde Parker, Nelson consenting to act as second in command. The squadron passed the Sound on the 30th, and entered the harbor of Copenhagen. To Nelson, at the head of 12 ships of the line and smaller vessels, making 36 in all, was assigned the attack; against him were opposed 18 vessels

mounting 628 guns, moored in a line a mile in length, and flanked by two batteries. The action began about 10 A. M., April 2, and lasted five hours. About 1 o'clock Sir Hyde Parker made the signal for discontinuing. Nelson ordered it to be acknowledged, but, putting the glass to his blind eye, exclaimed: "I really don't see the signal. Keep mine for closer battle still flying. That's the way I answer such signals. Nail mine to the mast." By 2 o'clock, the Danish fleet being almost entirely taken or destroyed, he wrote to the crown prince the following note: "Vice Admiral Lord Nelson has been commanded to spare Denmark when she no longer resists. The line of defence which covered her shores has struck to the British flag; but if the firing is continued on the part of Denmark, he must set on fire all the prizes he has taken, without having the power of saving the men who have so nobly defended them. The brave Danes are the brothers and should never be the enemies of the English." An armistice of 14 weeks was agreed to, and in the mean time the policy of Alexander, the new emperor of Russia, broke up the confederacy, and left matters on their old footing. For this battle, which Nelson said was the most terrible of all in which he had ever been engaged, he was raised to the rank of viscount. On July 24 he was made commander-in-chief, from Orfordness to Beachy Head, of the squadron for the defence of England; and on Aug. 15 he attacked the flotilla at Boulogne, but was forced to retreat with considerable loss. After the treaty of Amiens he retired with Sir William and Lady Hamilton to his seat at Merton in Surrey. But war breaking out again, he was appointed commander of the Mediterranean fleet, and set sail May 20, 1803. He immediately blockaded Toulon, but in spite of his utmost vigilance a fleet escaped out of that port on Jan. 18, 1805, and shortly afterward joined the Cadiz squadron. Nelson followed in pursuit to the West Indies, and back again to Europe, but being unsuccessful he returned to England. Upon the receipt of the intelligence that the combined French and Spanish fleets were in Cadiz, he resumed his command of the Mediterranean fleet, and encountered the enemy off Cape Trafalgar, Oct. 21, 1805. The force under him consisted of 27 ships of the line and 4 frigates; the force opposed of 33 ships of the line and 7 frigates. On that day he wore his admiral's coat, bearing upon his left breast the insignia of the orders with which he had been invested. To all remonstrance against wearing so conspicuous a uniform he replied, referring to the insignia: "In honor I gained them, and in honor I will die with them." At 11.40 A. M., while bearing down on the enemy, he hoisted the signal, "England expects every man to do his duty," which was received with tremendous cheering by the whole fleet. At 10 minutes after noon the action began. In the heat of the battle, about 1½ P. M., he was struck in the shoul-

der by a musket ball. "They have done for me at last, Hardy," said he, as he was raised up from the deck; "my backbone is shot through." He was carried below, and the surgeon examining his wound pronounced it to be mortal. He continually expressed the greatest anxiety as to the result of the battle. At length Capt. Hardy came down from the deck, and congratulated his dying commander on having gained a complete victory. He did not know how many had struck, but 14 or 15 at least had surrendered. "That's well," answered Nelson, "but I had bargained for 20." Anxious that the vessels taken should be saved from the possible danger of a storm, he added in a stronger voice: "Anchor, Hardy, anchor. Do you make the signal." The order was not obeyed, and in the gale that came up the following night all but four of the prizes were destroyed or lost. Next to his country, Lady Hamilton occupied his thoughts. "Take care of my dear Lady Hamilton, Hardy; take care of poor Lady Hamilton." A few minutes before he died, he turned to the chaplain, and said: "Doctor, I have not been a great sinner. Remember that I leave Lady Hamilton and my daughter Horatia as a legacy to my country." He then frequently repeated: "Thank God, I have done my duty." These were the last words he uttered, and at 4½ P. M. he expired without a groan. The body was placed in a coffin made out of the mast of the *L'Orient*. This singular gift had been presented him by Capt. Hallowell, and before Nelson left London for the last time he had called at his upholsterer's and told him to get it ready, for he should soon require it. He was buried in St. Paul's cathedral, Jan. 8, 1806, and his funeral, conducted at the public expense, was the most solemn and magnificent spectacle which had ever been witnessed in England. Honors were heaped upon his family. His brother, the Rev. William Nelson, D. D., was created Earl Nelson of Trafalgar and Merton, with an annual grant of £6,000, and permission to inherit the dukedom of Bronte; £10,000 were voted to each of his two sisters, besides £100,000 for the purchase of an estate. A few hours before his death he appended a codicil to his will, in which he left Lady Hamilton as a legacy to his king and country, and his "adopted daughter, Horatia Nelson Thompson," to the beneficence of his country. "These," continues the document, "are the only favors I ask of my king and country at this moment, when I am going to fight their battle." This codicil his brother concealed until the parliamentary grant to himself had been completed; and to it and his dying request in behalf of the same persons the British people paid no attention.—Nelson is the greatest name in the naval annals of England. "He annihilated the French navy," says Alison, "by fearlessly following up the new system of tactics, plunging headlong into the enemy's fleet, and doubling upon a part of their line, in the same manner as Napoleon practised

in battles on land." As he left no legitimate children, his viscounty became extinct, but the barony devolved by limitation upon his brother William, whose grandnephew Horatio, Earl and Baron Nelson and Viscount Merton, is the present representative of the family. Horatia Nelson was the admiral's natural daughter, probably by Lady Hamilton; for it is a singular fact that while he is universally considered her father, her maternity is doubted, and there are not wanting patriotic British critics who maintain that the attachment between Nelson and Lady Hamilton was purely Platonic. Horatia was married to the Rev. Philip Ward, an English clergyman.—Among the biographies of Lord Nelson we may cite Clarke and MacArthur's "Life of Admiral Lord Nelson" (2 vols. 4to, 1809); Robert Southey's "Life of Nelson" (2d ed., 8vo, 1831); Pettigrew's "Memoirs of the Life of Vice Admiral Lord Viscount Nelson" (2 vols. 8vo, 1849); and E. De Forges, *Histoire de Nelson*, from official documents and Nelson's private correspondence (Paris, 1860). His letters to Lady Hamilton (2 vols. 8vo) were published in 1814, and the "Letters and Despatches of Lord Nelson," edited by Sir Harris Nicolas (7 vols. 8vo), in 1844-6.

NELSON, Samuel, an American jurist, born at Hebron, N. Y., Nov. 10, 1792, died at Coopers-town, Dec. 13, 1873. His father, a farmer, emigrated to the United States from the north of Ireland in the latter part of the 18th century. He graduated at Middlebury college, Vt., in 1813, studied law at Salem, N. Y., was admitted to the bar in 1817, and commenced practice at Cortland. In 1820 he was a presidential elector. From 1823 to 1831 he was circuit judge, after which he became associate justice, and in 1837 chief justice of the supreme court of the state of New York. In 1844 he was appointed associate justice of the United States supreme court. In 1846 he was a member of the state constitutional convention, and in 1871 of the joint high commission to settle the Alabama claims. In October, 1872, he was compelled by declining health to retire from the bench. He resided for more than 50 years at Cooperstown.

NELSON, Thomas, an American statesman, born in York co., Va., Dec. 26, 1738, died there, Jan. 4, 1789. His father, William Nelson, for many years president of the colonial council, sent him in his 14th year to Cambridge, England, where he was educated at Trinity college. In his 24th year he married, and settled at Yorktown, where he possessed a great estate and led a life of leisure. He became a decided partisan of the American cause, and rendered efficient service in the house of burgesses. He was a member of the provincial conventions of 1774 and 1775, and in that which met in May, 1776, to frame a constitution for Virginia, in which he offered the resolution instructing the Virginia delegates in congress to propose a declaration of independence. Having been elected a delegate to congress, he

signed the declaration of July 4, 1776. In May, 1777, he was obliged by indisposition to resign his seat. In the following August, during the alarm occasioned by the entry of the British fleet under Admiral Howe within the capes of Virginia, he was appointed commander-in-chief of the state forces; and soon after, in response to an appeal from congress, he raised a troop of cavalry which he led to Philadelphia. The danger apprehended from Howe's expedition having been averted, his corps was disbanded, and he resumed his duties as a member of the legislature. He strongly opposed the proposition to sequester British property, on the ground that it would be an unjust retaliation of public wrongs on private individuals. In February, 1779, he again took his seat in congress, but was soon obliged by illness to resign. In May, however, he was suddenly called upon to organize the militia to repel a marauding expedition which was ravaging the Virginia coast. Congress having called for contributions to provide for the French fleet and armament, the general assembly of Virginia resolved early in June, 1780, to borrow \$2,000,000 to be deposited in the continental treasury by the middle of the month. The public credit, however, was so low that there seemed little probability that the required sum could be obtained. Gen. Nelson on his personal security raised a considerable portion of the loan. About the same time he advanced money to pay two Virginia regiments ordered to the south, which had refused to march until their arrears were discharged. His ample fortune was so seriously impaired, that he was involved in pecuniary embarrassments in the latter part of his life. In 1781 he succeeded Jefferson as governor of the state, and to repel the invasion of the enemy was compelled to assume dictatorial powers; and it was in no small degree owing to his exertions that the American army was kept together during its stay in Virginia. His extra-legal acts were subsequently approved by the Virginia legislature. He participated in the siege of Yorktown as commander of the Virginia militia, and directed that his own house, the largest and best in the place, should be bombarded. He resigned his office in November, 1781, and passed the rest of his life in retirement.

NELSON RIVER, of British North America, issues from the N. extremity of Lake Winnipeg, passes through a series of lakes, and falls into Hudson bay, N. of Fort York, after a N. E. course of about 350 m. It discharges a great volume of water, but its navigation is almost impossible, owing to numerous rapids and falls.

NELUMBUM. See **WATER LILY**.

NEMAH. I. A S. E. county of Nebraska, separated from Missouri by the Missouri river, and intersected by the Little Nemaha; area, about 400 sq. m.; pop. in 1870, 7,593. The surface is diversified by undulating prairies, bluffs, bottom lands, and groves of oak, hickory, walnut, &c., along the streams. The

underlying rocks are limestone and sandstone, and the soil is fertile. The chief productions in 1870 were 33,790 bushels of wheat, 224,695 of Indian corn, 35,831 of oats, 16,140 of potatoes, 49,425 lbs. of butter, and 3,015 tons of hay. There were 728 horses, 539 milch cows, 1,587 other cattle, 454 sheep, and 1,483 swine. Capital, Brownville. II. A N. E. county of Kansas, bordering on Nebraska, and watered by numerous streams; area, 720 sq. m.; pop. in 1870, 7,339. It is traversed by the St. Joseph and Denver City railroad, and by the Central branch of the Union Pacific line. The surface is undulating, the soil fertile. The productions in 1870 were 112,612 bushels of wheat, 26,840 of rye, 358,871 of Indian corn, 107,737 of oats, 50,074 of potatoes, 12,018 lbs. of wool, 28,285 of cheese, 200,460 of butter, and 17,167 tons of hay. There were 3,307 horses, 3,405 milch cows, 5,815 other cattle, 3,591 sheep, and 4,119 swine. Capital, Seneca.

NEMEAN GAMES, one of the four great national festivals of the Greeks, so called from Nemea in Argolis, where they were held every second year. The first one the date of which can be fixed approximately on historical authority occurred in the 52d or 53d Olympiad (572-565 B. C.). The period from one celebration to another was called a Nemead. They were instituted by the seven against Thebes in commemoration of the death of the infant Opheltes, which had been destroyed by a dragon while Hypsipyle its attendant had gone to show the seven a well. On their return they slew the dragon and instituted funeral games. Other legends ascribe them to Hercules in honor of his destruction of the Nemean lion. It is probable, however, that these refer to a restoration of the ancient festival, and its alteration to a celebration in honor of Jupiter. At first they were of a warlike character, only warriors and their sons participating, but they were afterward thrown open to all the Greeks. The exercises consisted of horse racing, running in armor in the stadium, wrestling, chariot racing, quoit throwing, boxing, throwing the spear, archery, and musical contests. The prize was at first a chaplet of olive branches, but afterward one of parsley. The management of these games belonged at different times to Cleonæ, Corinth, and Argos. Philip of Macedon was once honored by the Argives with the presidency of the Nemean games; and at their celebration in 195 B. C., Quintus Flamininus proclaimed the freedom of Argos.

NEMESIANUS, **Marcus Aurelius Olympius**, a Latin poet of the latter half of the 3d century A. D., supposed to have been a native of Africa. He was the most successful poet at the court of the emperor Carus, and wrote on fishing, hunting, and aquatics; but all his works have perished except a fragment of the *Cynegetica*, on hunting, consisting of 325 hexameter verses, remarkable for neatness and purity of style. It was first printed at Venice in 1534; the best edition is that of Stern (Halle, 1832).

NEMESIS, in Grecian mythology, a daughter of Night, though sometimes called a daughter either of Erebus or of Oceanus. She was a personification of conscience, and is mentioned by Hesiod in connection with *Ædos* (Shame). It was believed by the Greeks that the gods were enemies of excessive human happiness, and that there was a power which preserved a proper compensation in human affairs, from which it was impossible for the sinner to escape. This power was embodied in Nemesis, who was in a special manner the avenger of family crimes and the humbler of the overbearing, and was particularly worshipped at Rhamnus, Patræ, and Cyzicus. She was usually represented in works of art as a virgin, sometimes standing in a thoughtful attitude, holding in her left hand a bridle or branch of an ash tree, and in her right a wheel with a sword or scourge.

NEMESIUS, bishop of Emesa, a Greek philosopher who flourished about 400. He has been identified by some writers with another Nemesis, a friend of Gregory Nazianzen, and governor of Cappadocia. Nemesis wrote a complete treatise on anthropology (*Περὶ Φύσεως Ἀνθρώπου*), in which the Neo-Platonic philosophy predominates. He maintains the preëxistence of souls and the freedom of the will, affirms that this world is not to be destroyed, and denies the existence of a world-soul and the transmigration of spirits. Passages of this work are considered by some modern writers to indicate a knowledge of the circulation of the blood and the functions of the liver. It was first attributed to Gregory Nazianzen, and a Latin translation of it was published under his name by Burgundius Pisanus (fol., Strasbourg, 1512), and a second Latin translation by Giorgio Valla (Lyons, 1538). The Greek text, with the true authorship, was published separately by Nicasius Ellebodus (Antwerp, 1565), by Matthäus (Halle, 1802), and in vol. xl. of Migne's *Patrologie grecque*. There are translations into English by George Wither (London, 1636), into German by Osterhammer (Salzburg, 1819), and into French by J. B. Thibault (Paris, 1844).

NEMI (anc. *lacus Nemorensis* and *Speculum Dianæ*, mirror of Diana), a lake of Italy, 17 m. S. E. of Rome, famous in antiquity for a temple of Diana. This was situated 3 m. from Aricia (now La Riccia), an ancient city of Latium, which thence received the surname *Nemoralis*. On the N. E. shore of the lake is the village of Nemi, on the site of the ancient town of Nemus. Lake Nemi is smaller than Lake Albano, and of a more regular shape, and is surrounded in every direction by steep, high, and wooded hills. It was once the crater of a volcano. The lake has no visible natural outlet, the waters being carried off by an ancient artificial passage. It is a favorite subject of painters.

NEMOURS, Louis Charles Philippe Raphaël d'Orléans, duke de, a French prince, the second son of Louis Philippe, born in Paris, Oct. 25,

1814. He was in February, 1831, elected king of the Belgians by the national congress assembled at Brussels, but his father prohibited him from accepting the crown. He served in the Belgian campaign of 1831, and subsequently in Algeria, where he gained in 1837 the rank of lieutenant general. The chamber declined in 1840 to grant him 500,000 francs, which led to the overthrow of the Soult cabinet. He married in the same year the princess Victoria of Saxe-Coburg-Gotha. In 1841 he returned to the army in Algeria. The death of his elder brother, the duke of Orleans (July 13, 1842), led to a proposition, which was not adopted, to make him regent in the event of his father's death. On the outbreak of the revolution of 1848 he accompanied the duchess of Orleans on her fruitless errand to the chamber, and subsequently he remained with the rest of the Orleans family in England till 1871, when they were permitted to reside in France. The duchess died Nov. 10, 1857, leaving two sons: the count d'Eu, husband of the presumptive empress of Brazil, and a marshal in the Brazilian army; and the duke d'Alençon (born at Neuilly, July 12, 1844), a naval officer, who married a Bavarian princess in 1868. The princess Marguerite, the eldest of the duke's two daughters, married the Polish prince Ladislas Czartoryski, Jan. 15, 1872.

NENA SAHIB. See **NANA SAHIB**.

NENNIUS, a doubtful British historian, supposed to have flourished in the early part of the 9th century, though Vossius places him in the 7th. According to several passages of the work attributed to him, he was a monk of Bangor in Wales. This work is entitled *Historia Britonum*, or *Eulogium Britannia*, and relates the history of Britain from the arrival of Brutus the Trojan, grandson of Æneas, to A. D. 655. The best edition is that of Stevenson (London, 1838). An English translation by the Rev. W. Gunn has been republished in Bohn's "Antiquarian Library" (London, 1848).

NEOGRAD. See **NÓGRÁD**.

NEO-PLATONISM, a system of philosophy and theosophy whose original seat was Alexandria, where it sprang up toward the end of the 2d century. Its founder was Ammonius Saccas, who was brought up by his parents in the Christian faith, but renounced it and became a Hellenist. He died A. D. 243. His most distinguished disciples were Plotinus, Longinus the philologist, and two Origenes, one of whom surnamed Adamantius was the famous father of the church. About two centuries earlier Philo, an Alexandrian Jew, born probably a few years before Christ, had promulgated a system by which he sought to reconcile the philosophy of Plato with the teachings of Moses. He held that the Hebrew Scriptures contained an internal sense in which were hidden all the doctrines of the Greek philosophy. (See **PHILO JUDÆUS**.) Ammonius endeavored to reconcile the doctrines of Aristotle with those of Plato, and both with Christianity, and hence

his school was called eclectic. He taught that God is primarily essence, and secondarily knowledge and power, and that asceticism is the true way to attain to a knowledge of the infinite. Little however is known of his teachings, as he left no writings, and his disciples bound themselves not to divulge his doctrines. Plotinus was the first to put the new philosophy into writing, and to teach it at Rome, where he went to live in 244. He taught that the One or the Good, which with Plato was the highest of the Ideas, is elevated above the sphere of the Ideas, and above all the objects of rational apprehension, and that the Ideas, to which Plato ascribed independent existence, are emanations from this One, the soul an emanation from the Ideas, and so on. The One, or the Good, is neither reason nor an object of rational cognition. From the excess of its energy it sends forth an image of itself. This image is *Nous* or mind. The *Nous* in turn produces as its image the soul which exists in it, as itself exists in the One. The body is in the soul and depends on it; but the soul is absolutely separable from the body, not only in its thinking power, but also in its lower faculties. It precedes and survives the body. The business of man is to return to God, whom he as a sensuous being has estranged from himself. The means for this return are virtue, philosophic thought, and above all the ecstatic intuition of God and the becoming one with him. Prominent among the disciples of Plotinus was Porphyry, who died about 304. He appears to have taught more distinctly than his master the doctrine of the emanation of matter from the soul. He also maintained that the world was without beginning in time. He attacked Christianity, and especially the divinity of Jesus. Iamblichus, who died about 330, employed the Neo-Platonic philosophy in support of paganism, and relied more on Pythagorean speculations as to the mystical powers of numbers than on Platonic ideas. Among his disciples was the emperor Julian the Apostate. The attempt to overthrow Christianity and revive paganism failed, and the Neo-Platonists now applied themselves to scientific studies, and especially to commentaries on Plato and Aristotle. Proclus was the most important of these later writers.—Some writers give to Neo-Platonism a much wider scope than that of the school of Ammonius and his disciples. They include in it not only Philo-Judeus, but several of the Christian fathers besides Origen, as for instance Clement of Alexandria, Gregory Nazianzen, and Cyril of Alexandria. (See ALEXANDRIAN SCHOOL.)

NEOPTOLEMUS. I. The son of Achilles and Deidamia, originally called Pyrrhus from his red hair. When it was prophesied that Troy could not be taken without the aid of the son of Achilles, Ulysses and Diomedes were sent to bring him thither. He was one of the warriors concealed in the wooden horse. He slew Priam, sacrificed Polyxena on the tomb of

Achilles, and married Andromache, who bore him several sons. II. An officer of Alexander the Great, who first distinguished himself at the siege of Gaza in 332 B. C. After the death of the conqueror, Armenia was assigned to Neoptolemus. When the Macedonian generals took up arms to contend for the empire, he refused to support Perdiccas, and he was finally killed in battle by Eumenes.

NEOSHO, a S. E. county of Kansas, intersected by the Neosho river; area, 576 sq. m.; pop. in 1870, 10,206. It is traversed by the Missouri, Kansas, and Texas, and the Leavenworth, Lawrence, and Galveston railroads. The surface is undulating or level, and the soil is fertile. The chief productions in 1870 were 27,466 bushels of wheat, 199,997 of Indian corn, 48,241 of oats, 27,522 of potatoes, 59,025 lbs. of butter, and 4,943 tons of hay. There were 1,981 horses, 2,257 milch cows, 5,589 other cattle, 1,712 sheep, and 2,700 swine. Capital, Erie.

NEPAUL, an independent kingdom of India, bounded N. by the Himalaya mountains, which separate it from Thibet, E. by the British district of Darjeeling and the protected native state of Sikkim, and S. and W. by Bengal, Oude, and the Northwest Provinces. It is included between lat. 26° 25' and 30° 15' N., and lon. 79° 45' and 88° 20' E.; length W. N. W. and E. S. E. about 500 m., greatest breadth 150 m.; area estimated at 50,000 sq. m.; pop. estimated at 2,000,000. The largest town is Katmandu, the capital. Nepaul is intersected by several large rivers, some of which have their sources on the table land of Thibet, beyond the Himalaya, through which they force their way by narrow chasms of great depth. The three great river systems of Nepaul comprise the Gogra and its tributaries in the west, the Gunduk and its feeders in the middle region, and in the east the alpine basin of the Coosy or Cosi. There are very few lakes in the country. The greater part of the kingdom belongs to the Himalaya region, which presents a succession of vast ridged mountain slopes with narrow glens between them; but the Nepaulese territory also includes a tract about 20 m. in width lying within the plain which stretches southward from the base of the mountains. In respect to elevation the country is naturally divisible into a lower region, extending from the great plain of India to a height of 4,000 ft. above the sea level; a central region, comprising all between 4,000 and 10,000 ft.; and an upper region, reaching thence to the highest peaks. There are several summits of stupendous height, among which is Mt. Everest (29,002 ft.), the highest known mountain in the world. From the N. boundary, which lies within the limit of perpetual snow, the elevations gradually sink into lower and lower hills, among which lies the great valley of Nepaul, in which is situated the capital. It is 4,500 ft. above the sea, measures 16 m. in each diameter, and is watered by the Bagmutty

river, flowing southward. At the foot of these hills a belt of forest occurs, running E. and W. throughout the length of the country, and reaching within 10 m. of the S. frontier. Although a dry region, this line of forest is exceedingly malarious. It is rich in valuable timber, of which the saul tree is the most important. Succeeding this on the south is the Terai or Tarai (a Turanian word signifying lowlands), a black, level, humid, malarious region, from 10 to 20 m. broad, skirting the frontier of the Bengal provinces and Oude, an open waste covered with heavy grass. The Terai, the forest belt, and a low sandstone range just above the latter, all belong to the lower region of elevation, throughout which malaria prevails. Above these tracts the climate is remarkably equable and healthful. During the N. E. monsoon, from October to March, the weather is cold and dry, while it is wet and hot from April to September, during the prevalence of the S. W. monsoon. In the central region the temperature for months at a time will vary but a few degrees from 55° F. While these are the general characteristics of the climate, great differences, due to variations of altitude and local causes, will be found between different districts. The geological formation of the central region consists of granite, gneiss, and schists. Iron, lead, copper, and sulphur are found; and gold and silver have also been said to exist, but it is thought that they are very scarce if not entirely wanting. The soil is remarkably rich, and the productions vary with the degrees of elevation. The bamboo, rattan, sugar cane, pineapple, and various other tropical fruits between the ridges of the hills and mountains, in the lowlands, give place to the oak, pine, barley, and millet, as the country rises toward the interior. Much land is cultivated in terraces, great attention being paid to its irrigation. Rice, maize, wheat, cotton, three kinds of pulse, and tobacco are grown. Rice is the staple food; several varieties of it are cultivated in cold and dry places, and even where snow falls. Various roots and herbs form a considerable part of the sustenance of the poorer inhabitants. The number of horned cattle is not great, but there are large flocks of sheep, some of great size with fine wool, from whose milk the Nepaulese make cheese. Horses are brought from Thibet. Among the wild animals, the elephant, the tiger, the leopard, deer, antelopes, and monkeys are found in the lower region; the sun bear, wild cats, and wild dogs, in the middle region; and in the upper region, the Indian bull (*bos gauris*), the true bear, wild goats, wild sheep, ounces, and foxes. The woods are inhabited by great numbers of peculiar birds, and the rivers are abundantly stocked with fish.—The inhabitants consist of a variety of races, the dominant people being the Gorkhas, a tribe of Mongol origin, Hindoos in religion, who conquered the country about the close of the 18th century. They have enlisted in large numbers

in the British Indian army, and their services during the sepoy mutiny of 1857, particularly at the siege of Delhi, have caused them since to be regarded as valuable soldiers. They are faithful and courageous, though not very capable of endurance. (See GORKHAS.) Many Hindoos from Chitore settled in Nepal at the time of the Mohammedan invasion, and some of them have preserved their blood pure to the present time, while others have intermarried with Chinese and Tartars. The Hindoos are found chiefly in the west; the east is populated by aboriginal tribes, among which are the Newars, Magars, Gurungs, Jariyas, Dhenwars, Booteas, Mhanjees, and Bhanras. The Newars, who are the most important of these, are an industrious agricultural and commercial people, more advanced in the mechanical arts than the mountain tribes, ingenious and peaceable, excessively dirty, of middle size and great strength, with round flat faces, small eyes, broad noses, and open countenances. They are Buddhists, but have a priesthood of their own, and reject the Thibetan model of Buddhism which prevails among the other aboriginal tribes of Nepal. Most of their arts appear to have been introduced from Thibet. Polyandry prevails to a limited extent. Thirteen dialects are spoken in the kingdom, of which but two possess any literature: the Newari, or language of the Newars, and the Parbattia, an Indian Prakrit, spoken by the Gorkhas. Some coarse cotton cloth is made, and the natives work very well in iron, copper, and brass, and are good carpenters, though they never use the saw. The trade of the country is not of much importance, being injured by numerous government monopolies. A considerable quantity of timber is floated down the rivers, and finds a market principally at Calcutta. The government is strictly despotic, and essentially military in its character. Every male inhabitant is liable to military duty for one year, and there is a standing army of about 35,000 men, armed and disciplined in some measure after the model of European troops.—Of the history of Nepal little is known until the invasion of the Gorkhas (1768); it seems never to have been subject to the Moguls or any other great Asiatic conquerors. A war in which it became involved with Thibet in 1790 led to hostilities with the emperor of China, who, regarding himself as the protector of the lamas, in 1792 sent an army of 70,000 men against the Nepaulese and checked the extension of their territory to the northward. A treaty of commerce was concluded with the British in 1792, and from 1802 to 1804 a political resident at the court of Katmandu represented the British government. In the mean time the country had been a prey to intestine feuds, during which it is remarkable that its boundaries were enlarged on all sides, except toward Thibet. In consequence of the repeated encroachments of the rajah upon the East India company's territories, the

British declared war in 1814, and invaded the country on the W. frontier, where their troops met with repeated losses, and their commander, Gen. Gillespie, was slain. In the following year, however, the campaign under Sir David Ochterlony was attended with very different results. The victory of Malown, the capitulation of the famous Nepaulese commander Ameer Singh, and finally the rapid advance of the victors toward Katmandu, obliged the Nepaulese monarch to make peace, and a treaty was signed very favorable to the British in March, 1816. Throughout the mutiny of 1857 the Nepaulese cultivated the friendship of the British, and the prime minister Jung Bahadur defeated the last remnant of the rebels in December, 1859. The policy of the government toward foreigners, however, is exceedingly exclusive.—Much valuable information concerning the country is contained in the work on Nepaul and Thibet by B. H. Hodgson, formerly British minister at Katmandu (1874). See also Oliphant, "A Journey to Katmandu" (1852).

NEPENTHE (Gr. *νῆς*, not, and *πένθος*, grief), a soothing drug known to the Egyptians, from whom, according to Homer, Helen learned the art of compounding it. According to Diodorus Siculus, the Theban women also possessed the secret of its preparation.

NEPENTHES, in botany. See **PITCHER PLANTS**.

NEPHRITE. See **JADE**.

NEPOMUCEN, **John**, or **John of Nepomuk**, a saint of the Roman Catholic church, born at Nepomuk or Pomuk, Bohemia, about 1330, died in Prague in 1383 or 1393. He graduated at the university of Prague, and was successively rector of the church of St. Gall in Prague, canon of the metropolitan chapter, and rector of Tein. In 1378 he was chosen court preacher by the emperor Wenceslas, and appointed almoner and chaplain to the empress Johanna. He was imprisoned for reproving the emperor's cruelty, and was offered his liberty on condition of revealing to Wenceslas the confession of the empress. Refusing to do this, he was inhumanly tortured. Being released at the solicitation of Johanna, he was urged anew to disclose the desired secret, and finally, bound hand and foot, was cast into the Moldau. The body was taken from the river and buried amid a vast concourse and universal grief. The miracles said to be performed at his tomb attracted pilgrims from all parts. He was regarded as a martyr by the Bohemians, and was canonized by Benedict XIII., March 19, 1729, and designated as the patron saint of Bohemia. His festival is celebrated on May 16. Since his canonization several writers have contested the authenticity of the facts recited in the legend of John Nepomucen. Some maintain that two personages named John of Nepomuk existed nearly at the same time; and that a great similarity in the circumstances attending their death caused much confusion in the popular traditions concerning them.—See Berg-

hauer, *Protomartyr Penitentia* (Augsburg, 1736); Marne, *Vie de St. Jean Nepomucène* (Paris, 1741); Pubitschka, *Ehrenrettung des heiligen Johannes von Nepomuk* (Prague, 1791); and Abel, *Die Legende des heiligen Johannes von Nepomuk* (Berlin, 1855).

NEPOS, **Cornelius**, a Roman author, probably a native of Verona or its vicinity, died in the reign of Augustus. Nearly all his works have perished. He wrote *Chronica*, an epitome of universal history; *Exemplorum Libri*, a collection of remarkable sayings and doings; *De Historicis*, and *De Viris Illustribus*. Two of the lives comprised in the last named work, those of Cato and Atticus, are extant. The well known *Excellentium Imperatorum Vitæ*, first printed at Venice in 1471, and long ascribed to Æmilius Probus, is now considered an abridgment by him of the work of Nepos. It has passed through numberless editions, and has been translated into most European languages.

NEPTUNE (**NEPTUNUS**; called by the Greeks Poseidon), in mythology, the principal god of the sea, and originally also of the rivers and springs. He was a son of Saturn and Rhea, and a brother of Jupiter, Pluto, Ceres, Vesta, and Juno. Like his brothers and sisters, he was swallowed by his father as soon as he was born, and thrown up again; or according to another account, his mother saved his life by hiding him among a flock of lambs, and offering to Saturn a young horse to which she feigned to have given birth. After Jupiter had overthrown his father, the empire of the sea fell by lot to Neptune. He is represented as being of equal dignity with his brother Jupiter, but of inferior power, though he sometimes threatened him, disputed the possession of Ægina with him, and once conspired against him. His palace was in the sea, near Eubœa, and he was the especial ruler of the Mediterranean. He assisted in building the walls of Troy, and being refused the reward promised by Laomedon, ever after bore an implacable hatred to the Trojans, and in the war against Troy sided with the Greeks, often fighting on their side, causing the earth to tremble, and encouraging them with the signs of his favor. He had power over the clouds and storms, over ships and mariners, and over all other sea divinities. He was the creator of the horse, and the teacher of horsemanship. There were many legends about him: with Jupiter he fought against Saturn and the Titans; he crushed the centaurs under a mountain in Leucosia; and he sought the hand of Thetis, but refused it through fear when Themis foretold that the son of Thetis would be greater than his father. The wife of Neptune was Amphitrite, by whom he had three children, Triton, Rhode, and Benthesicyme, besides a large number of other children by divine and mortal women. He was worshipped in Argolis, in the Corinthian isthmus, and in Ionia, and had a temple in Rome, in the Campus Martius. The sacrifices

offered to him were bulls, bears, rams, and bridled horses, and horse and chariot races were held in his honor. He had many surnames in allusion to his various attributes. In works of art his emblems are the trident, the horse, and the dolphin; and he is portrayed sometimes in a state of calm, sometimes in agitation, corresponding to the different aspects of the sea over which he presides.

NEPTUNE, the most distant known planet, and the eighth in order of distance from the sun, omitting the asteroids. Neptune travels at a mean distance of about 2,745,998,000 m. from the sun. The eccentricity of his orbit is less than that of any other in the solar system (excluding the asteroids) save that of Venus. It amounts only to 0.008720; that is, his greatest, mean, and least distances are proportional respectively to 1.008720, 1, and 0.991280. But though the eccentricity itself is small, yet the distance of Neptune is so enormous that the actual displacement of the centre of his orbit measured in miles is considerable. His greatest distance from the sun amounts to 2,771,190,000 m., his least to 2,720,806,000 m., and the linear eccentricity amounts to 25,592,000 m. As the earth's mean distance from the sun is 91,430,000 m., the distance of Neptune from the earth varies between 2,863,000,000 and 2,629,000,000 m. The inclination of his orbit to the plane of the ecliptic is $1^{\circ}47'$. He travels around the sun in a mean sidereal period of 60,126.7200 days or 164 tropical years and 226.8 days. So slow is his motion around the sun that his synodical period only exceeds a year by 2.25 days; that is to say, in the course of one year from opposition he advances through so small an arc that the earth overtakes him and he is again in opposition in 24 days. His diameter is estimated at about 37,000 m., though very little reliance can be placed on any telescopic measures of so distant an orb. His volume exceeds the earth's about 105 times; but his density (assuming his diameter to be correctly estimated) is only 0.16 of that of the earth; accordingly his mass only exceeds that of the earth about $16\frac{2}{3}$ times.—The most interesting part of the history of this planet is that which relates to its discovery, which cannot but be regarded as among the greatest triumphs of astronomy. After Uranus had been watched for about a quarter of a century, it was noticed that the path pursued by this planet was not strictly in accordance with calculations in which the perturbations produced by Jupiter and Saturn were duly taken into account. Accordingly Bouvard, the author of excellent tables of the three planets, Jupiter, Saturn, and Uranus, expressed the opinion that a planet of considerable size exists outside Uranus, and by its action on Uranus produced these perturbations. The Rev. T. J. Hussey of Hayes seems even earlier to have adopted this view, and he wrote in 1834 to Sir G. B. Airy, the present English astronomer royal, suggesting that the external planet might be detect-

ed by its action. Airy replied that he did not think the irregularity of Uranus was in such a state as to give the smallest hope of making out the nature of any external action on the planet. He expressed his belief also that there was no such action, and that the earlier observations of Uranus must have been erroneous. In 1837 and in 1842 the astronomer royal was again addressed by E. Bouvard, nephew to the Bouvard just named, and by Bessel, on the subject of an external planet, but he expressed the same opinion as before. In 1844 Prof. Challis applied to Airy for the Greenwich observations of Uranus, for "a young friend of his, Mr. J. C. Adams, who was at work on the theory of Uranus." These were sent, and in September, 1845, Challis wrote to say that "Mr. Adams had completed his calculation of the perturbations of Uranus by a supposed ulterior planet." In October, 1845, Adams left his paper with Airy, in which the place was indicated where the new planet would probably be found. Airy seems to have placed little reliance on the calculations of Adams, who in fact had then but recently taken his degree, and took no measures to verify his calculations. In June, 1846, Leverrier published his own independent calculation of the place of a disturbing planet, very nearly agreeing with the place assigned by Adams in 1845. Then Airy admitted that Adams might after all have accomplished the task which he himself had deemed beyond the power of any mathematician; and at his request Challis undertook to search for the new planet. He actually saw it, yet failed to recognize it. In the mean time Dr. Galle of Berlin had found the planet on Sept. 23, 1846. The announcement now made by Airy that Adams had anticipated Leverrier in the calculation of the place of the disturbing planet led to angry complaints from Arago and some other French astronomers. But of course no doubt exists as to the justice of the claim made, when too late, for Adams; in fact Airy admitted that "a publication of the elements of the planet's orbit obtained in October, 1845" (from Mr. Adams) "might have led to the discovery of the planet in November, 1845." The planet eventually received the name Neptune. It was found to have a distance far less than either Adams or Leverrier had hypothetically assigned to it (following Bode's law). In fact, instead of having a distance represented by 388 (where the earth's distance is 10), the actual mean distance of Neptune amounts to only 300. The motions and period of a planet at this mean distance are quite unlike those of the hypothetical planet of Adams and Leverrier; and Prof. Peirce of Harvard college published in 1848 a paper tending to show that the success of the two European mathematicians was merely a lucky accident. In one sense this was doubtless true. Fifty years hence the position of Neptune will be utterly unlike that which the hypothetical Neptune would by that time

have reached. But as the calculations of Adams and Leverrier were based on the perturbations produced by Neptune while traversing but a small portion of his orbit, and as his apparent position in that portion is nearly the same as that of the hypothetical Neptune, it does not appear that the credit due to Adams and Leverrier can be appreciably diminished. Were it not, indeed, for the lucky chance that a planet's action could explain the observed discrepancies, whether that planet moved in the actual or hypothetical orbit, neither Adams nor Leverrier could have solved the problem without first abandoning their estimate of the mean distance. But it has not been shown that in this case they would not have modified their assumption to correspond with the facts before them. An investigation of the orbits of Neptune and Uranus, with general tables of the planet's motions, has been published by Prof. S. Newcomb in the "Smithsonian Contributions to Science" (May, 1865, and October, 1873). In these papers he discusses the elements of the orbit of Neptune, the existence of an extra-Neptunian planet, the theoretical place of the planet between the years 1600 and 2000, and many other questions of great interest, with a profundity and elegance which has elicited the highest commendation. At least one satellite attends on Neptune, discovered by Mr. Lassell of Liverpool in 1847. It travels around the planet in a period of 5d. 21h. 8m., at a distance from his centre equal to 12 times his estimated radius, the maximum observed elongation of the satellite from Neptune's centre amounting to 18".

NÉRAC (anc. *Neracum*), a town of France, in the department of Lot-et-Garonne, on the Baise, 16 m. S. W. of Agen; pop. in 1866, 7,717. The new town is handsome, and larger than the older part, with which it is connected by stone bridges. Nérac contains a large church and several other public buildings, and a statue of Henry IV., who spent a part of his youth here. It has manufactures of various articles, especially corks for wine bottles. It was once the capital of the duchy of Albret, and has interesting relics of an old castle where Margaret of Navarre held her court, and where Calvin and other eminent reformers found an asylum. The former royal park now forms the promenade of La Garenne.

NERBUDDA, a river of Hindostan, which rises about lat. 22° 40' N., lon. 81° 50' E., nearly 3,500 ft. above the sea, and after a course of 800 m., generally W., through the Central Provinces, Indore, and Bombay, falls into the gulf of Cambay about lat. 21° 40' N., lon. 73° E. During the rains it rises in some places 70 ft. and in others 20 above its level in the dry season. The Nerbudda has no tributaries worthy of notice. There are extensive forests on its banks. It flows rapidly, and in Malwa its channel is worn to a great depth through columnar basalt. The upper part of its course is obstructed by numerous rapids and falls.

Near the foot of the Vindhya hills the Holkar State railway crosses the Nerbudda by means of an iron bridge 2,755 ft. long, resting on 13 brick piers.

NEREIDS, in mythology. See **NEREUS**.

NEREIDS, the name of the sea centipedes of the dorsibranchiate order of annelids, of which the genus *neréis* (Cuv.) is one of the best known forms. The class and ordinal characters are given under **ANNELIDA**. In the true nereids the tentacles are of even number; there is a single pair of maxillæ in the proboscis; the branchiæ are small plates in which a network of blood vessels is disposed; each of the numerous feet has two tubercles, two bundles of bristles, and an under and an upper cirrus; the body is like that of a centipede, with many joints. They are active, crawling and swimming with facility; some live in crevices in rocks near the shore, in sponges, corals, deserted shells under stones, or wherever they can find a shelter; others burrow in mud or sand, occasionally making tubes or sheaths, from which they protrude the anterior part of the body, and into which they retreat quickly when alarmed; some of the tropical species

Common Sea Mouse (*Aphrodita aculeata*).

are very large, and vividly phosphorescent at night. Their food consists of living and dead animal substances, such as marine worms and soft-bodied invertebrates. The species are numerous, and are found on almost all coasts.—The sea mice (*aphrodita*, Linn.) belong to the same order; the body is broad and flat, with two longitudinal rows of wide membranous scales covering the back and concealing the branchiæ. The common sea mouse (*A. aculeata*, Linn.) is 6 or 7 in. long and 2 broad, the back covered with a flax-like substance in which are mixed spines and softer bristles, the latter shining with all the tints of the rainbow, and rivalling in beauty the lustre of the humming bird or the sparkling of the most brilliant gems.

NEREUS, a marine divinity in Greek and Roman mythology, son of Pontus and Gæa (or, in the Roman myth, of Oceanus and Terra), and husband of Doris, who bore him 50 daughters, the Nereids. Nereus was represented as a benevolent, wise, and gentle old man, one of the most unerring prophets among the minor divinities. He dwelt at the bottom of the sea (according to most authors, of the Ægean sea,

over which he especially ruled). His attribute was the trident, and he frequently appears in ancient works of art.—The Nereids were the nymphs of the Mediterranean, as the Naiads were of the fresh water, and the Oceanides of the outer ocean. Their individual names are given by several authors, but are not always the same in different passages. They were represented as beautiful girls, generally grouped about the cars of marine divinities, or in dances or revels with tritons and monsters; sometimes they are represented as mermaids. They were thought to be especially propitious to sailors, and were widely worshipped in the Greek seaports. Perhaps the most celebrated of the Nereids was Thetis, the wife of Peleus and mother of Achilles.

NERI, Filippo de' (commonly called in English St. PHILIP NERI), a saint of the Roman Catholic church, born in Florence in July, 1515, died in Rome, May 26, 1595. He was the adopted heir of a rich uncle, but secretly left his house and went to Rome, and while fulfilling there the duties of tutor studied philosophy, theology, and canon law. In 1538 he sold all that he possessed, distributed the proceeds among the poor, and devoted himself to serving the sick in the hospitals and the pilgrims who flocked to Rome. He founded, with the help of Ignatius Loyola, a guild of nobles, to provide hospitality for pilgrims, and obtain lodging and work for destitute young people. In June, 1551, he received holy orders, took up his abode in the monastery of San Girolamo, and gave his whole time to instructing youth and children. Several young clerics joined him in this labor, and stationed themselves each morning and evening on Sundays and festivals before the door of some church, rang a bell to attract the crowd, sang psalms and hymns, or persuaded people to enter the chapel. To make these assemblies more attractive, he invited the most eloquent men to preach, and the best singers and musicians volunteered their services. He had dramas, with music, on Scriptural subjects, performed in an adjoining monastery. The efforts of the guild were next directed to securing permanent employment for the reclaimed. The aid of such companions as Baronius and Salviati, afterward cardinals, enabled Philip to found a society of priests, called from their prayer meetings and sacred concerts "the Priests of the Oratory," which soon had branches in many cities. This foundation was approved by Gregory XIII. in 1575. (See ORATORIANS.) Philip was canonized in 1622 by Gregory XV., and his feast is celebrated on May 26. His literary remains consist of letters, poems, and advice to youth.—See F. W. Faber, "Spirit and Genius of St. Philip Neri" (London, 1850).

NERIUM. See OLEANDER.

NERO, a Roman emperor, born at Antium on the coast of Latium, probably Dec. 15, A. D. 37, died by his own hand, June 9, 68. He was the son of Cneius Domitius Ahenobarbus,

by Agrippina, the sister of Caligula, and his original name was Lucius Domitius Ahenobarbus. When he was 12 years of age his mother married her uncle the emperor Claudius, who four years afterward gave his daughter Octavia to Nero in marriage, having formally adopted him under the name of Nero Claudius Caesar Drusus Germanicus. Under the care of the philosopher Seneca he is said to have made some progress in learning, and in his 16th year he delivered an oration in Greek in behalf of the inhabitants of Ilium and Rhodes. In 54 the murder of Claudius by Agrippina placed him on the throne, his mother causing the emperor's death to be kept secret until he could be safely proclaimed by the soldiers. The senate and the provinces at once submitted to him, and no attempt was made to secure the purple for Claudius's own son Britannicus, who was four or five years his junior. The first five years of his reign were distinguished for clemency and justice, though his private life was from the first extremely licentious. The conduct of affairs was left principally to Seneca and Burrhus, under whose influence many reforms were introduced into the state, and Nero daily rose in popularity; but the jealousy of Agrippina, who found herself shut out from power, soon overthrew the ascendancy of Seneca, though it did not establish her own. She threatened to disclose the circumstances of Claudius's death, and to incite the legions to support the claims of Britannicus; she abused Nero and upbraided him for his disgraceful amour with a low-born woman named Acte. Nero retaliated by causing Britannicus to be poisoned, and by plunging into still lower depths of immorality. In company with other dissolute young men he roamed the city by night, beating and robbing passengers and breaking into houses. One of his boon companions was Otho, with whose beautiful but profligate wife Poppæa Nero became enamored, and sent Otho to Lusitania to get him out of the way; but Poppæa, who aspired to share the imperial throne, encountered in Agrippina an enemy who thwarted all her plans. Persuading the emperor that his mother entertained designs upon his life, she finally procured an order for her assassination (59), and her death was communicated to the senate by Seneca, who was an accomplice in the crime. (See AGRIPPINA.) This was followed by the divorce of Octavia, who was soon afterward put to death, and the marriage of the emperor to Poppæa. In 62 Burrhus died, and Seneca wisely asked leave to retire. Two years afterward a dreadful conflagration raged in Rome for a week, totally destroying three of the 14 districts of the city, and leaving only a few half-ruined houses in seven of the others. Dion Cassius and Suetonius relate that Nero fired it himself, and it is said that, as he watched the progress of the flames from the top of a high tower, he amused himself with chanting to his own

lyre verses on the destruction of Troy. The truth of the story is doubtful, but it was believed at the time, and Nero sought to transfer the odium of the conflagration to the Christians, many of whom he caused to be put to death. Some were covered with the skins of wild beasts and torn to pieces by dogs, and others were crucified and set on fire by night in the imperial gardens, while the emperor drove his chariot by the light of the flames. The tyrant was liberal to the sufferers by the conflagration, and upon the ruins of the old city built a much finer one on a different plan, one of its most striking features being a vast palace for himself, which was called "the golden house," and the cost of which he defrayed by robbery and extortion. The discovery of a conspiracy against him served to develop his ferocity. O. Calpurnius Piso, Plantius Lateranus, the poet Lucan, and Seneca were put to death for alleged complicity in it. The senate was induced to receive the intelligence of their fate as the news of a great victory, and triumphal honors were decreed to the infamous Tigellinus, the emperor's principal instrument. Having killed Poppæa by a kick when she was with child, Nero now proposed to marry Antonia, his sister by adoption, and on her refusal ordered her to be put to death. He then bestowed his hand upon Statilia Messalina, whose husband Vestinus he had assassinated for marrying Messalina after the emperor had cohabited with her. The jurist Longinus was exiled, and the most virtuous citizens were put to death. In the midst of these executions Nero's highest ambition seemed to be to excel in the games of the circus. He visited Greece to display his skill as a musician and charioteer, and the Olympic games were delayed two years (from 65 to 67) that he might be present at them. At the Isthmian games he ordered the death of a singer whose voice overpowered his own. He returned to Rome as a conqueror, entering the city through a breach in the wall, riding in the chariot of Augustus, with a musician by his side, and the 1,800 crowns which he had won at the games displayed as the trophies of his expedition. He had already appeared upon the stage in Rome and other cities of Italy, and chariot racing, music, and every frivolous amusement now engrossed his time. But in the mean while a formidable insurrection was preparing. It broke out in Gaul, under Julius Vindex, governor of the Celtic province, who raised an army and offered the purple to Galba, then governor of Hispania Tarraconensis. Galba accepted the proposal, but the troops of Vindex were defeated before Vesontio (Besançon), and their general was killed. There is little doubt that Galba would have yielded had not Nero, who had reluctantly left his extravagances in Naples to assume the consulship alone at the capital, been deserted by the prætorian guard, condemned to death by the senate, and forced to flee to the house of one of his creatures in the suburbs. Here, after spending in

an agony of fear and irresolution the night and part of the next day, he committed suicide, and died in the presence of the soldiers who had come to seize him. His corpse received an honorable burial from his concubine Acte and two of his nurses.—The military events of Nero's reign were upon the whole glorious to the Roman arms. In Armenia, which had been occupied by the Parthians, a war commenced in 55, and was terminated in 58 by Domitius Corbulo, who destroyed Artaxata, the capital, and captured the city of Tigranocerta, thus rendering the Romans masters of the whole country. Tiridates, the king, who had been set up there by the Parthians, subsequently renewed the struggle, and after temporary successes was compelled to submit and go in person to Rome to do homage for his kingdom. Nero, however, soon afterward condemned Corbulo to death, a sentence which the old soldier anticipated by suicide. In 61 a great rising in Britain under Boadicea was put down by Suetonius Paulinus. A revolt also broke out in Judea, and Vespasian was sent to suppress it; but the history of this war, terminating with the conquest of Jerusalem, belongs to subsequent reigns.

NEROLI. See **ORANGE**.

NERTCHINSK, a town of eastern Siberia, in the province of Transbaikalia, about 530 m. E. of Irkutsk; pop. in 1869, 3,938. The military post of Nertchinsk commands the frontier of China. It is situated on low ground, subject to inundation. Most of the houses are built of wood. It contains churches and schools, and has an extensive fur trade. The first boundary treaty between Russia and China was concluded here in 1689.—The celebrated Nertchinsk government mines are situated 100 m. E. of the town, in the Nertchinskoi mountains. More than 4,000 persons were in former years employed in the silver mines alone. Lead, tin, cinnabar, and zinc mines also exist, and gold was largely produced in the years 1846-'56.

NERVA, Marcus Cocceius, a Roman emperor, born probably in Narnia, Umbria, A. D. 32, died in Rome, Jan. 23, 98. He was twice consul before his accession to the purple, in 71 with Vespasian, and in 90 with Domitian. On the assassination of Domitian, in September, 96, Nerva was proclaimed emperor by the people and soldiers. He discontinued Domitian's prosecutions for treason, discountenanced informers, permitted exiles to return, distributed land among the poor, and made occasional donations of money and corn. By suppressing many public shows and festivals, and diminishing the expense of such as were tolerated, he economized the revenue, and increased the resources of his empire. In the second year of

his reign a conspiracy was formed against him, at the head of which was a descendant of the triumvir Crassus. It was discovered in time; but Nerva having sworn, when accepting office, that no senator should suffer death under his rule, the leader was only banished to Tarentum and the other conspirators were pardoned.

NERVAL, Gérard de. See GÉRARD DE NERVAL.

NERVE (Gr. *νεῦρον*, a string or sinew), a white cord-like bundle of filaments, distributed to sensitive or contractile organs of the body, and capable of transmitting the nervous influence; so called because the Greek anatomists, misled by the aspect of the nerves proper, did not distinguish them from the tendons. Externally a nerve is white and glistening, and of consider-

FIG. 1.—Transverse Section of the Ischiatic Nerve.

a. Neurilemma. b. Internal Fibrous Partitions. c. Bundles of Nervous Filaments, cut across.

able toughness and consistency. These qualities are due to its being covered everywhere with a layer of white fibrous tissue, of the same kind as that of the tendons and ligaments, which serves to support the softer parts within and protect them from injury. This protective investment is termed the *neurilemma*. It sends everywhere longitudinal partitions into the interior of the nerve, in which are contained the small blood vessels destined to nourish its tissue, dividing it into a number of parallel passageways or channels, of a nearly cylindrical form. In these channels are contained the nervous filaments or nerve fibres, the essential anatomical elements of the nerve. They are cylindrical filaments, averaging in the main trunks and branches $\frac{3}{1000}$ of an inch in diameter, and consisting of a fine structureless investing membrane, a layer of semi-fluid, transparent, highly refracting substance, the "medullary layer," and a central, soft, faintly granular mass, the "axis cylinder." They are similar to the nerve fibres in the brain and spinal cord (see BRAIN), except that they are larger in size, and are invested by the fibrous neurilemma, which is wanting in the interior of the nervous centres. The presence of the highly refracting medullary layer gives to each filament a distinctly marked double contour, which renders it easily distinguishable under the microscope. The filaments in the interior of the nerve are thus arranged in parallel bundles, each bundle surrounded by its own layer of white fibrous tissue, and the whole surrounded and strengthened by the external investment of neurilemma. As the nerves, after originating from the brain or spinal cord, pass outward toward the organs

to which they are to be distributed, they divide into smaller and smaller branches, and sometimes send to each other reciprocal branches of communication, thus forming nervous plexuses, which have received distinct names, corresponding with their location. Thus we find the cervical plexus in the neck, and the brachial plexus, from which are given off the nerves going to the arm. But in these cases the branching and intermingling of the nerves is only apparent, and is simply due to the separation of certain bundles of filaments from those with which they were previously associated, and their passing off in a different direction. The nervous filaments themselves do not in these instances split up or lose their identity. But when a nerve has finally reached the organ in which it is to be distributed, and when by successive ramification its branches have become reduced to a few filaments each, these filaments themselves divide and multiply, perhaps several times in succession, and often without diminishing very perceptibly in size, although at the point of division they usually exhibit a well marked constriction. The nervous filaments finally terminate by free extremities, both in the muscular and sensitive

FIG. 2.—Division of Nervous Filaments, from one of the Cutaneous Muscles of the Frog, magnified 350 times.

tissues. In the voluntary muscles the terminal extremity of a nervous filament becomes attached to a muscular fibre, its investing tubular membrane becoming continuous at the point of junction with the sarcolemma, its medullary layer disappears, and its axis cylinder spreads out upon the surface of the contractile substance of the muscular fibre, in the form of a thin, granular, oval spot. In the skin and sensitive membranes generally the ultimate nervous filaments end in minute rounded or ovoid masses termed tactile corpuscles, within which they lose, as in the case of the muscular nerves, their investing membrane and medullary layer, and become reduced to the axis cylinder alone,

which is usually terminated by a slightly rounded extremity.—Nerves are divided into motor and sensitive, according to the preponderance of the two kinds of nervous filaments in their tissue, and whether they are distributed to muscular or sensitive organs. A nerve distributed to muscles is a motor nerve, and its irritation produces a muscular contraction; one distributed to the integument is a sensitive nerve, and its irritation causes a painful sensation. Thus the seventh pair of cranial nerves, or the facial, belongs to the motor nerves, and animates the superficial muscles of the face. The fifth pair, on the contrary, belongs to the sensitive nerves, and communicates sensibility to the integument of that part of the body. In point of fact, however, but few if any of the nervous trunks are exclusively motor or exclusively sensitive, since they generally receive filaments of both kinds, either from their own roots or from other neighboring nerves. Thus the facial nerve has a certain degree of sensibility, which it derives from communications with the fifth pair; and one portion of the fifth pair itself is motor in character, and animates the muscles of mastication. When both kinds of filaments are mingled together in a nerve in similar or nearly similar proportions, it is said to be a “mixed nerve,” and is at the same time motor and sensitive. This is the case with all the spinal nerves, the branches of which are distributed both to the muscles and the integument of the body and limbs.—When cut across, a nerve at once ceases to perform its functions. It can no longer transmit the nervous influence in either direction, and accordingly the parts to which it is distributed become paralyzed and insensible. The nerve may however reunite after such an injury, and its natural functions thus become reestablished. The substance may even be regenerated when a considerable portion has been cut out. This reunion and regeneration of divided nerves takes place most readily in young animals. Vulpian has found the sciatic nerve regenerated, in very young rats, after the excision of a little more than two inches of its length, in 17 days; and in young cats sensibility has returned in the tongue, after excision of one inch of the lingual nerve, in 14 days. In adult animals, however, and in the human subject, a longer time is required for the regeneration of a divided nerve; and the full restoration of its function is often not complete until after the lapse of several months. (See NERVOUS SYSTEM.)

NERVE CELL, a form of animal cell found in the gray nervous matter of the nervous centres (see GANGLION), and also in the peripheral expansion of some of the cranial nerves. Nerve cells are rounded or ovoid-shaped bodies, often with slender, elongated, tapering or branching processes extending from their periphery in various directions. They vary in size from $\frac{1}{4000}$ to $\frac{1}{800}$ of an inch in diameter. They consist of a soft granular substance, usually containing a

considerable quantity of gray pigment, and a well defined round or oval nucleus, with a large and distinct nucleolus. Their branching processes often become continuous with the ul-

Nerve Cells from the Retina of the Ox, magnified 850 times.

mate nerve fibres, which are mingled in profusion with the nerve cells in the gray substance of nervous centres. They are regarded as the most important anatomical elements of the nervous centres, where nervous power originates, or the nervous impressions are finally received.

NERVII, an ancient people, one of the most warlike tribes of Belgic Gaul. Their territory extended from the Sambre to the ocean, and was partly covered by the Ardennes. Bagacum (Bayay) was their capital, and Camaracum (Cambrai) one of their towns. They claimed a Germanic origin. They joined the Belgic league against Cæsar, and, though numbering 60,000 men capable of bearing arms, were almost annihilated by him (57 B. C.).

NERVOUS SYSTEM. One of the most important and remarkable characteristics that distinguish the physical organization of animals from that of plants, is the existence in the former of a peculiar tissue or substance called nerve. The special endowment of this substance is what is termed sensibility, or that faculty by which an animal is capable of receiving impressions from external objects, and by which consequently it is brought into relation with the surrounding world. In most animals this tissue is so disposed as to form a distinct and complete apparatus called the nervous system. Its development is always in direct relation to the complexity of the physical organization and the degree of physical endowment. In the lowest forms of animal creation the existence of nervous matter is as yet undemonstrated, but it no doubt exists in many species where it has not yet been discovered, owing to the delicacy of its tissues and the imperfect means of observation. The tissue out of which the

nervous system is constructed presents two varieties, described by anatomists as the white or fibrous matter, and the gray, cineritious, or vesicular matter. The white matter is developed in the form of fibres or filaments, bound together in fasciculi or bundles, which constitute what are called nerves; their function is internuncial or conducting. The gray matter is accumulated in masses called centres or ganglia; their office is dynamic, originating the so-called nervous force. (For a more particular description of the microscopical anatomy and chemical analysis of nerve tissue, see BRAIN.)—Examining the nervous system in its comparative development in the animal creation, we find four principal types exhibited in the four great classes radiata, mollusca, articulata, and vertebrata. We will briefly examine these in succession. 1. *Nervous System of Radiata*. In this class we find the simplest form of nervous system, and one which corresponds with the simplicity of the physical organization, the animal being formed by a series of similar parts. Thus in the *asterias* or five-rayed star fish we have a chain of five ganglia surrounding the central mass, or body which contains the mouth and digestive cavity. These ganglia are united to each other by nervous arcs called commissures, and each sends into the ray or limb opposite to which it is placed nervous prolongations. 2. *Nervous System of Mollusca*. In these animals we have several separate and distinct organs, such as a digestive apparatus, a liver, gills, ovaries, and testicles, the male and female functions generally coexisting in the same animal; we have besides a muscular mantle and a foot or organ of locomotion. The necessities of this physical organization are met by a corresponding arrangement of the nervous system. Thus in *aplysia* there is an anterior or cerebral ganglion resulting from the junction of two above the œsophagus; this ganglion represents the brain, and is doubtless connected with whatever sensitive or volitional endowment the animal possesses. From this small nerves pass to form the pharyngeal ganglion, which supplies innervation to the digestive apparatus; from this two nerves pass backward to form the pedal ganglion, which also gives nerves to supply the mantle; and in the posterior part of the body there is an additional ganglion, called the branchial, the nerves of which are distributed to the gills. 3. *Nervous System of Articulata*. In this class we observe that the body is divided into a certain number of similar segments, of which the anterior, called the head, presents the greatest development. The nervous system in this class corresponds to their anatomical structure. Thus in the common centipede, *scolopendra*, the nervous system consists in a double nervous cord running along the ventral surface of the animal, and presenting opposite to each articulation ganglionic enlargements; these ganglia

send off lateral prolongations, which unite with each other on the upper surface of the body, forming a series of circular commissures. At the head there is a ganglion at the point of junction of the lateral prolongations from the infra-œsophageal ganglia, called the supra-œsophageal ganglion, and from this ring or collar arise the optic nerves and the other nerves that are distributed about the head. In insects we find a somewhat more complicated arrangement of the same type of nervous system, and one which presents very important analogies to the nervous system of the vertebrata. It consists in a ganglionic nervous cord, but the ganglia are arranged so as to correspond with the anatomical division of the animal into three distinct cavities, the head, chest, and abdomen. In the head we have the ganglia presiding over the functions of special sense, prehension, and mastication; in the chest those that control respiration and the locomotive organs, the legs and wings; and in the abdomen those that are connected with the digestive and reproductive functions. 4. *Nervous System of Vertebrata*. The nervous system, as we find it developed in the mammalia, the last and highest class of the vertebrata, consists of an axis of nerve matter, called the cerebro-spinal axis, which is enclosed in the cavities of the cranium and spinal canal. This axis is constituted of ganglia and of longitudinal and transverse commissures, and gives off nerves which are distributed to the organs of special sense, of ordinary sensation and motion. This cerebro-spinal axis, however, with its centres, commissures, and nerves, forms but one portion of the nervous system in the ver-

tebrata, that which presides over the purely animal functions of locomotion, respiration, sensation, and intelligence. A separate and distinct system, called the ganglionic or sympathetic, controls the functions of organic or

vegetative life; its centres are located in the visceral cavities of the body; they are connected with each other by longitudinal and transverse commissures, and send filaments to all the viscera. The cerebro-spinal axis, as it is developed in man, may be briefly described as follows. The principal ganglion is placed at the superior extremity of the axis, and is called the brain or encephalon. This is enclosed in the cavity of the cranium, and is enveloped by three membranes, the pia mater, the arachnoid, and dura mater. The encephalon consists of a series of ganglia connected with each other, and designated, counting from before backward, as: 1, the olfactory ganglia; 2, the cerebrum or hemispheres; 3, the corpora striata; 4, the optic thalami; 5, the tubercula quadrigemina; 6, the cerebellum; 7, the ganglion of the tuber annulare; and 8, the ganglion of the medulla oblongata. The cerebrum and the cerebellum present a convoluted surface; the others are smooth and irregularly rounded. The superior aspect of the brain presents a deep longitudinal fissure, which divides the cerebrum into two lateral halves, called the cerebral hemispheres; these hemispheres, however, are united at their middle by a transverse commissure, designated as the corpus callosum. Upon its inferior surface each hemisphere is seen to be divided into an anterior, middle, and posterior lobe. The remainder of the axis, called the spinal cord, is a cylinder of nerve matter, extending through the entire length of the vertebral canal, where it is enveloped by a prolongation of the membranes of the brain. Upon the anterior and posterior aspects of the spinal cord are two longitudinal fissures, which indicate the two lateral halves of which the organ is composed. From the brain and spinal cord there arise 44 pairs of nerves, perfectly symmetrical in their course and distribution. These nerves are distinguished as cranial and spinal.

The Spinal Cord and Nerves, posterior view.
a. Upper extremity of spinal cord. b. Lower extremity. c. Cervical portion. d. Dorsal portion. e. Lumbar portion.

The cranial nerves, of which there are 12 pairs, are distributed mainly to the organs of sense, and to those of respiration, voice, and speech; they emerge from the skull by the several openings at its base. The spinal nerves, of which there are 32 pairs, arise from the cord by two roots, one from the anterior and the other from the posterior portion. They escape from the spinal canal through the intervertebral openings, and are distributed principally to the voluntary muscles and the integuments of the neck, body, and extremities. The cerebro-spinal axis, or the nervous system of animal life, as it is called in contradistinction to the sympathetic system, or that of organic life, presents certain peculiarities in the several classes of vertebrata which deserve to be briefly mentioned. As we descend in the series of vertebrate animals, we are struck with the difference in the relative size and development of the brain and spinal marrow. The annexed table will show the proportion which the one bears to the other in weight in the four classes:

CLASS.	SPECIES.	Proportion of	
		brain	to spinal marrow.
Pisces.....	Lamprey.....	100	: 750
Reptilia.....	Triton.....	100	: 180
Aves.....	Pigeon.....	100	: 80
Mammalia.....	Mouse.....	100	: 22

The following table shows the relative proportions of the body and brain in the same classes:

CLASS.	SPECIES.	Proportion of	
		brain	to body.
Pisces.....	Lamprey.....	100	: 142,500
Reptilia.....	Turtle.....	100	: 454,500
Aves.....	Pigeon.....	100	: 9,100
Mammalia.....	Mouse.....	100	: 8,500

This diminution in the size of the brain in the lower vertebrata is observed chiefly in the cerebral hemispheres, the centres of the intellectual faculties. A few words will describe some of the more important anatomical differences in the cerebro-spinal axes of the three lower classes of vertebrata. The brain of birds presents a perfectly smooth surface, and is composed of six masses, viz., beginning anteriorly: the two lateral hemispheres, the optic tubercles, the cerebellum, and the medulla oblongata. The cerebellum is compressed laterally and convoluted transversely. The brain of birds has in common with reptiles and fishes certain peculiarities never observed in the brain of mammalia. They are: 1, the absence of the corpus callosum or transverse commissure of the cerebral hemispheres; 2, the separation of the optic tubercles from the hemispheres; and 3, the existence of two ventricles in the optic tubercles. In reptiles, as in birds, the brain is without convolutions. The optic tubercles, instead of being smaller, are sometimes larger than the cerebral hemispheres, and placed as usual behind them. The cerebellum is behind

the optic tubercles, and is generally small. The olfactory nerves are apparently continuous with the anterior or cerebral ganglia. The brain of fishes is composed of lobes placed one behind the other so as to form a sort of knotted cord. The optic tubercles, called also *tubercula quadrigemina*, and the cerebellum, are placed behind the cerebral ganglia, and are larger in proportion to the latter than in reptiles. The spinal cord differs essentially in the different classes of vertebrata only in the number of pairs of nerves which arise from it, this number being always proportioned to that of the vertebrae.—*Functions of the several parts of the Nervous System.* The first question that meets us in this inquiry is: What are the vital endowments of nerves and nervous centres? When we expose and irritate a nerve by chemical, mechanical, or electrical stimulus, we observe no visible change in the nerve itself, but we produce indications of pain and contraction of the muscles to which the nerve is distributed. We infer therefore from the effects of the irritation that it has produced some change in the nerve, or excited in it some vital endowment. This change has been compared to that wrought in a piece of malleable iron by the galvanic current; and the analogy has suggested the term polarity or polar force, as applicable to the condition produced in nerves by the application of a stimulus. This property of nerves, by which they respond to external irritation, producing pain or muscular contraction, is called irritability; and one of its most remarkable characteristics is the instantaneousness with which the effect follows the irritation. This irritability or nervous force, as it is also called, can be excited at the centres and extremities as well as in the course of the nerves. The effects of irritation vary considerably, however, in different parts of the nervous system. There are certain ganglia and nerves, the irritation of which produces effects that are entirely peculiar to themselves. Thus, irritation of the optic tubercles or nerves causes the sensation of light, irritation of the auditory nerve gives rise to the sensation of sound, and irritation of the olfactory and gustatory nerves to the sensations of smell and taste. This difference in the effects produced by the irritation of different nerves is the basis of the division of the nerves into: 1, motor nerves, or those in which irritation produces muscular contraction; 2, sensitive nerves, or nerves of common sensibility, in which irritation is followed by an agreeable or painful feeling, according to the nature or degree of the stimulation; and 3, nerves of special sense, in which irritation excites the peculiar sensations of light, sound, taste, &c. Many sensitive nerves arise from nervous centres in such close proximity to motor nerves, that a stimulus applied to the former will react upon the latter, and produce not only a direct sensation, but what is technically called a reflex action. This property of reflection was supposed by Mar-

shall Hall to reside in special nerves which possessed both an incident and a reflected fibre, or, as they are called, an afferent sensitive nerve leading to the centre, and an efferent motor nerve coming from the centre; these nerves he styled excito-motory. Probably the majority of all the nerves in the body are compound in their constitution; *i. e.*, they are formed of sensitive and motor filaments combined in the same sheath, or fibrous covering, called the neurilemma. There is no appreciable difference to the eye in the structure of sensitive and motor nerves. The difference in their endowments can only be ascribed, in the present state of our knowledge, to the different nature of their central or peripheral connections. It is a remarkable fact that whatever part of a sensitive nerve be irritated, whether it be the centre, the middle, or the extremity, the same sensation will be produced. There are many familiar illustrations of this fact. For years after the amputation of limbs, patients will experience the sensation of fingers and toes; and when the trunk of a nerve is irritated, they will complain of pains or tingling in the extremities. The same law applies to nerves of special sense. Ordinarily their peculiar irritability is excited by stimuli applied to the periphery or ultimate distribution of the fibres; but occasionally, in consequence of disease, we have these special sensations caused by stimulation applied at the centre or origin of the nerves. Thus, disturbance of the circulation in the brain, or the existence of tumors or other local disease in the neighborhood of the centres of the nerves of special sense, gives rise to optical illusions, singular noises, disagreeable odors, &c. The stimuli that excite the nervous force or irritability are of two kinds, physical and mental. Physical stimuli embrace all external excitants of whatever nature—light, heat, sound, odor, and every variety of chemical, mechanical, and galvanic irritant. Mental stimuli result from the exercise of the will and thought. In all voluntary movements the mind is the direct stimulus of the motor nerve; and in certain deranged states of the nervous system, as in hysteria, the mind also seems to affect directly the nerves of sensation so as to excite pain. Motor nerves are never directly excited by physical stimuli. The latter act always on motor nerves through the medium of sensitive nerves, and, as before stated, the actions so produced are termed reflex actions. The most remarkable of the physical stimuli, and the one most analogous in its effects to the stimulus of the will, is galvanism. The effect of this stimulus is muscular contraction, and there are certain peculiarities in its mode of action that are worthy of mention. 1. If the current be made to cross a nerve at right angles to it, no effect is produced; but if it be made to pass along the fibre, for the smallest fraction of an inch, it will excite more or less violent con-

traction of the muscles to which the nerve is distributed. 2. These contractions occur at the moment of making and breaking the current, and not while it is passing. 3. When the current is made to pass from the centre toward the periphery, it is called the direct current; when from the periphery toward the centre, the inverse current; and it is observed that contractions occur at the moment of making the direct current, and at that of breaking the reverse. 4. Continuance of the direct current exhausts the power of the nerve, but the reversal of the current will restore it; hence the value of the interrupted current, obtained from the electro-magnetic machines, as a remedial agent.—*Nature of Nervous Force.*

We can judge of the nature of the nervous force only by its effects. The muscular contraction caused by the irritation of a nerve is due to the development of a peculiar vital force in the nerve structure, which is unlike any of the known physical forces. It bears certain analogies to electricity, and by some authors has been supposed to be identical with it. The reasons for this supposition are: 1, the identity of their effects on muscular fibre; 2, the rapidity of their action without producing any appreciable effect on the parts between the point of irritation and the point affected; 3, the extreme sensibility of nerves to the electric current; and 4, the phenomena of electrical fishes. None of these reasons are sufficient to establish the identity of the nervous and electrical forces, while the experiments of Longet, Matteucci, Prévost, Dumas, and others, showing that the more delicate tests can detect no galvanic current in the nerves, and that they are inferior to some other substances as conductors, prove conclusively that they are essentially distinct and different forces. With regard to the indisputable electrical phenomena that are observed in the torpedo and gymnotus, it is well ascertained that they depend on the existence in these animals of a special organ which generates electricity. The function of nerves, as has been remarked, is internuncial. They possess only limited capacity for the development of nervous force. Their office seems to be to conduct sensations from the periphery to the centre, and impulses from the centre to the periphery. Their connection with a centre is essential for the appreciation of external impressions or the exercise of mental stimulus. The determination of the sensitive or motor character of a nerve is effected by direct experiment on living animals, and by the effects of disease or injury of the nerves. The different properties belonging to the two roots of the spinal nerves were discovered by Sir Charles Bell about 1810, and established by Magendie in 1822. Magendie operated by dividing, in the living animal, first, the posterior roots of the lumbar and sacral nerves, after which sensibility was lost in the corresponding limbs, while the power of motion remained; secondly, the anterior roots only, after which the

power of motion was abolished, but sensibility remained; and finally, at the same time both anterior and posterior roots, after which motion and sensibility were alike destroyed. These experiments have been repeated by numerous observers, and the conclusion is established that the anterior root of each spinal nerve is motor and the posterior sensitive. (For a description of the functions of the encephalic nervous centres and the cranial nerves, see BRAIN.)—*Functions of the Spinal Cord.* The spinal cord consists of two anterior and two posterior columns made up of longitudinal nerve fibres. Each lateral half encloses a crescentic mass of gray vesicular nerve matter. The fibres of the spinal nerves originate from the gray matter within the cord, while others extend longitudinally through the cord, and are connected, either directly or indirectly, with the brain. The discovery of the separate function of the roots of the spinal nerves was the first step in unravelling the important offices of the spinal cord. Experiments on living animals have established the following points in its physiology: 1. That the anterior and posterior columns of the cord correspond in their properties to the anterior and posterior roots of the spinal nerves; for when the anterior column is irritated, convulsive motion is produced in the parts below the point of division; and when the posterior column is irritated, a painful sensation is produced. 2. When the anterior and posterior columns are both divided, it is found that irritation of the portion of the anterior column attached to the brain produces no effect, while irritation of the lower segment causes convulsive action, showing that in the anterior column the nervous force travels from within outward and not from without inward. When, on the other hand, the portion of the posterior column attached to the brain is irritated, pain is produced, while irritation of the portion below the division causes no pain, showing that in the posterior column the nervous force travels from without inward and not from within outward. 3. The motor nerves derived from the right side of the body enter the right lateral half of the cord, and make their connections from below upward on the same side until they reach the medulla oblongata, where they cross over to the left side; the same course is followed by the motor nerves of the opposite side, which pass up the left anterior column till they reach the medulla, when they cross to the right side. This crossing of the motor nerves in the anterior columns of the medulla is termed decussation. The consequence of this arrangement is, that when an injury is inflicted on the right half of the anterior column below the medulla oblongata, the paralysis is on the same side; but when the injury is above the point at which decussation commences, the paralysis will be on the opposite side. 4. The experiments of Dr. Brown-Séquard show that there is a crossed action in the sensitive as well as in the

motor fibres of the cord. The decussation of the sensitive fibres, however, exists through the entire length of the spinal cord, and not in the medulla alone, as in the anterior columns. The effect of this is shown when one lateral half of the spinal cord of a dog is divided; sensation remains on the corresponding side of the body, but is lost on the opposite side.—*Reflex Action of the Spinal Cord.* Thus far the spinal cord has been considered as a bundle of sensitive and motor nerves connecting the brain with the muscles and periphery of the body; but we find that the central portion of the cord contains a considerable amount of gray matter, and that it possesses in consequence the capacity of a nervous centre. When a frog has been decapitated, sensation and volition are of course destroyed, the communication between the body and the centres in which these powers reside being cut off; but it will be found, nevertheless, that irritation of either lower or upper extremity will be followed by muscular contraction on the corresponding side; and when the irritation is excessive, contractions will occur in all the limbs. These phenomena, which are due to the action of the cord as a nervous centre, are not unfrequently observed as a consequence of disease or injury of the spinal cord. Whenever communication is cut off between any portion of the cord and the brain by disease, such as softening, or by fracture of the spine, sensibility and the power of motion are lost in the parts below the point of disease or injury; but involuntary and uncontrollable contractions occur in response to any irritation applied to the surface, such as tickling of the soles of the feet, a draft of air, or the application of the galvanic current. For the production of these reflex phenomena it is necessary: 1, that the cord be in a state of integrity; and 2, that the continuity of the spinal nerves be unbroken. If the spinal cord be broken up in the frog by the passage of a needle through the spinal canal, irritation of the extremities will produce no effect; and if the sciatic nerve, for example, be divided, the cord remaining perfect, no contraction can be produced on the side of the division. It is inferred then from direct experiments and from the evidence furnished by disease that the spinal cord is a nervous centre, which supplies innervation to the muscular and cutaneous systems through the medium of sensitive and motor filaments; the sensitive filaments conveying impressions from the surface to the centre, and the motor filaments transmitting impulses from the centre to the surface.—*Sympathetic or Ganglionic System.* This system, which is sometimes called the nervous system of organic life, consists in a double chain of nervous ganglia occupying the visceral cavities of the body, and extending along the front and sides of the vertebral column from its anterior to its posterior extremity. There are four symmetrical pairs of ganglia in the head, three pairs in the neck, ten pairs in the chest, an irregular aggregation of ganglia in the abdo-

men called the semilunar ganglion, and five pairs in the pelvis. These ganglia are all connected with each other by transverse and longitudinal commissural fibres, and they send off some filaments to join nerves from the cerebro-spinal system, and others to be distributed to all the viscera which are concerned in the maintenance of organic or purely vegetative life. The state of knowledge concerning the special properties and functions of the sympathetic system of nerves is less advanced than that which relates to the cerebro-spinal system. The reasons for this imperfect knowledge are, the difficulties of experimenting on this system from the peculiarities of its situation, and the very complex connections of the sympathetic and cerebro-spinal systems.—For further information, see Longet, *Anatomie et physiologie du système nerveux* (1842), and *Traité de physiologie* (1850-'70); Mayo "On the Nervous System" (1842); Carpenter, "Principles of Human Physiology" (1846; 7th ed., 1869); Todd's "Cyclopædia of Anatomy and Physiology;" Todd and Bowman, "Physiological Anatomy and Physiology of Man" (1850); Bernard, *Leçons sur la physiologie et la pathologie du système nerveux* (1858); Vulpian, *Leçons sur la physiologie générale et comparée du système nerveux* (1866); Dalton, "Treatise on Human Physiology" (1859; 5th ed., 1871); Flint, "Physiology of Man," vol. iv. (1872); and other systematic works on physiology.—**NERVOUS DISEASES** are properly divided into the functional and structural diseases of the nervous system. The functional diseases are those in which there is no morbid change or lesion in the nerve structures to account for the symptoms; they manifest themselves by irregular, depressed, or exalted conditions of the peculiar functions of the nervous system, viz., sensibility and motion. They may be enumerated as follows: 1. The numerous varieties of neuralgia which are independent of disease of the nerves or their centres. 2. The various forms of insanity, as delirium, monomania, dementia, and general paralysis, where no morbid change occurs in the brain to account for the symptoms. 3. The protean nervous phenomena, neuralgia, paralysis of sensation and motion, convulsions, and the various exhibitions of mental and moral perversity, constituting the disease known as hysteria. 4. Delirium tremens, that derangement of the nervous functions, manifested by optical illusions, hallucinations, mania, and muscular trembling, which arises from exhaustion of the nervous power produced by prolonged stimulation by alcohol. 5. Chorea or St. Vitus's dance, an affection occurring generally in young girls between the period of dentition and puberty, and consisting in irregular contractions of the voluntary muscles. This disease has been graphically termed "insanity of the muscles." 6. The convulsions and paralysees that occur in infancy and childhood from the irritation of teething or from gastric

and intestinal derangements. 7. Tetanus or locked-jaw, a rigid spasm of the voluntary muscles arising from an exalted state of the reflex function of the spinal cord, sometimes spontaneous, but more often the result of punctured or lacerated wounds. 8. The rare and curious derangements known as catalepsy and ecstasy. It is doubtful whether in all these cases structural disease of the nervous tissues do not really exist, and may not be discoverable by more complete examination. Accounts of these diseases will be found under appropriate heads. Structural diseases of the nervous system, or those in which the nervous symptoms arise from some morbid change or lesion in the nerve structures, may be divided into: 1, diseases of the brain and spinal cord and their coverings or membranes (see BRAIN, DISEASES OF THE); and 2, diseases of the nerves. The latter are not numerous. (See NEURALGIA.) Epilepsy, sometimes a purely functional disease of the nervous system, and sometimes organic in its origin, is described under its own head.

NESHOBA, an E. county of Mississippi, intersected by Pearl river and drained by its branches; area, 600 sq. m.; pop. in 1870, 7,439, of whom 1,703 were colored. Much of the land is uncultivated. The chief productions in 1870 were 176,189 bushels of Indian corn, 27,624 of sweet potatoes, 2,971 lbs. of tobacco, 2,492 bales of cotton, 6,471 lbs. of wool, and 5,438 gallons of sorghum molasses. There were 1,549 horses, 513 mules and asses, 2,813 milch cows, 4,773 other cattle, 4,409 sheep, and 11,774 swine. Capital, Philadelphia.

NESS, a W. central county of Kansas, watered by Walnut creek and Pawnee fork, affluents of the Arkansas; area, 900 sq. m.; pop. in 1870, 2. The surface consists of rolling prairies, and the soil is productive.

NESSELRODE, Karl Robert von, count, a Russian statesman, born on board a Russian frigate in the port of Lisbon, Dec. 14, 1780, died in St. Petersburg, March 23, 1862. He was baptized in the Protestant faith on board an English ship. He belonged to a noble German family settled in Livonia, and at the time of his birth his father was ambassador to Portugal. He began his career in the military service, but early became attaché to the various embassies of his father. Subsequently he served in that capacity with the embassies at Paris and the Hague. He gained the favor of the emperor Alexander by the brilliant style of his diplomatic compositions (which however were drawn up by his secretary), and received an appointment in the ministry of foreign affairs in St. Petersburg. As councillor of the cabinet he was frequently brought into personal contact with the emperor, who learned to appreciate his knowledge of international law and of European affairs. At the same time he knew how to disguise his superiority under an appearance of modesty, and to make the ideas which originated from his own mind appear to proceed from his

master. The favorable impression he thus produced led to his being intrusted with the ministry of foreign affairs before he was 32 years old (1812), at first under Count Razumovski; and he began from that time to control the relations of Russia with foreign countries. He formed the coalition with England and Prussia in 1813, and the negotiations and treaties with England, Sweden, Prussia, and Austria, which determined the result of the conflict with France, were almost all concluded under his influence. In the night of March 30-31, 1814, he signed the capitulation of Paris, which put an end to the wars of the first French empire (excepting the hundred days); and 42 years afterward he retired from public service after the signing of the treaty of peace in Paris, March 30, 1856, which terminated the war with Napoleon III. and his allies. At the congress of Vienna (1814-'15) Nesselrode was the first to assume for Russia that attitude of superiority which, combined with a tone of courteous and bland moderation in communicating with other nations, has since given to Russian statecraft a distinguished position in the diplomatic world. Sympathizing most with Austria, he endeavored at the same time to maintain intimate relations with Prussia, and also showed great moderation toward France, effectually opposing at the congress of Aix-la-Chapelle (1818) Great Britain's desire of prolonging the occupation of France by foreign garrisons, and exerting himself to obtain a reduction of the enormous fines imposed upon her after the battle of Waterloo. Louis XVIII. and his minister Richelieu showed their gratitude to Nesselrode and his colleague Pozzo di Borgo, and immense amounts of money passed into the hands of both. The great wealth secured by him on that and other occasions made him one of the richest men of Europe. He was one of the most extensive sheep graziers in Russia, his flocks amounting to more than 150,000, and his personal property was enormous. But the prosaic tenor of his mind was not congenial to the poetical and mystical disposition of Alexander, who regarded the holy alliance as a religious matter, while Nesselrode looked upon it merely as a political power. While preserving the first place in the foreign ministry, he was to some extent supplanted for a while in the emperor's confidence by Count Capo d'Istria, who was appointed as his colleague; but the outbreak of the Greek revolution led to his withdrawal and left Nesselrode sole master of the foreign office. The revolutionary movements which at the same period agitated Italy, Spain, and Portugal, caused Nesselrode and Metternich to adopt a stringent policy, which had reached its climax at the time of the death of Alexander I. in 1825. Nesselrode continued to enjoy the confidence of the new czar Nicholas, whose energy and commanding individuality, however, made his position less influential than it had

been under Alexander. Nesselrode's policy having always been marked by moderation and caution, the hostile attitude assumed toward Turkey soon after the accession of Nicholas was attributed rather to the emperor than to his minister; while the skill which the latter manifested in the negotiations, from those which preceded the battle of Navarino to the peace of Adrianople, contributed to strengthen the political influence of Russia. In 1844 he was promoted to the rank of chancellor of the empire. From that time his influence constantly increased. His administration, distinguished for unity of spirit and perfect mechanism, was weakened by his inflexible adherence to the policy of the holy alliance, but tempered by his desire of maintaining friendly relations with France and the other European powers. This peaceful disposition clashed with the impetuous character of Nicholas, particularly during the complications which led to the Crimean war; and although Nesselrode continued to conduct the foreign affairs during the lifetime of Nicholas and while the war was in progress, he retired soon after the accession of Alexander II. Throughout his official career he was noted for kindness toward his subordinates. Conspicuous among his personal habits was his fondness for cooking; in his daily consultations his cooks are said to have had the precedence over all others, and the invention of many dishes is attributed to him, among which is the pudding *à la Nesselrode*. His only son is now one of the "masters of the court" at St. Petersburg.

NESTOR, a legendary Grecian hero, son of Neleus and Chloris, and king of Messenian or of Triphylian Pylos. Previous to going to Troy he had taken part in wars with the Arcadians and Eleans, and in the conflict of the Lapithæ with the Centaurs; and he is also enumerated among the Calydonian hunters and the Argonauts. He went to Troy with 60 ships, at a great age, having ruled three generations of men, and during the siege figured as soldier, councillor, and orator; his superior wisdom was appealed to in all dissensions among the Grecian commanders. In the famous quarrel between Agamemnon and Achilles, he effected their reconciliation. He returned home in safety after the fall of Troy.

NESTOR, the earliest Russian chronicler, born about 1056, died about 1114. In the 17th year of his age he entered the Petcherskoi convent of Kiev, where he wrote his annals of Russia, commencing with the first appearance of the Varangians in that country about the middle of the 9th century, and bringing the history down to his own times, various events of which he described from personal observation. He wrote in the old Slavic church dialect, and both as regards the language and the contents the original work has been considerably altered by the modifications and interpolations of various continuators, so that the real merits of Nestor can hardly be ascertained.

The best edition of the text is that by Bykoff, chief librarian of the imperial library (St. Petersburg, 1873). The principal translation and critical illustration of the text are by Schlözer, *Nestors Russische Annalen*, &c. (5 vols., Göttingen, 1802-'9).

NESTORIANS, a sect of early Christians, so called after Nestorius, bishop of Constantinople in the 5th century. (See **NESTORIUS**.) They claim a still earlier origin, ascribing their conversion to the preaching of the apostle Thomas. According to a very common tradition, they are also of Jewish descent, claiming that their ancestors came from Ur of the Chaldees, and from the loins of Abraham; hence they sometimes call themselves Chaldeans. The council of Ephesus (431), which condemned and banished Nestorius, declared the true sense of the church to be that Christ consists of one divine person, yet of two natures, not mixed and confounded, although intimately united, forming what is known to theologians as the hypostatical union. But this definition did not end the controversy. John, bishop of Antioch, and several other eastern prelates, held another council at Ephesus, and issued a severe sentence against Cyril of Alexandria; and though a reconciliation was effected between John and Cyril in 433, the disciples of Nestorius continued to propagate his doctrines throughout the East. Before the close of the 6th century his followers were numerous in most countries of the East, penetrating even to India, Tartary, and China. The Nestorian church had patriarchs a part of the time at Babylon, but occupying successively the cities of Seleucia, Ctesiphon, Bagdad, and Mosul. Schools for the training of their clergy and missionaries were established at Edessa, Nisibis, Seleucia, Bagdad, and many other places. They were almost from the first divided among themselves, and at various synods adopted doctrines, such as the existence of two distinct persons in Christ as well as two distinct natures, which it is not agreed that Nestorius himself ever taught. A portion of them adhered to the Monophysite heresy. (See **CHRISTIANS OF SAINT THOMAS**.) The Nestorians were especially strong in Persia, where at one time they were the dominant sect. But in consequence of dissensions which arose in 1551, 70,000 or 80,000 of them, dwelling on the west side of the Kurdish mountains and on the plains of Mesopotamia, were led to unite with the church of Rome. Their descendants are not to be confounded with the Nestorians proper; they call themselves Chaldeans, although their exclusive right to that title is disputed. Many of them still speak Syriac, though the common speech around them is Arabic. The Jacobites, who also are numerous in Mesopotamia, were originally of the same stock, but are now quite unlike the Nestorians, and have no fellowship with them; they call themselves Syrian Christians. Some of them are subject to the Roman see. As Mohammedanism ad-

vanced eastward, the Nestorians were borne down before it; some were converted by the sword, and others killed. Still later Tamerlane destroyed a large portion of those who were not subdued by Mohammed; so that the Nestorians of to-day, about 150,000, are but a feeble remnant of a once powerful people. They dwell in the northwestern districts of Persia, spreading westward into the Kurdish mountains, a small portion residing within the borders of the Turkish empire. About 40,000 are on the plain of Oroomiah, inhabiting 300 villages, and chiefly occupied in agriculture. Their condition is seldom better than that of serfs under their Mohammedan masters. Many of the mountain districts inhabited by the Nestorians are so rugged that a beast of burden can hardly travel over them. The people subsist chiefly by the pasturage of their flocks, sometimes cultivating little terraced patches of land a few rods square. They are miserably poor, and often subject to the most cruel oppressions from their Kurdish neighbors, who inhabit the same mountains. A bloody onset was made upon them by the Kurds in 1843; nearly 10,000 Nestorians were slain, and many were sold into slavery. A little further south, in the deep, rugged valley of the Zab, a tributary of the Tigris, their condition is a little better, and they manifest more of the independent spirit of their ancestors. They have often successfully resisted the attacks of the Kurds, and they subsist more by the cultivation of the soil. Attention was particularly called to the Nestorians in 1831 by the "Researches" of Messrs. Smith and Dwight, missionaries of the American board, on a tour of observation in that region. They found them substantially maintaining their ancient faith, but sunk in ignorance and degradation. Few even of the men could read intelligently, and only one woman was found who could read at all, she being the sister of the patriarch. They had no printed books, and only a few manuscript copies of the Scriptures and other works, and these only in the ancient Syriac, which was virtually a dead language, studied only by the priests and a few others. The Bible was venerated as a relic, and the few copies existing were wrapped in cloth and laid away in the dingy churches, and brought out on great saints' days, to be kissed, but not to be read. All were enslaved by onerous fasts. Lewd dances formed their most popular social amusement, and drunkenness was so common as hardly to excite notice. The condition of woman generally was that of degradation and servitude. The birth of a daughter was regarded as a calamity. The abode of a family, often embracing several generations, consisted of a single room of the poorest description. Printing was unknown, and the spoken language had not been reduced to writing. The library of the patriarch, which was considered enormous, consisted of less than 60 volumes, including several duplicates. Many of the priests

scarcely understood the meaning of the words they used in their church service, and to the people generally they were entirely unintelligible. Theirs was virtually a dead church. And yet they still held tenaciously to the Christian name and substantially to the Christian doctrine, and their forms of worship were comparatively simple. Professing the Nicene creed with a few modifications, asserting the distinction of person and natures in Christ, refusing the title of "Mother of God" to the Virgin Mary, rejecting the doctrine of purgatory, yet praying for the dead, they acknowledged seven sacraments, though it was not always clear which they all were, burial being sometimes reckoned as one; they allowed marriage to all the clergy except bishops and the patriarch (though this restriction was violated by Bishop Mar Yohanan in 1859), and discarded auricular confession, though it is prescribed in their ancient books. They were found to be frank and manly. In stature and complexion, though somewhat darker, they differ little from Americans. American missionaries began to reside among them in 1833, and were kindly welcomed by priests and people. The first work of the missionaries, after mastering the native tongue, was to reduce the spoken language to writing, to translate the Scriptures into it, and to establish schools, some of the native clergy being among their best scholars and most efficient helpers. They also prepared school books in the vernacular, translated works of general interest into Syriac, and became teachers of the people. Their first aim was to reform the Nestorian church, not to plant any other, and for a time many of the best of the native ecclesiastics worked cordially with them. But after a while many of these drew back, and most of those who were regarded as real converts have come out from the old church and organized new societies. These are now 17 in number, with 73 congregations, simpler forms of worship, and 767 members. There are 70 schools and 1,124 pupils, and 110,000 volumes have been issued.—See "A Residence of Eight Years in Persia," by Justin Perkins (Andover, 1843), and Anderson's "Oriental Churches" (1872).

NESTORIUS, a Syrian bishop, born near the close of the 4th century, died in Libya about the year 440. He was a disciple of Theodore of Mopsuestia, became a presbyter of Antioch, and was made patriarch of Constantinople in 428. He was distinguished for his zeal against the prevailing heresies, particularly those of the Apollinarians. In his opposition to their doctrine, Nestorius maintained that there was a great distinction between Christ as the Son of God and Christ as the son of man; that the actions and sensations of the one person were to be carefully discriminated from those of the other; and that the Virgin Mary could not be called Θεοτόκος, "mother of God," but only Χριστοτόκος, "mother of Christ," because it was only the human nature of Jesus

Christ that was born of her, since God could neither be born nor die. His opinions were vigorously combated by Cyril, bishop of Alexandria, who by advice of Pope Celestine called a council at Alexandria in 430 to determine the controversy. By this assembly Nestorius was judged guilty of blasphemy and anathematized. He retorted by charging Cyril with confounding the two natures of Christ, and anathematized him in turn. Cyril, jealous of the overshadowing power of the see of Constantinople, induced the emperor Theodosius II. to call a general council at Ephesus in 431, at which Cyril presided. Nestorius was peremptorily summoned before it; but as the bishop of Antioch and others from the East who were friendly to him had not yet arrived, and the council had been improperly organized, he refused to appear and protested against their action. But he was again condemned, deprived of his bishopric, and banished from Constantinople. He was sent first to Arabia Petraea, and afterward to one of the oases of Libya. (See CYRIL OF ALEXANDRIA, and NESTORIANS.)

NETHERLANDS, or Low Countries (Dutch, *Nederlanden*; Fr. *Pays-Bas*), a country of western Europe, formerly comprising Belgium as well as the present kingdom of the Netherlands. The term is applied to this region because a large portion of the surface is a dead plain, and much of it lies below the level of the sea, from which it is protected partly by natural sand hills and partly by vast artificial dikes or embankments. The kingdom of the Netherlands as it was before 1830 was bounded N. and W. by the North sea, E. by Prussia, and S. by France, from which countries it was not separated by any great natural barriers. It is the western termination of the vast plain which stretches across Europe to the Ural mountains. Three great rivers, the Rhine, the Maas, and the Scheldt, flow through it, and their mud, mixing with the sand banks thrown up by the ocean around their mouths, has formed the country, which, excepting the S. E. portion, is nothing but the delta of those rivers. It was by nature a wide morass, which man has made fertile and habitable by laboriously protecting it by embankments from the overflow of the rivers and the frequent inundations of the sea. At present this region is divided into two kingdoms of nearly equal size, the Netherlands in the north and Belgium in the south. (See BELGIUM.)—The present kingdom of the Netherlands lies between lat. 50° 45' and 53° 35' N., and lon. 3° 24' and 7° 12' E., and is bounded N. and W. by the North sea, E. by Germany, and S. by Belgium. Its length from N. to S. is about 190 m., and its breadth from about 60 to 120 m., with an area of 12,680 sq. m. It is divided into 11 provinces, which with their respective areas, their population in 1873 (according to the annual official calculation, the last decennial census having been taken in 1869), and their capitals, are as follows:

PROVINCES.	Area, square miles.	Population in 1873.	Capitals.
North Brabant	1,980	448,045	Bois-le-Duc.
Gelderland	1,964	441,088	Arnhem.
South Holland	1,155	721,464	The Hague.
North Holland	1,054	610,990	Amsterdam.
Zealand	650	182,365	Middelburg.
Utrecht	534	179,465	Utrecht.
Friesland	1,264	307,390	Leeuwarden.
Overijssel	1,282	260,533	Zwolle.
Groningen	885	232,739	Groningen.
Drenthe	1,031	109,454	Assen.
Limburg	851	227,469	Maestricht.
Total	12,680	3,716,002	

The grand duchy of Luxemburg, though it is governed by the king of the Netherlands as grand duke, is in point of administration entirely separate. (See LUXEMBURG.) The Netherlands possess important colonies in various parts of the world, whose aggregate population far exceeds that of the mother country. The principal of these are: in the East Indies, Java, Madura, Bali, Lombok, Banca, Ternate, Amboyna, Banda, Timor, and extensive territories in Sumatra, Borneo, and Celebes, with a total population in 1872 of 24,300,000; in America, Surinam (Dutch Guiana), Curaçoa, and the islands of St. Eustatius, Aruba, Bonaire, St. Martin, and Saba, with a total population of nearly 100,000. The former possessions in W. Africa, comprising a few posts on the coast of Guinea, were by a treaty concluded in 1871, and ratified in February, 1872, ceded to Great Britain. The Hague is the residence of the king and the seat of the legislature, and Amsterdam the nominal capital of the kingdom; the other principal cities are Rotterdam, Utrecht, Leyden, Groningen, Arnhem, Middelburg, Haarlem, Maestricht, Leeuwarden, Dort, Bois-le-Duc, Nimeguen, Delft, Zwolle, and Breda.—The seacoast of the Netherlands is lined in great part by sand banks cast up by the waves of the ocean, and, where these have not been formed, by vast dikes, built partly of granite blocks brought from Norway, and partly of timbers, fagots, turf, and clay. These embankments are usually 30 ft. high, 70 ft. broad at the bottom, and wide enough at the top for a roadway. They have been constructed by the labor of many generations, at a cost estimated at not less than \$1,500,000,000, and are maintained by an annual expenditure of upward of \$2,000,000. Great pains and much expense are bestowed to keep them in order, and their supervision is intrusted to a board of commissioners, under whom there are many boards of sub-commissioners for particular districts, who from time to time report to the central board the condition of the dikes under their care. (See DIKE.) The principal rivers of the Netherlands are the Rhine, the Maas or Meuse, the Scheldt, and the Vecht, though only the lower parts of these streams are within the limits of the country. The Rhine enters from Germany on the east with a breadth of nearly half a mile,

and divides into two branches, of which the southern, taking the name of the Waal, runs W. for a considerable distance till it joins the Maas. The N. branch, after running N. W. a few miles, divides into two streams, of which one, called the Leek, runs W. and joins the N. branch of the Maas near Rotterdam; and the other, called the Yssel, runs N. and falls into the Zuyder Zee. The Maas enters the Netherlands from Belgium near the S. E. corner of the kingdom, and flows at first N., then N. W., and finally W., and below Gorkum divides into two branches, one of which, the Merwede, again divides, and after flowing around the island of Ysselmonde falls into the North sea; the other branch, flowing more to the south, also divides into two smaller streams and falls into the same sea. The Scheldt enters from Belgium in the southwest, and divides into two branches, one of which, called the Eastern Scheldt, flows N. between Zealand and North Brabant, and then W. by many channels, enclosing numerous islands, to the sea; the other branch, the Western Scheldt, flows W. in a broad estuary to the sea. The Vecht enters from Germany on the northeast, and falls into the Zuyder Zee at no great distance from the mouth of the Yssel. All these rivers are kept within prescribed channels by embankments, and are connected by canals, which serve not only for navigation but to prevent inundations by draining off the superfluous waters. The Netherlands originally abounded in lakes, about 90 of which have been artificially drained and converted into cultivable land, while others by inundations have been changed into gulfs of the sea. Among the latter is supposed to be that great inlet of the North sea, the Zuyder Zee, which covers about 1,200 sq. m. in the N. part of the kingdom, and is thought to have been originally a large fresh-water lake. The lake of Haarlem, before it was drained, covered 70 sq. m. (See DRAINAGE, and HAARLEM MEER.) The Dollart, a lake between Groningen and the Prussian province of Hanover, was formed by irruptions of the sea in 1277 and 1287, and occupies about 60 sq. m.—The surface of the country is almost everywhere a dead level, and such natural elevations as exist are little more than small sandy hillocks. But the monotony of the surface is relieved by the numerous canals crossed by frequent bridges, and lined with willows and other trees, with which also the roads are bordered; by large and handsome towns at short intervals; and by countless villas and farm houses, all of which are kept in a state of the utmost order and neatness. The country is everywhere well peopled, and no population in the world exhibits a more uniform appearance of wealth, comfort, and contentment. The soil in some places, especially in the waste lands of Gelderland and Drenthe, is naturally poor, but by cultivation has been rendered as rich and productive as the other parts. Wheat, rye, barley, oats,

peas, beans, buckwheat, madder, rape seed, hops, tobacco, clover seed, mustard seed, flax, and hemp are extensively raised. Dutch horticulture has long been famous, and among the flowers tulips and hyacinths are especially cultivated. Pulse and garden vegetables are everywhere raised in great abundance. Very large orchards of apple, pear, and cherry trees are found, especially in Gelderland. Of the entire area about three fourths is productive land, and more than one half of this consists of meadows and pasture. The woodland comprises only about 9 per cent. of the productive soil. In South Holland the pasture land is twice as extensive as the arable, while in Friesland the proportion is more than 8 to 1, and the rearing of live stock and dairy husbandry are more productive and profitable than tillage. In 1870 the country had 252,054 horses, 1,410,822 cattle, 900,187 sheep, and 329,058 hogs. Upon the excellent meadows created by draining bogs and lakes vast herds of cattle, some of which are brought from Denmark and Germany in a lean state, are fattened for market. Immense quantities of butter and cheese of the best quality are produced and exported at high prices. Another important product of the soil is peat, which is largely used for fuel.—The climate is variable, and subject to great extremes of heat and cold. The temperature has sometimes fallen to 23° below zero, and risen to 102°. In winter the rivers and canals are sometimes frozen for three months. The country is subject to violent gales; the atmosphere is generally damp, dense fogs prevail, and agues, pleurisies, and rheumatisms are frequent. Consumption is not uncommon. The pleasantest months are August and September. From the nature of the soil, which is almost everywhere alluvial clay and sand, there are necessarily no mines, though a little bog iron has been found. The eastern provinces, especially Gelderland and Overijssel, have some forests of oak, elm, and beech, but in general the country is destitute of trees except those which have been planted by man. Plantations, however, are very numerous, and serve greatly to embellish the vicinity of the towns and villages; and the level scenery is also diversified by groups of wind mills, mostly employed in draining the low grounds. There are no large wild animals and few game birds, though partridges, hares, and rabbits are plentiful. Storks are very numerous, and remain from the middle of February till the middle of August. They are favorites with the people, and severe penalties are imposed on those who destroy them. Water fowl are extremely abundant, and the waters of the coast are frequented by vast shoals of cod, turbot, and other fish.—The population of the Netherlands is composed mainly of Dutch, with about 250,000 Walloons, Frisians, and Germans, and about 68,000 Jews. The Dutch belong to the great Germanic family of mankind. The men are generally of middle stature,

stout form, and fair complexion. The women are tall and handsome, are very domestic in their habits, and pay the most scrupulous attention to the cleanliness of their houses. Sobriety, steadiness, economy, perseverance, and industry are the most striking features of the national character. Even the youth of both sexes are as sedate and cautious as the older people of other nations. Smoking is very common. Brandy, gin, and beer are favorite beverages, but intoxication is said to be very rare. There is great wealth in the Netherlands, and it is widely diffused, but there is little ostentatious display of it. The people generally live well, but frugally. The houses in the towns are plainly built and furnished. The country abounds in villas called pleasure houses (*lust-huizen*), which are usually built of brick, plastered and painted.—There are more than 600 ship yards in the country. Among the chief branches of industry are the iron and brick manufactories, the oil mills, and the tobacco manufactories. The fabrication of earthenware at Delft is extensive and celebrated. This country has long been noted for its distilleries of spirits, and especially of gin, for which Schiedam is peculiarly famous. The manufacture of paper is extensive, and there are in the provinces of Friesland, Groningen, Gelderland, and North Brabant many establishments for the manufacture of shoes for exportation. The Dutch linens are of superior quality, and the manufacture of linen and cotton goods is carried on extensively in most of the provinces. The cotton manufacture in 1873 employed about 230,000 spindles. At Tilburg there are woollen manufactories employing several thousand persons, and there are extensive silk manufactories at Amsterdam, Haarlem, and Breda. The fisheries of Holland have long been famous for their extent and productivity, especially the herring fishery, which has been carried on since the 12th century, and has been termed the Dutch gold mine. It is a common saying among the people that "the foundations of Amsterdam are laid on herring bones." In the middle of the 18th century the number of men employed in the herring, cod, and whale fisheries was computed at 100,000. In the first half of the 19th century the fisheries greatly declined, and in 1854 the number of vessels of all kinds employed was 1,375, of men 7,753, and the value of the produce about \$15,000,000. Since then it has again improved, and the total number of families supported by the fisheries was in 1872 estimated at 20,000.—The commerce of the Netherlands, though not as extensive as formerly, is still great and active. In 1871 the imports were valued at 586,800,000 florins, and the exports at 460,500,000. Commerce is carried on chiefly with Great Britain, Germany, Java, Belgium, France, and Russia. The exports to the United States from the Netherlands and the Dutch colonies during the year ending June 30, 1873, were valued at \$11,700,-

000, and the imports at \$12,500,000. The mercantile marine in December, 1874, comprised 1,804 vessels, with an aggregate tonnage of 495,285. In 1873 the entrances of shipping into the Dutch ports amounted to 8,762 vessels of 2,968,404 tons, and the clearances to 8,765 vessels of 3,029,646 tons.—The internal intercourse and commerce of the country are chiefly carried on by means of the canals, which communicate with the Rhine and other large rivers, and afford an easy and cheap conveyance for merchandise and passengers. The usual mode of travelling on the canals was formerly, and in a very few districts is still, by *trekschuits* or draught boats, which are dragged by horses at the rate of 4 m. an hour; but small steamboats are now commonly used. The principal canal, the North Holland, runs N. from Amsterdam to the harbor of Nieuwediep on the Helder point, where it joins the sea and thus affords Amsterdam an easy intercourse with the ocean. (See CANAL, vol. iii., p. 688.)—A large part of the foreign commerce of the Netherlands is conducted by the *Handel Maatschapij*, or trading association, which in 1824 took the place of the Dutch East India company, which had for two centuries monopolized the trade with the East. (See EAST INDIA COMPANIES.) The *Handel Maatschapij* is the agent for the sale of the government colonial produce in Europe, of which it is also the carrier, and farms some branches of the public revenue of the East India colonies. Two thirds of the exports of the colonies pass through its hands, though it has no exclusive trading privileges. Another great association is the "Society for the Promotion of the Public Good" (*Maatschapij tot nut van 't algemeen*), which was organized in 1784 by a few benevolent persons, and has spread till it has upward of 200 branches throughout the country, with many thousand members, each of whom contributes to its funds a small sum annually. Its object is to promote the establishment of schools, hospitals, asylums, and other works of public utility. Its sections hold meetings once a fortnight, at which questions and measures tending to advance the common welfare are discussed, politics and ecclesiastical matters being excluded. Institutions for the relief of the destitute and suffering are abundant, though in general the poor are taken care of by the churches to which they belong. The number of savings banks in 1870 was 206, of which 162 belonged to the society of public good; 169 savings banks, from which official reports had been received, had 91,565 depositors, whose aggregate credits amounted to 11,933,086 florins. There are three great almshouses, one each at Amsterdam, Middelburg, and Groningen, which afford shelter, food, and clothing to a large number of persons. Pauper colonies have also been formed on the waste lands of the country, and the able-bodied men employed in reclaiming them. The expense of these colonies is about \$1,000,000 per annum,

and the total annual revenues of the charitable institutions of the kingdom exceed \$5,000,000. The total number of persons receiving aid from the state in 1869 was 213,620. Education is provided for by a non-sectarian primary instruction law, passed in 1857. It is under the care of the department of the interior, and is compulsory. In January, 1871, there were 2,608 public and 1,119 private schools, the former numbering 390,129 and the latter 111,762 pupils. The teachers are superintended by 94 district school inspectors, who are under 11 provincial superintendents. The proportion of the pupils of the primary schools to the entire population is 1 in 8. Higher education is imparted by 81 schools of middle instruction, with 7,047 pupils, and 55 Latin schools and gymnasia, with 1,128 pupils. There are three universities, at Leyden, Groningen, and Utrecht, with 1,339 students in January, 1871; two collegiate institutions called *Athenæums*, at Amsterdam and Deventer; and a polytechnic institution at Delft.—By the constitution of the Netherlands full religious liberty is guaranteed to the people, and all churches are equal before the law. On Dec. 1, 1869, the population was thus divided: Dutch Reformed, 1,956,852; Walloon Reformed, 5,371; Remonstrants, 5,486; Christian Reformed, 107,123; Mennonites, 44,227; Evangelical Lutheran, 57,545; Reformed Lutheran, 10,522; Moravians, 371; Anglican Episcopal, 456; church of Scotland, 84; English Presbyterians, 417; Roman Catholics, 1,307,765; Old Catholics (*Jansenists*), 5,287; Greek church, 32; Dutch Israelites, 64,478; Portuguese Israelites, 3,525; unknown, 5,161. The government partly pays the salaries of the ministers, priests, and rabbis of recognized congregations. The Reformed church holds to the "Confession of Faith" drawn up in the 16th century according to the doctrines of Zwingli and Calvin. It has a presbyterian form of government, and is ruled by a consistory in each congregation, by classes composed of the ministers of several contiguous parishes, together with one elder from each, by provincial synods, and by a general synod which meets annually at the Hague. The number of ministers in the church in 1873 was 1,596. There is a Roman Catholic archbishop at Utrecht, and bishops at Haarlem, Bois-le-Duc, Breda, and Roermond. The majority of the Roman Catholics are in North Brabant and Limburg. The church in October, 1873, had 973 congregations and 2,023 priests. The Old Catholics have an archbishop of Utrecht, and bishops of Haarlem and Deventer.—The government of the kingdom of the Netherlands is a constitutional monarchy, of which the crown is hereditary in the house of Orange-Nassau. All the inhabitants without distinction are entitled to protection for person and property, and all natives are eligible to offices and public employment. Freedom of the press and the right of the people to assemble and to petition are inviolable. The eldest

son of the king bears the title of prince of Orange. The king possesses the executive power, declares war, concludes peace, and makes treaties, commands the army and navy, fixes the salaries of all officers, and confers titles of nobility. He proposes projects of law to the legislature, whose chambers he can dissolve at pleasure, though he must command new elections in the course of 40 days after the dissolution, and must convene the new chambers within two months. He has a council of state, consisting in 1873 of 15 members besides the princes of the royal house, which may be consulted on extraordinary occasions. In 1874 there were seven heads of departments in the ministerial council, viz., the ministers of the interior, of finance, of justice, of the colonies, of foreign affairs, of marine, and of war. The king, the ministers, a secretary, and two royal princes constitute at present the members of the cabinet council. The legislative power is intrusted to the states general, composed of two chambers. The members of the upper house (called *eerste kamer*, first chamber), 39 in number, are elected by the provincial states for a term of nine years, a third of their number retiring every three years. Their president is appointed by the king once a year. The members are selected from the class who pay the highest amount of direct taxes, the number of persons eligible in 1871 being 1,098. The following is the ratio of their distribution among the provinces: Drenthe, 1; Groningen, 2; Utrecht, 2; Zealand, 2; Friesland, 3; Limburg, 3; Overijssel, 3; Gelderland, 5; North Brabant, 5; North Holland, 6; South Holland, 7. The lower house (*tweede kamer*, second chamber) in 1872 had 80 members, who are chosen for four years, from 41 electoral districts, to which they are assigned in the ratio of one representative to 45,000 inhabitants, Amsterdam having 6 representatives. They are chosen at biennial elections by electors who must be 23 years of age, and pay taxes varying in different districts from about \$8 per annum to about \$24. Each member is paid a salary of about \$800 a year and his travelling expenses. The speaker of the house is appointed by the king. The king's ministers have a right to sit and speak in either house, but not to vote. The states general meet at the Hague every year on the third Monday in September, and hold their sessions in public. They are obliged by law to sit at least 20 days. A majority is required for a quorum; and no measure can be enacted without the assent of an absolute majority of each house. In each province there are provincial "states," which are legislative and administrative bodies. Besides electing the members of the upper house of the states general, they are charged with the execution of the laws of the kingdom within their limits, and have power to make special and local laws, which, however, are subject to the sanction or veto of the king. The internal police of the

provinces is left to their superintendence. The king appoints a commissioner to preside over their sessions, which are held semi-annually. The members are elected for six years at triennial elections, by the same constituencies that elect the members of the states general. The number of the members of these provincial legislatures varies in each province, that of South Holland, which is most numerous, having 80 members, and that of Drenthe, the smallest, 35. The communes into which each province is subdivided are governed by a burgo-master appointed by the king and by local councils elected by the people for a term of years. In 1874 the public debt amounted to 987,020,076 florins. The receipts were 93,742,143 florins, and the expenditures 100,243,980. The receipts of the colonial administration in 1874 were 124,908,632 florins, and the expenditures 114,761,528. In the budget for 1875, presented Sept. 19, 1874, the receipts were estimated at 129,000,000 florins, and the expenditures at 119,000,000. The army in 1874 comprised 62,071 men. The navy consisted of 84 steamers and 16 sailing vessels, carrying together 773 guns, besides which there were about 70 gunboats. The fleet was manned on July 1, 1874, by 6,886 men, including 1,864 marines. The largest moneyed institutions are the Netherlandish bank in Amsterdam, founded in 1814, which is a bank of issue and has a capital of 16,000,000 florins; the bank of Amsterdam, established in 1872, capital 10,000,000; and the bank of Rotterdam, capital 15,000,000. The aggregate length of the railroads in operation Jan. 1, 1874, was 989 m., the larger portion of which were owned by the state, besides 549 m. for which concessions have been given. The electric telegraph lines owned by the state had an aggregate length of 3,277 m.; the length of the wires was 11,738 m. The extent of the net of private telegraphs is not known.—Justice is administered by various courts, the chief of which is the high court of the Netherlands, consisting of a president, vice president, and 12 judges, appointed by the king from three candidates presented to him for each vacancy by the lower house of the states general. The judges hold office for life. This court hears appeals from the lower courts. All causes in which the state is defendant are tried before this court, and the high functionaries of government are amenable to it only. There is also a provincial court in each province, and subordinate to them are district courts, which have each from 5 to 14 judges, and 150 cantonal courts, which have each a judge of the peace and a recorder. In 1870 the prisons of all kinds had 2,407 inmates. There is an excellent prison for male juvenile delinquents at Rotterdam, and another for young females at Amsterdam, which are admirably managed and serve as schools for intellectual and religious training.—The first historical notice of the Netherlands (in the wider sense) which has

come down to us is contained in Cæsar's account of his wars with the Belgæ and other barbarian tribes who inhabited its morasses. These tribes were mostly of Gallic race, though in some parts of the country several clans of Germanic origin had established themselves, preëminent among whom were the Batavi, whom Tacitus calls the bravest of all the Germans, and of whom in fact the Romans always spoke with marked respect. They were the allies, not the subjects of the Romans, and a Batavian legion formed the body guard of the emperors down to the time of Vespasian. During the civil war between Vespasian and Vitellius, Claudius Civilis, a Batavian who had served for many years in the Roman army and had received a Roman education, organized a general confederation of all the Netherland tribes against the Romans (A. D. 69); but after a heroic struggle the insurgents were crushed by the armies of Vespasian, who had now attained the purple, and the Netherlands remained among the provinces of the empire till they were overrun by the northern barbarians in the 5th century. The Batavi still formed the bravest portion of the Roman forces, and their cavalry was particularly distinguished. In the great battle at Strasburg between the Germans and the army of the future emperor Julian (357), the Batavian horse saved the day for the Romans. This was the last of their achievements mentioned in history, and soon afterward the Batavian nation seems to have lost its individuality and to have become merged, together with the Belgæ, in the Frankish and Frisian tribes who had invaded and occupied the country. The monarchy of the Franks in the 6th and 7th centuries embraced the whole of the Netherlands. In the 8th century the Frisians revolted, but were subdued by Charles Martel about 734, and were soon afterward converted to Christianity. At the beginning of the 9th century they formed a part of the empire of Charlemagne. A century later, under the influence of the feudal system, the whole of the Netherlands was in the possession of a number of princes, owning a limited species of allegiance, some to the German empire, and some to the kings of France. In 922 Charles the Simple created by letters patent the first count of Holland. Before the 13th century the Netherlands had become divided into several dukedoms and countships, whose chiefs acknowledged little more than a nominal allegiance to any other sovereign. The most powerful of these potentates was the count of Flanders, whose dominions in 1384 fell to the house of Burgundy; and in 1437 Philip the Good, duke of Burgundy, became master of almost the entire Netherlands, and his successors acquired the rest. At this period the country had already become rich and populous, and the commercial cities had acquired a controlling influence in the government, and within their own limits enjoyed almost republican freedom. The states general, as the parliament

was called, granted money to the sovereign only when they saw fit. Under the house of Burgundy the Netherlands became the most opulent and populous part of Europe; and their chief cities, Antwerp, Ghent, and Bruges, were especially distinguished for their wealth and splendor. By the marriage of Mary of Burgundy, daughter of Charles the Bold, with Maximilian, archduke of Austria (1477), the Netherlands became a possession of the house of Hapsburg. Her grandson, the emperor Charles V., resigned them to his son Philip II. of Spain in 1555. At this period the Netherlands comprised the dukedoms of Brabant, Limburg, Luxembourg, and Gelderland; the countships of Artois, Hainaut, Flanders, Namur, Zutphen, Holland, and Zealand; the baronies of Friesland, Mechlin, Utrecht, Overijssel, and Groningen; and the margraviate of Antwerp; in all, 17 provinces. They contained 208 walled cities, 150 chartered towns, 6,300 small towns and villages, and 60 fortresses of great strength, besides hamlets, castles, and farm houses. The reformation had made considerable progress among the people during the reign of Charles V., chiefly in the cities, and Philip II. soon after his accession undertook to root out entirely the new doctrines. After his father's abdication Philip remained in the country till August, 1559, when he departed to his Spanish dominions never to return. He left the Netherlands under the government of his sister Margaret, duchess of Parma, as regent, assisted by three councils: a council of state, a privy council, and a council of finance. Of these the council of state was the most important. It consisted at first of five members, among whom were two native nobles of the highest rank and character, the prince of Orange and Count Egmont. Three more were afterward added, the most distinguished of whom was Count Horn. But all the real power of the council was exercised by a secret committee of three, called the *consulta*, and this was entirely under the control of one of its members, Antoine Perrenot, bishop of Arras, afterward Cardinal Granvelle, a native of France, who was greatly detested by the people. The arrogance of Granvelle and the attempt to introduce the inquisition provoked a determined resistance, which was headed by the prince of Orange, Egmont and Horn, and other great nobles. An insurrection of the Protestants broke out in Flanders, Aug. 14, 1566, spread rapidly into other provinces, and lasted about a fortnight, during which great ravages were committed on the churches and monasteries. (See *ICONOCLASTS*.) This outbreak, which was temporarily suppressed by the influence of William of Orange, Egmont, and Horn, and by concessions from the frightened duchess of Parma, determined Philip to resort to the most severe measures to suppress Protestantism; and accordingly the duke of Alva was sent to the Netherlands in 1567, with a powerful army of Span-

ish veterans. Egmont and Horn were arrested and beheaded at Brussels (June 5, 1568), and also many other noblemen of distinction, and for six years the country suffered under a tyranny which for extent and ferocity is almost unparalleled in history. The prince of Orange withdrew to Germany, and appealed to the Protestant princes of that country for aid. They allowed him to raise a force of volunteers, and gave him some pecuniary assistance, as did also Queen Elizabeth of England. He reentered the Netherlands in the latter part of 1568 at the head of an army, and called his countrymen to arms. A long war ensued, distinguished by sieges rather than by battles, and marked by various fortune on both sides. The states of Holland and Zealand conferred almost dictatorial powers on the prince of Orange, with the title of stadtholder; and those provinces equipped a powerful naval force which greatly contributed to the ultimate achievement of Dutch independence. The severity of Alva having driven the greater part of the Netherlands to insurrection, and his attempts to suppress the revolution by force of arms having entirely failed, he was recalled, and departed in December, 1573. His successor, Requesens, was instructed to adopt a milder system of government; but he met with little success, and died of fever in March, 1576. Philip's brother Don John of Austria, the victor of Lepanto, succeeded him as viceroy; but after gaining several victories over the revolutionary forces, he too died of fever (some supposed of poison), Oct. 1, 1578. He was succeeded as regent by his nephew Alessandro Farnese. In the following year (the so-called pacification of Ghent of 1576, for the same purpose, having failed) the provinces of Holland, Zealand, Utrecht, Friesland, Groningen, Overijssel, and Gelderland formed the union of Utrecht, and thus laid the foundation of the republic of the Seven United Provinces. Zutphen and North Brabant subsequently joined the confederation. From this period the history of the Netherlands divides itself into that of Holland and that of Flanders and Brabant, or the southern provinces which remained under the Spanish dominion and adhered to the Roman Catholic faith, and now, though diminished by cessions of territory, constitute the kingdom of Belgium. (See *BELGIUM*.) The assassination of William of Orange, July 10, 1584, was a terrible loss to the struggling commonwealth, which owed its existence mainly to his extraordinary wisdom, prudence, and firmness. The Dutch patriots, however, did not despair. They continued the contest with unabated courage and energy, and finally with a success truly astonishing when we consider the resources of Spain, at that time the first power in the world. Prince Maurice of Nassau, a son of the murdered statesman, though not yet 17 years of age, was chosen to succeed him. He proved to be one of the greatest generals of modern

times, and his career till his death in 1625 was an almost unbroken series of battles, sieges, and victories. About this time the sovereignty of Holland was offered to Elizabeth of England, who declined it, but sent the earl of Leicester to the assistance of the Dutch with a body of troops. Leicester, however, effected little, and was recalled in 1587. Philip II. died in 1598, and his successor Philip III. for some years continued the effort to subdue the revolted provinces. But the Dutch by this time had created a fleet that made them the first naval power of the world. Their ships were manned by hardy and daring seamen, who swept the most distant seas of Spanish commerce, and finally so impoverished the king of Spain by intercepting the remittances of treasure from the colonies, that in 1609 he agreed to a truce for twelve years. During the peace internal dissensions broke out in Holland between the Calvinists and Arminians, whose theological differences were made the basis of political parties, who contended for their respective tenets with great zeal and bitterness. These dissensions were fomented by Maurice, who aspired to become hereditary sovereign, and was already by his influence over the army exercising a species of dictatorship. He was opposed by the venerable Barneveldt, the head of the Arminian party, or as they came to be called the Remonstrants, from a remonstrance which they published in favor of universal toleration. The Calvinist party, of which Maurice was chief, were soon known as Anti-Remonstrants, and those names have continued to be used in Holland to the present day. The Calvinists prevailed in the contest for the political supremacy, and Barneveldt and the famous Grotius, another eminent leader of the Remonstrants, were arrested on charges of treason. After an infamous trial, in which party spite and popular clamor were brought to bear on the judges, Barneveldt was condemned and executed, May 13, 1619, at the age of 71 years. Grotius by an artifice escaped from prison, and took refuge in France. On the expiration of the truce in 1621, the war with Spain was renewed. After the death of Maurice, who was succeeded by his brother Frederick Henry, operations on land were not for some time prosecuted with much vigor, but on sea the Dutch displayed great energy. They attacked Peru with success, and conquered San Salvador and a large portion of Brazil, which at that period belonged to the Spanish monarchy. They also made incessant attacks on the Spanish possessions in the East Indies, and laid the foundations of the Dutch empire in that part of the world. On the general pacification of Europe by the peace of Westphalia in 1648, a final treaty was made with Spain, which acknowledged the independence of the United Provinces after it had been practically maintained for 70 years. This treaty also aggrandized the republic with North Brabant and a portion of Limburg.

Frederick Henry had in the mean while been succeeded by William II. A few years later the republic became involved in war with the English commonwealth, and several great naval battles were fought between the celebrated Dutch commanders Van Tromp, De Ruyter, and De Witt, and the famous English admiral Blake. After his victory near the Goodwin sands, Nov. 29, 1652, Van Tromp sailed along the English coast with a broom at his masthead to indicate his sweeping the channel of English ships. In the final engagement, at the close of July, 1653, Van Tromp was killed and the Dutch were defeated with great loss. Peace was soon after concluded between the two republics, and Holland immediately engaged in a war with Portugal concerning their respective possessions in Brazil, in which many Portuguese vessels were captured. The war ended by the expulsion of the Dutch from Brazil in 1654. In 1665 Charles II. of England declared war against Holland, and hostilities on the ocean were prosecuted with much vigor. Several desperate naval battles were fought with varying success during the years 1665-'6, the advantage on the whole being with the English. In June, 1667, however, De Ruyter sailed up the Thames with his fleet, burnt the shipping at Sheerness and Chatham, and blockaded for a short period the port of London. A month later the peace of Breda ended the war, and in the beginning of 1668 Holland entered into an alliance with England and Sweden to check the growing power of Louis XIV. of France, who had seized upon the Spanish Netherlands. But the fickle and deceitful Charles II., being bribed by Louis, ordered a treacherous attack on a rich Dutch fleet from Smyrna in March, 1672, which was bravely repulsed. On the 17th of the same month he declared war against his late allies, and sent a force to coöperate with the French. Sweden also joined the league against the Dutch, and Louis invaded Holland at the head of 100,000 men commanded by the first generals of the age, and in a few days conquered the provinces of Utrecht, Gelderland, and Overijssel. The Dutch, whose forces did not exceed 25,000 men, were besides divided and weakened by the most violent contests between the partisans of the house of Orange and the opponents of that party, headed by the grand pensionary John De Witt and his brother Cornelius, by whose influence the office of stadtholder had been abolished in 1650 and the states general made the supreme power. The partisans of De Witt proposed to remove the whole nation to the East Indies rather than submit; but the young prince of Orange, William III., afterward king of England, encouraged the people to resist, and declared he would die in the last ditch. He was made stadtholder by acclamation, was intrusted with dictatorial power, and the De Witts were massacred by a mob at the Hague. The desperate resolution was taken to cut open the dikes and let in the ocean to

drown the country and its invaders. This expedient was successful, and the baffled French were forced to retreat with great loss. Peace with England was concluded in 1674, and with France by the treaty of Nimeguen in 1678. The prince of Orange, who continued to hold supreme and almost absolute power in Holland, was married to the princess Mary, daughter of James II. of England, in 1677, and attained the throne of England by the revolution of 1688. During his life, and for several years after his death in 1702, Holland bore a conspicuous part in the wars waged by the European powers against France to check the ambitious designs of Louis XIV. On the death of William III. the anti-Orange party prevailed in Holland, and no stadtholder was appointed. The republic was governed by the states general, the grand pensionary, as the chief executive was styled, being till his death in 1720 the eminent statesman and diplomatist Heinsius. In 1747, the Orange party having regained the ascendancy, William IV. was made stadtholder of the republic; and on his death in 1751 his infant son William V. succeeded to the office, which he held till 1795, when Holland was conquered by France, and the Batavian republic established. During the seven years' war, from 1756 to 1763, Holland remained neutral; but in the progress of the American revolution she became involved in war with England, and her fleet sustained a severe defeat from the English on the Dogger bank in 1781, after a bloody fight. The French revolution found warm partisans in Holland among the anti-Orange faction, and their sympathy and assistance, together with an intense frost which enabled the French army to pass the rivers and canals on the ice in the winter of 1794-'5, rendered the conquest of Holland by Gen. Pichegru an easy task. The Batavian republic, which in its closing years was administered by the director Schimmelpenninck, a statesman and patriot of eminent ability and integrity, terminated in 1806 by the erection of Holland into a kingdom, on the throne of which the emperor Napoleon placed his brother Louis. Louis ruled with moderation and kindness, but his preference of the interests of Holland to those of France gave such offence to his imperial brother, that in 1810 he abdicated, and Holland was incorporated as an integral part of the French empire. On the downfall of Napoleon the prince of Orange, who had been in exile in England, was declared king by an assembly of notables, under the title of William I., with a constitution limiting his power within moderate bounds. The ancient southern provinces, which had remained under Spanish rule at the time of the great revolution of the 16th century, and had subsequently belonged to the house of Austria, were annexed to Holland by the congress of Vienna, with the object of forming a power of sufficient force to serve as a check to the progress of France toward the northeast. The difference

of race, religion, language, and manners, however, prevented the assimilation of the two sections into one nation; and on the outbreak of the French revolution of 1830 the southern provinces revolted, and, aided by the French, established their independence as the kingdom of Belgium, with Leopold of Saxe-Coburg as king. The final settlement between the two kingdoms took place in 1839, when that part of Luxemburg which had been constituted by the congress of Vienna a grand duchy under the king of the Netherlands, was enlarged by a portion of Belgian Limburg. Since the separation the kingdom of the Netherlands has continued flourishing and peaceful, and has made rapid advances in prosperity and opulence. In 1848, after the French revolution of that year, the constitution was still further liberalized, and extensive reforms were introduced. William I. abdicated in 1840 in favor of his son William II., who died in 1849, and was succeeded by William III., the present king. In August, 1862, the states general passed a law for the abolition of slavery in the Dutch West Indies, which went into operation July 1, 1863. During the war between France and Germany the Netherlands maintained a strict neutrality. With the exception of occasional conflicts with the natives in some of their East India colonies, the most important of which was a war with Acheen in the island of Sumatra in 1873-'5, the Netherlands have been engaged in no war with a foreign power since the conclusion of the treaty with Belgium in 1839. The contests between the liberal and conservative parties in regard to questions of internal policy have for several years been very bitter, but, with unimportant exceptions, have been carried on in conformity with the constitution and laws.—See Schiller, *Geschichte des Abfalls der vereinigten Niederlande von der spanischen Regierung*; Bilderdijk, *Geschiedenis des vaderlands* (12 vols., 1832-'9); Leo, *Zwölf Bücher niederländischer Geschichte* (2 vols., 1832-'5); and Motley, "The Rise of the Dutch Republic" (3 vols., 1856), "The History of the United Netherlands," &c. (4 vols., 1860-'67), and "The Life and Death of John of Barneveld" (2 vols., 1874).

NETHERLANDS, Language and Literature of the.

Under the title GERMANIC RACES AND LANGUAGES, the development of the Dutch language, and the relation which it holds to the other languages of the Teutonic group, have been discussed. The Dutch alphabet consists of 23 letters, counting *ch*. It does not include *c*, *q*, *x*, or *y*, which occur only in words derived from other languages. *H* is always an aspirate, and is never written, as in German, merely to lengthen a vowel. *G* and *ch* are nearly alike, resembling in sound the *ch* in the Scotch *loch*; *g* is not quite so guttural. When *l* is preceded by a vowel and followed by a consonant, a slight short *e* is sounded between it and the consonant. *Sch* is not pronounced together as in German, but the *s* and

the *ch* are distinct, as in *schip* (pronounced nearly *skhip*), ship; and when at the end or in the middle of a word it sounds almost like a simple *s*. *V* has always the flat sound of *f*. The other consonants are sounded as in English. The vowels are generally sounded as in German, but are distinguished as long when ending a syllable, and as broad when followed by a consonant in the same syllable. Thus *a* in *man*, man, sounds as in *fat*; in *laten*, to let, as in *psalm*; and *aa* is always long: *e* in *bel*, bell, as in *met*; in *geven*, to give, like *a* in *mate*, and *ee* the same; but *e* at the end of words of more than one syllable is very short, or nearly mute: *i* as in *him*, or if long as *ie* in *grief*: *o* as in German *von*, or if long as in *hope*, and *oo* the same: *u* as in *but*, but if long, at the end of a syllable, like the French *u* or the German *ü*, and *uu* the same. Of diphthongs and other compound vowel sounds, *au* is pronounced like *ou* in *house*; *ei* like *i* in *mine*; *eu* like the German *ö* in *Vögel*, or the French *eu* in *feu*; *ie* as in *grief*; *oe* like *oo* in *boon*; *ou* as in *out*, except that the *u* sound is more distinguishable; *ui* nearly like *oy* in *joy*: of *aai*, the *aa* is long, and the *i* scarcely sounded; of *eeuw*, the *ee* is long (Eng. *ā*), and *uw* follows it like the English *uw*; of *ooi*, *oo* is long as in *hope*, and followed by a short *i* sound; of *ieuw*, *uw* is sounded like *üw* in German, and the *ie* is almost mute; *oei* sounds almost like the French *oui*. *Ai*, sounded like *i* in *mine*, is now out of use, and *ei* is written instead; thus, *keizer* for *kaizer*. The double vowel *ij* must be spoken a little broader than *ei*. This compound has been substituted in recent times for *y*, which is still used in foreign words and generally in writing. A *trema* or diæresis is used to denote that succeeding vowels must be pronounced separately; the circumflex accent indicates that the letter *d* has been omitted, as *Neerland* for *Nederland*; the acute accent, that a vowel has to be emphasized; and the apostrophe is used instead of letters and syllables left out, as *'s* for *des*, of the, and *'rtoe* for *daartoe*, thereto.—Three genders are distinguished, masculine, feminine, and neuter; and four cases, nominative, genitive, dative, and accusative. The definite article is declined as follows: masc. sing. nom. *de*, gen. *des* or *van den*, dat. *den* or *aan den*, acc. *den*; fem. sing. nom. *de*, gen. *der* or *van de*, dat. *der* or *aan de*, acc. *de*; neuter sing. nom. *het*, gen. *des* or *van het*, dat. *den* or *aan het*, acc. *het*; plural for all three genders, nom. *de*, gen. *der* or *van de*, dat. *den* or *aan de* (sometimes *der* in the feminine), acc. *de*. The indefinite article *een* receives when inflected terminations corresponding to those of the definite article singular. The plural in nouns is generally formed by adding *en* to the singular, as *meening*, opinion, *meeningen*, opinions; but nouns ending in *el*, *er*, *aar*, and *ier* take *en* or *s*; those in *em*, *en*, and diminutives in *je*, take *s*; those in *heid* change into *heden*; those in *man* change into *lieden* (*koopman*, pl. *kooplieden*, as in Ger. *Kaufmann*, pl. *Kaufleute*); those in *e* take

only *n*; and those with a broad vowel double the final consonant before taking *en*. In the various cases, nouns remain invariable except the masculine and neuter genitive singular, which take *s*, the neuter dative singular, which receives an *e*, and the dative of masculine and neuter plurals terminating in *s*, which is changed into *en*. Proper names are declined only with the prepositions *van* and *aan*, but have a possessive case in *s*, which is usually connected with it, and separated by an apostrophe only when the name ends in a long vowel; thus, *Pieters boek*, Peter's book, and *Attila's dood*, Attila's death. The Dutch forms compound words with the same facility as the German. It is rich also in diminutives ending in *je*, and forms feminines either by adding *in*, as *een keizer*, an emperor, *eene keizerin*, an empress; or by changing the termination *er* into *ster*, as *een zanger*, a singer, *eene zangster*, a songstress; or by adding *es*, as *een baron*, a baron, *eene barones*, a baroness; or by changing *man* into *vrouw*, as *een koopman*, a merchant, *eene koopvrouw*, a woman merchant. The declension of adjectives is limited to their taking an *e* when preceded by an article terminating in *e* or *er*, or *en* when the article ends in *en* or *es*: thus, *des goeden mans*, of the good man; *der goede vrouw*, to the good woman; *den goeden kinderen*, to the good children. Adjectives are compared by adding *er* for the comparative and *st* for the superlative; but if the adjective ends in *r* in the positive, the comparative is formed by adding *der*. The principal personal pronouns are *ik*, I; *wij*, we; *gij*, thou or you; *hij*, he; *zij*, she; *het*, it; and *zij*, they: the possessives, *mijn*, my or mine; *uw*, thy or thine; *zijn*, his; *haar*, her or hers; *onze*, our or ours; *hun*, your or yours; *haar*, their or theirs: the interrogatives, *wie*, who; *wat*, what; *welke*, *welk*, which; *hoedanige*, *hoedanig*, which (what kind): the demonstratives, *deze*, *dit*, this; *gene*, that; *die*, *dat*, that; *degene* or *diegene*, he who. These are all declined more or less after the manner of the definite article. The first ten cardinal numbers are *één*, *twee*, *drie*, *vier*, *vijf*, *zes*, *zeven*, *acht*, *negen*, and *tien*; from which ordinals are formed by adding *de* or *ste*, as *de vierde*, the fourth, *de achtste*, the eighth.—The infinitive ends in *en*, and whatever precedes this termination is the root of the verb. The indicative present consists of the root itself, with a final *t* in the second person singular and plural and the third person singular, and with the addition of *en* in the first and third persons plural. The imperfect of the indicative and the subjunctive is formed by adding *de*, except when the root ends in *f*, *p*, *k*, *s*, *t*, or *ch*, when *te* is added instead; and when the root ends in *tt* or *dd*, *e* is inserted before the *de*. The present participle is formed by adding *de* to the infinitive, and the past participle by prefixing *ge* (generally) and adding *d* or *t*. The subjunctive present is formed by adding *e* to the root, and the imperative is the root itself. There are four auxiliary verbs: *hebben*, to have;

zijn or *wezen*, to be; *zullen*, to be bound (to be about); and *worden*, to become (to be). The inflection of a regular verb, therefore, is as follows: Active infinitive, *beminnen*, to love; present participle, *beminnende*, loving; past participle, *bemind*, loved; indicative present, *ik bemîn*, I love; imperfect, *ik beminde*, I loved; past indefinite, *ik heb bemind*, I have loved; pluperfect, *ik had bemind*, I had loved; future, *ik zal beminnen*, I shall love, *ik zal bemind hebben*, I shall have loved; conditional, *ik zoude beminnen*, I should love; conditional past, *ik zoude bemind hebben*, I should have loved; imperative, *bemin*, love; subjunctive present, *dat ik beminne*, that I may love; imperfect, *dat ik beminde*, that I might love; passive infinitive, *bemind worden*; participles, *bemind wordende*, *bemind geworden*; indicative present, *ik word bemind*, I am loved; imperfect, *ik werd bemind*, I was loved; past indefinite, *ik ben bemind geworden*, I have been loved, *ik was bemind geworden*, I had been loved; future, *ik zal bemind worden*, I shall be loved; future perfect, *ik zal bemind geworden zijn*, I shall have been loved; conditional, *ik zoude bemind worden*, I should be loved, *ik zoude bemind geworden zijn*, I should have been loved; imperative, *word bemind*, be loved; subjunctive, *dat ik bemind worde*, that I may be loved; imperfect, *dat ik bemind wierde*, that I might be loved; past indefinite, *dat ik bemind geworden zij*, that I (may) have been loved; pluperfect, *dat ik bemind geworden ware*, that I had been loved. Neuter verbs are conjugated with *hebben* when an action is implied, and with *zijn* when expressing a state of existence. The word *it* used in English for impersonal verbs is expressed in Dutch by *het*; but when used in the combination "it is," it is expressed by *daar* or *er*: thus, *het regent*, it rains; *daar* or *er is*, it is. There is a multitude of irregular verbs; their prominent features are, that one class having *ij* in the infinitive take *e* in the imperfect and participle, as *blijven*, to remain, *bleef*, *gebleven*; another with *e* or *i* in the infinitive takes *o* in the imperfect or participle, as *binden*, to bind, *bond*, *gebonden*; a third with *e* in the infinitive and participle has short *a* in the imperfect, as *meten*, to measure, *mat*, *gemeten*; a fourth with *a* in the infinitive and participle has *oe* or *ie* in the imperfect, as *dragen*, to carry, *droeg*, *gedragen*, and *slapen*, to sleep, *sliep*, *geslapen*; a fifth with long *e* in the infinitive has short *a* in the imperfect, long *o* in the participle; a sixth with short *e* in the infinitive has *ie* in the imperfect and short *o* in the participle; a seventh changes only the participle; and an eighth, specially known as irregular verbs, changes both the consonant and the vowel of the root in the imperfect and the participle, as *staan*, to stand, *staand*, *gestaan*; *kunnen*, to be able, *konde*, *gekonnen*. Prepositions, with few exceptions, govern the accusative.—LITERATURE. The first development of the vernacular literature of the Netherlands was Flemish rather than Dutch. The begin-

ning of Dutch literature proper (besides which the Netherlands boast of a host of eminent writers in Latin, embracing such names as Erasmus, Grotius, Chr. Huygens, Spinoza, and Boerhaave) dates from the 16th century. But as early as the beginning of the 15th literary persons formed associations for holding poetical tournaments and giving theatrical representations. They were known as the chambers of the *rederijkers*, presumably so called after the French *rhétoriciens*, which term then signified nearly the same as "poet." Only the *rederijkerskamer* of Amsterdam attained the character of a literary academy. Three members of it, Coornhert (1522-'90), Spiegel (1549-1612), and Roemer Visscher (1547-1620), may be considered the real founders of modern Dutch literature. Coornhert's productions are mostly treatises on morality and theology and poems. The posthumous poem of Spiegel, the *Hartspiegel*, is ethical. This triumvirate rendered great service by the grammatical works published under their direction by the Amsterdam *kamer*. Linguistic labors of still greater importance were the *Thesaurus Teutonicæ Linguae* by the celebrated printer Plantin (1514-'89), and the *Etymologicum Teutonicæ Linguae* by Cornelis van Kiel (Cornelius Kilianus). At the beginning of the 17th century, and for many years later, Holland, a powerful, wealthy, and free commonwealth, was preëminently the literary country of Europe. The devotion of the learned to the ancient languages was ardent and almost without parallel elsewhere; but a golden age of vernacular literature was ushered in by P. C. van Hooft (1581-1647), who gave a sweetness and harmony before unknown to Dutch speech. His amatory and Anacreontic lines have not been excelled by any later writer; and his *Nederlandsche Historien*, embracing the years between 1555 and 1587, is a model of stately historical narrative. Jacob Cats (1577-1660), or "Father Cats," as his countrymen love to style him, wrote for the multitude, and became their favorite. But J. van den Vondel (1587-1679) is the greatest poetical name of the century. He wrote much, dramas, lyrics, and satires, and had a multitude of disciples and imitators, one of the best of whom is Antonides van der Goes (1647-'84). J. Oudaan (1628-'92) is the author of two dramas worthy of note, *Johanna Gray* and *Koning Konradijn*; and other dramatic writers are Bredero (died in 1618), S. Coster, W. van der Nieuwelandt (1584-1635), the Fleming J. Zevecot (1604-'46), whose *Belegh van Leyden* ("Siege of Leyden") may still be read with pleasure, and L. Rotgans (1645-1710), whose dramas are much better than his tedious epic, *Willem III.* A man of large learning and much descriptive talent, C. van Huygens (1596-1687), produced some not unpleasing didactic poems, like the *Zedenprinten* ("Pictures of Manners"), *Hofwijk*, and *Voorhut*, which with others he included in a collection bearing the title of *Korenbloemen* ("Blue-

bottles"). A rhymed narrative, the *Masker van der Wereld*, by the Flemish Jesuit A. Poirtiers (1606-'75), was once very popular. The *Lof der Geldzucht* ("Eulogy of Avarice") and the domestic elegies of J. de Dekker (died in 1663) are still frequently quoted; *Roselijns Oochies* is a pretty idyllic effusion by Joncktyns (born 1600); and the pastoral poems of Wellekens (1658-1726) are graceful and imaginative. The almost universal use of Latin, as a language through which a vastly larger audience could be reached, left little room for Dutch prose. Several translations of the Bible, both from the original tongues and the Vulgate, some Biblical commentaries, and other theological treatises, met with a wide circulation. The *Batavische Arkadia* of J. van Heemskerk (1597-1656), suggested by the *Decamerone* of Boccaccio, is the only work that deserves the name of a romance. Besides Hooft, the historians are P. C. Bor (1559-1635), E. van Meteren (1535-1612), L. van Aitzema (1600-'69), and G. Brandt (1626-'85). The Dutch navigators, as Barentz and Heemskerk in their search for a northeast passage, Gerritszoon in the Australian regions, and Noort and Spilbergen in the extreme Orient, added much to geographical knowledge in this century. Many of these explorers wrote narratives of their voyages, versions of which appeared in various languages. Among these works are J. Nieuwhof on China (1665), P. Baldeus on Ceylon and Malabar (1672), M. G. de Vries on Japan (1646), G. Schouten on the East Indies (1696), C. de Bruyn on eastern Europe and western Asia (1698-1711), and W. Bosman on Guinea (1704).—The 18th century offers a marked contrast to its predecessor. The literature of the 17th century gave way in the 18th to imitation of French models. Few authors escaped this contagion. One of these is H. C. Poot (1689-1733), the farmer poet, whose style is pure and natural, and whose erotic and idyllic verses are marked by ease and liveliness. His most striking pieces, perhaps, are *Wachten* ("Watching") and *Landleven* ("Rural Life"). A Biblical epic which has considerable merit, but which was followed by bad imitations, is the *Abraham de Aartsvader* of A. Hoogvliet (1687-1763). The *Rottestroom* of D. Smits (1702-'52) also originated a school known as the stream poets, who sang the beauties of all the Dutch rivers. Of the two brothers W. van Haren (died in 1768) and O. Z. van Haren (died in 1779), the elder left a legendary, knightly tale in verse, *Gevalen van Friso*, and some lighter compositions, among which are *Leonidas*, *Menschelijk leven* ("Human Life"), and the *Hof van den vrede* ("Court of Peace"); the younger was the author of two tragedies and a lyrical epic, *De Geuzen*, woven out of the popular national ballads. A sort of transition poetical period, the dawn of the day of Bilderdijk and Tollens, begins with 1780. It was initiated by J. Bellamy (1757-'86), whose *Roozje* is the most touching and beautiful bal-

lad in the language, and was further characterized by the astronomer P. Nieuwland (1764-'94), whose *Orion* is a stately and in some portions sublime epic, and by H. van Alphen (died 1803), whose poems for children have been frequently reprinted. The purest prose of the century is that of J. van Effen (1684-1735), who possessed not a little of the humor and grace of his model, Addison, of whose chief work his *Hollandsche Spectator* is an imitation. The romance style was developed by two women, A. Deken (1741-1804) and E. Bekker (1738-1804); their novels, written in conjunction, though somewhat diffuse, are successful pictures of Dutch life and manners. The lengthened *Vaderlandsche historie* of J. Wagenaar (1709-'73) is impartial and trustworthy, but the diction is rather dull and heavy. The other historians are G. van Loon (born 1683), S. Stijl (1731-1804), and A. van Kluit (1737-1807), who wrote a very learned *Historia Critica Comitatus Hollandiae et Zelandiae*, and a *Historie der hollandsche staatsregering*. The *Vaderlandsche woordenboek* (1785-1800), in nearly 40 volumes, by J. Kok, is a treasury of information concerning the history and topography of Holland. In philology L. Ten Kate (1674-1731) anticipated many of the ideas of Grimm and the later Teutonic school. He and B. Huydecoper (1695-1778), who edited one or two of the old Flemish chronicles, were of great service to their native tongue. D. van Hoogstraaten (1658-1724) attained some eminence as a lexicographer. In science the philosophers W. J. 's Gravesande (1688-1742), N. Hartsoeker (1656-1725), and P. van Musschenbroek (1692-1761) gained a European renown; as did those disciples of Boerhaave, P. Camper (1722-'89) and G. van Swieten (1700-'72).—The modern revival of Dutch letters is coincident with the French revolution, having fairly commenced some little time before the opening of the 19th century. Rhijnvis Feith (1753-1824) did much toward bringing in this new epoch; his reputation is still maintained by a series of admirable historical *Oden en gedichten*. The *Taal, Schilderkunst*, and other productions of C. Loots (1765-1834) resemble the style of Helmers, but are much superior in energy and force. E. A. Borgers (died in 1820), a theologian, A. Simons (died in 1834), and J. Kantelaar (1759-1821) have also left several tasteful and polished lyrics. But the greatest of modern, if not of all Dutch poets is Willem Bilderdijk (1756-1831). The most remarkable of his multitudinous works is an epic entitled *De ondergang der eerste wereld* ("Destruction of the First World"), of which only the first five books were completed. The same author's *Geschiedenis des vaderlands*, in prose, was published after his death by B. F. Tijdeman. Another very popular poet is H. C. Tollens (1780-1856); especially admirable are his narrative poem *De oerwintering der Hollanders op Nova Zembla*, an account of Barentz's famous expedition in 1594-'6, his tragedy *De*

hoekschen en kabeljaauwschen, and his stirring national lyric, the *Wapenkreet*. The example and influence of Bilderdijk and Tollens have given rise to a number of minor bards. Some of the most meritorious are J. F. Bosdijk (died 1850); B. H. Lulofs (1787-1849), author of the *Watersnood*; W. Messchert (died in 1844), whose *De goude bruiloft* is justly praised; H. A. Spandaw (died in 1855), of whose works the *Neêrlands zeeroem* and the *Vaderlandsche poezij* are popular; W. de Clercq (1793-1844), a celebrated improvisator; J. Immerzeel (1776-1841), also known for his biographies of the artists; B. Klijn (1764-1829); A. C. W. Starling van den Wildenborch (1767-1840), the best modern humorist, of whose peculiar manner his *Iamben* and *Zephir en Cloris* are good examples; and P. Moens (1767-1843). Modern lyrical and descriptive poets are I. da Costa, a Jew, who after the decease of Tollens occupied the highest place in the modern Dutch Parnassus; C. G. Withuys, S. J. van den Bergh, J. van Beers, J. A. Alberdingk Thijm, L. van den Broek, and J. J. L. ten Kate. Among those who wrote for the stage in the latter part of the last century were S. J. Wiselius (1769-1845), J. Nomsz, J. van Walré (1759-1837), H. H. Klijn, and A. Loosjes (1761-1818), the last of whom also gave to the world some pleasant tales and sketches. Still later dramatists are the prolific comedy writer Ruysch and J. Hilman. The novels of E. Kist (1753-1822) and A. Fokke (died in 1812) are still much read; but they have been excelled by the romances of J. van Lennep (1802-68), a son of D. J. van Lennep (1774-1853). His fame was established by his *Nederlandsche legenden*, and his popularity was increased by the novels *De roos van Dekama* and *De lotgevallen van Klaasje Zevenster*. Several of his works have been translated into English. He seems to have successfully combated the undue love in his country for imitations of French standards. He selected Byron and Walter Scott as his models, and his novels and historical romances show that he did not servilely copy them, but strove to retain a truly national spirit. Van der Hage is his equal in historical narrative, but is not as felicitous in pure fiction, wherein Adriaan Bogaers stands much nearer to him in talent and fame. Bogaers's most celebrated productions are *Jochebed* and *De togt van Heemskerk naar Gibraltar*. Novelists of note of recent times, among others, are Schimmel, the author of *Mary Hollis*, Hofdijk, and Ten Brink, who has written masterly descriptions of colonial life in the East Indies. The names of Da Costa, Van Oosterzee, Schultjes, Ter Haar, and Tiedeman have won distinction for theological learning. Jurisprudence and political economy have been ably represented by Den Beer Poortugael, Noordziek, De Bruyn Kops, Heineken, Den Tex, and Wintgens. Valuable medical works have appeared from the pens of Donkersloot, Cornelius, Huet, Eschauzier, and Berns. Chem-

istry, pharmacy, and the natural sciences generally have been enriched by the labors of Bleeker, Harting, Van Otterloo, Vorsterman van Oijen, Suringar, Opwyda, Luijten, and Mulder. Philosophical works have been contributed among others by Kinker, Heringa, Vitringa, Wijek, Spruyt, Opzoomer, Burger, and Snellen. Steijn Parvé, Bleek van Rijsewijk, and Vorstman have written on the science of education. Ancient and oriental languages, as well as mythology and archæology, have received fresh contributions from Van Herwerden, Boot, Francken, Van Cappelle, Ekker, Rijnenberg, Grashuis, Kroon, and De Goeje. Numerous books have appeared to facilitate the study of modern languages. Among them are specially noteworthy Halbertsma's *Lexicon Frisicum*, Oudemans' *Bijdrage tot een middel- en oud-nederlandsch woordenboek*, and Winkler's *Algemeen nederduitsch en friesch dialecticon*. The present period has produced an abundance of historical, geographical, and ethnological works. Bladzijden's *Uit de geschiedenis van Neêrlands roem en grootheid*, Kemper's *Geschiedenis van Nederland na 1830*, Muller's *De Staat der vereenigde Nederlanden in den jaren zijner wording 1572-94*, Hofdijk's *Het nederlandsche volk geschetst in de verschillende tijdperken zijner ontwikkeling*, and Elbert's *Leven van Willem den Eersten, Prins van Oranje*, have thrown considerable light on the history of the Netherlands. Other historical works of value have been contributed by Nugens, Wijne, Veth, Van den Bergh, Ter Haar, De Jonge, Meinsma, Witkamp, Doorenbos, Groen van Prinsterer, Gericke van Herwijnen, Van Vloten, and Vreede. Among works on mathematical, mechanical, and military science, Kuipers's *Geschiedenis der nederlandsche artillerie van de vroegste tijden*, Wageningen's *Leerboek der analytische meetkunst*, Reuven's *De Waal en Rijndijken*, and Grothe's *Mechanische technologie* may be mentioned as excellent compendiums of the special branches.—See Mone, *Uebersicht der niederländischen Volksliteratur älterer Zeit* (Tübingen, 1838); Jonckbloet, *Geschiedenis der midnederlandsche letterkunde* (Amsterdam, 1851 et seq.); Hofdijk, *Geschiedenis der nederlandsche letterkunde* (1856); and Van Vloten, *Schets van de geschiedenis der nederlandsche letteren* (1871).

NETSCHER, Gaspar or Kaspar, a Dutch painter of German origin, born in Heidelberg about 1639, died at the Hague, Jan. 15, 1684. He was the son of a sculptor, who had fled from persecution in Bohemia, was a pupil of Koster at Arnhem, and afterward of Gerard Terburg, lived some years in Bordeaux, where he married, and in 1661 settled at the Hague. He excelled in genre pictures and portraits.—His sons, THEODORE (1661-1732) and CONSTANTINE (1670-1722), were also eminent painters, especially of portraits. The former was born in Bordeaux, lived in England from 1715 to 1722, was popular at court, and became rich.

NETTEMENT, Alfred François, a French author, born in Paris, July 22, 1805, died there, Nov. 15, 1869. He founded at Paris in 1848 *L'Opinion publique* newspaper, which was suppressed after the *coup d'état* of Dec. 2, 1851, when he was arrested with other opposition members of the legislative assembly. He published a great number of historical, biographical, and miscellaneous works, including *Mémoires sur la duchesse de Berri* (3 vols., 1837); *Essai sur le progrès du Catholicisme en Angleterre*, with a translation of Cardinal Wiseman's lectures (2 vols., 1839); *Histoire de la littérature française sous la royauté de juillet* (2 vols., 1854); *Histoire de la conquête d'Alger* (1856), which obtained in 1869 the second Gobert prize; and *Histoire de la restauration* (8 vols., 1860-'72).—His brother FRANCIS (born in 1808) has published *Nouvelle Histoire de la révolution de 1789* (2 vols., 1862), and other writings.

NETTLE (Ang. Sax. and Dutch, *netel*), the name of plants of the genus *urtica*, distinguished for the stinging quality of their minute hairs. Prior shows that the word in different languages originally meant "that with which one sews," the Germanic and Scandinavian nations having in former times used the nettle fibre as thread, as was done by the Scotch in the 17th century. The genus *urtica* (the classical Latin name, from *urere*, to burn) gives its name to the family *urticaceæ*, as to the limits of which there is a great difference of opinion; while some botanists make the *urticaceæ* a very comprehensive order, including as subfamilies the elms (*ulmaceæ*), the breadfruits, mulberries, and figs (*artocarpeæ* and *moreæ*), the nettles and allied genera (*urticeæ*), and the hop and hemp (*cannabineæ*), others regard these as entitled to rank as families, and restrict the *urticaceæ* to some 40 genera allied to the nettles. The genus *urtica* consists mostly of herbaceous plants (a few are trees), all supplied with stinging hairs; they have a bland, watery juice, and a tough, fibrous bark; the leaves are opposite, and the flowers are monœcious or dioecious. Belonging to the apetalous division of exogenous plants, the structure of the flowers is exceedingly simple; the staminate flower consists of four sepals and stamens, in the centre of which is the cup-shaped rudiment of a pistil; the pistillate flower has four sepals, the two inner of which are larger, enclosing the one-celled ovary, which in fruit is an akene, surrounded by the membranaceous enlarged inner sepals. The stinging hair of the nettle, when magnified, is seen to consist of a single cell, bulbous at the base, where it is surrounded by cells of the epidermis, and terminated by an exceedingly sharp and fragile point, which breaks off after entering the skin and allows the irritating juice contained in the cell to flow into the wound. If the plant be grasped roughly, the hairs are broken off before the point can penetrate the skin, and little or no pain results. There are but five species of *urtica* proper in the Atlantic states, and two of these are intro-

duced from Europe. The common small nettle of Europe (*U. urens*), which is chosen to illustrate the genus, is found near dwellings in the older states; it is a monœcious, annual species, 8 to 12 in. high, with not very numerous stings. The other introduced species is the common

Small Nettle (*Urtica urens*), showing Staminate and Pistillate Flowers.

nettle (*U. dioica*), a perennial, 2 to 3 ft. high, with its staminate and fertile flowers in much-branched spikes on different plants; this is so well armed with stings that, as the old herbalist Culpepper quaintly remarks, "it may be found by feeling on the darkest night." Of the indigenous species, the slender nettle (*U. gracilis*) is a perennial, 2 to 6 in. high; *U. capitata* is a southern species, 3 to 5 ft. high; and *U. chamaedryoides*, from 6 to 30 in. high, with dense globose flower clusters, is western and southern. The young shoots of nettles are used to some extent in this country, but more in Great Britain, as a pot herb or greens, and in former times the plants were blanched by earthing up, as is now practised with sea kale. Animals will not eat living nettles, unless the plants are very young; but when made into hay they are eaten readily, and they are regarded as so productive of milk that in Sweden and Russia they are sometimes cultivated as fodder plants. The fibre of the plants is considered superior to that of flax, but on account of its small quantity and the difficulty of separating it, little nettle cloth is now made; in the northern parts of Europe the fibre is used for fish lines and other small cordage, and to some extent for fabrics. Several tropical species are useful for their fibres. An Australian species, *U. gigas*, is a tree 120 to 140 ft. high, with leaves 12 to 15 in. broad, which are abundantly furnished with stings and capable of causing great suffering. Stinging with nettles to "let out melancholy" was prescribed by the old writers. The devil's-leaf, *U. urentissima* of Timor, is so violently poisonous that

its effects last for many months, and sometimes cause death. The wood nettle, formerly *U. Canadensis*, but now placed in the genus *Laportea*, has been called American ramie. A closely related genus, *pilea*, includes the richweed, *P. pumila*, formerly *U. pumila*, a smooth plant with translucent stems, quite common in moist and shady places.—The false nettle, *Bahmeria cylindrica*, which is common in moist ground all over the country, has the general aspect of the nettles, but is without stings; to this genus belongs the plant furnishing the China grass, and better known in this country as ramie. (See RAMIE.) Nettle tree is one of the names of *celtis occidentalis*. (See HACKBERRY.) Dead nettle is the common name for plants of the labiate genus *Lamium*.

NETTLE RASH (*urticaria*), an eruptive disorder characterized by the appearance of patches whiter or redder than the surrounding skin, and attended with intense itching. The disease has been divided into three varieties: *urticaria febrilis*, *U. evanida*, and *U. tuberosa*. The febrile variety is preceded by a feeling of general uneasiness, headache, nausea, and vomiting. These symptoms are followed by a troublesome itching and the appearance of an eruption, commonly most abundant about the shoulders, loins, or thighs. The patches are irregular in size and form, sometimes rose-colored with whitish border, sometimes white with rose-colored border, sometimes few in number, sometimes covering the greater part of the surface, and giving rise on the face to great disfigurement and a feeling of stiffness and tension. The patches are evanescent, rapidly disappearing, but only to give place to a new eruption. For the first day or two the disease is apt to be attended with a little fever, but this soon subsides, and after a variable time, generally about a week, the eruption disappears, leaving no traces. In *U. evanida* there is no febrile movement, and the disease is frequently chronic, the eruption often appearing and disappearing several times a day, and frequently assuming the appearance of long wheals as if produced by a whip. *U. tuberosa* is the rarest and the most severe of the forms of nettle rash, in which the eruption is in the form of red swollen patches of the breadth of the hand, attended with an intolerable itching. The patches extend deeply into the skin, are numerous, and produce a very disagreeable feeling of swelling and stiffness. The rash commonly shows itself in the evening to disappear in the morning, leaving a sense of weakness and prostration. It occurs chiefly in habits impaired by excess, and its course is often tedious and intractable.—Nettle rash is most common in nervous persons with a delicate and irritable skin, and consequently in women and children. Its most frequent cause is some irritation of the digestive organs; with some persons the use of a particular article of diet is invariably followed by an eruption of nettle rash, the offending article

varying greatly in different cases, and only to be detected by experience. There are some ordinary articles of diet, as mussels, crabs, several of the richer varieties of fish, &c., which act as true poisons in certain individuals, producing a violent eruption of *urticaria*. Here the symptoms are often excessively severe, the patient suffering from intense headache and giddiness, violent nausea and vomiting, colicky pains in the stomach and bowels, free purging, &c. Sometimes there are violent pains in the back and limbs, sometimes a total loss of sensation and motion. The febrile reaction is often severe, and the eruption is general, attended with great swelling and violent itching and tingling. In ordinary febrile *urticaria*, rest, attention to diet, a cooling regimen, and the use of the tepid bath, are all that is necessary. Occasionally an alkaline wash may be found useful in relieving the itching. *U. evanida* is an intractable complaint, and is best treated by strict regulation of the diet. In the severer forms of nettle rash produced by fish poisoning, the poison should be got rid of by stimulating emetics.

NETTLETON, Asahel, an American clergyman, born in North Killingworth, Conn., April 21, 1783, died May 16, 1844. He graduated at Yale college in 1809, studied theology, and in 1817 was ordained. He had intended to become a missionary, but the effect produced by his preaching was so powerful that he was induced to engage in evangelization at home. He preached revivals with great success in more than 40 towns in Connecticut, Massachusetts, and New York. In 1822 he had an attack of typhus fever, from which for a long time he was not expected to recover. He resumed his active labors in 1824, and in the same year published a volume of "Village Hymns." In 1827 he went to Virginia for the sake of his health, and returning in 1829 preached in New England and New York till 1831. In the spring of that year he went to England, also visiting Scotland and Ireland. Returning in 1832, he was appointed professor of pastoral duty in the newly organized theological seminary at East Windsor; he did not accept the office, but took up his residence in the place, and lectured occasionally. In later life he opposed the doctrinal views of the New Haven school of theology.

NETTLE TREE. See HACKBERRY.

NEU-BRANDENBURG, a town of Germany, in the grand duchy of Mecklenburg-Strelitz, at the N. E. extremity of the Tollens lake and on the Hamburg and Stettin railway, 53 m. W. N. W. of Stettin; pop. in 1871, 7,245. It has a gymnasium, a *Realschule*, four beautiful Gothic gates, two churches (one of which, the Gothic church of St. Mary's, has recently been restored), a theatre, and a palace. The chief manufactures are tobacco, chemical products, playing cards, cottons, and woollens, and there is a large trade in wool.

NEU-BREISACH. See BREISACH.

NEUCHÂTEL, or *Neuchâtel* (Ger. *Neuenburg*).
I. A W. canton of Switzerland, consisting of the former principality of Neuchâtel and the county of Valengin or Valendis, bounded N. and N. E. by the canton of Bern, S. E. by Fribourg and Vaud, S. by Vaud, and W. and N. W. by France; greatest length 36 m., greatest breadth $13\frac{1}{2}$ m.; area, 312 sq. m.; pop. in 1870, 97,284. Several ridges of the Jura mountains traverse the canton. The lake of Neuchâtel, 28 m. long, 7 m. wide, and 400 ft. deep, separates the canton from Fribourg and Vaud, and is connected with the Rhine by several smaller lakes and streams. Wine, fruit, hemp, flax, and grain are the principal products, but the grain crop is not sufficient for home use. The raising of cattle is the most important branch of rural industry. With the exception of about 11,500 Roman Catholics, 1,000 of other Christian denominations, and 700 Jews, the people belong to the Reformed church. French is the prevailing language. Watch making (chiefly at Chaux-de-Fonds and Le Locle), lace making, and cotton manufacture are the leading industrial pursuits. The constitution of the canton is democratic.—Neuchâtel belonged to Burgundy until 1032, when it became part of the German empire. After having been a fief of the counts of Fribourg and the margraves of Hochberg, it became a possession of the Longueville family, and after its extinction in 1707 was inherited by Frederick I. of Prussia, as successor to the rights of the house of Orange. It remained under the house of Hohenzollern as a principality with a separate government till 1806, when Napoleon received it in exchange of territory from Frederick William III., and gave it as a principality to Marshal Berthier. In 1814 the king of Prussia regained possession of Neuchâtel, and procured its admission into the Swiss confederacy, it being the only canton with a monarchical constitution. In 1848 a revolutionary movement severed the connection with the house of Prussia; and an attempt of the royalist party in 1857 to reinstate the royal authority having been frustrated, the independence of the canton was at last recognized by Frederick William IV., May 26, 1857. **II.** A town, capital of the canton, at the embouchure of the river Seyon into the lake of Neuchâtel, 25 m. W. of Bern; pop. in 1870, 13,321. It is picturesquely built on a steep slope of the Jura, and contains many fine buildings. An

ancient castle on the heights has been converted into public offices; the Gothic church adjoining the castle contains a monument to the reformer Farel. There is a museum, with a fine picture gallery; a public library with 30,000 volumes, and having many manuscript

Castle of Neuchâtel.

letters of Rousseau; a college in which Agassiz was once professor; an observatory famous for its geodetical labors; an orphan asylum and two hospitals munificently endowed by private citizens, one of whom, David Pury, in 1786 left 4,000,000 livres to these institutions and for other public purposes; his statue stands in front of the gymnasium. The principal manufactures are clocks and watches, paper, lace, straw hats, and spirits.

NEUHOF, *Theodor von*, baron, a German adventurer, born about 1686, died in London, Dec. 11, 1756. He was the son of a Westphalian nobleman, studied in Cologne, was compelled to leave that city on account of having killed in a duel a young man of high family, and obtained a lieutenancy in the Spanish army in Africa. He fell into the hands of the Moors, and is believed to have been employed during 18 years as interpreter by the dey of Algiers. In 1735 he led two regiments, chiefly Tunisians and Algerians, to Corsica to assist that island against Genoa, and ingratiated himself so much with the Corsicans that they elected him king, April 15, 1736, under the name of Theodore I. He succeeded in securing the alliance of the Netherlands; but the French coming to the assistance of the Genoese in 1738, the Corsicans were again subdued, and Neuhof fled. In 1741, when the French left the island, he in vain endeavored to regain his power, and spent the remainder of his life in England, where shortly before his death he was released from prison by Walpole, who raised a subscription which enabled him to compromise with his creditors. There are other versions of Neuhof's life and

adventures, but the above is most generally credited. He left a son who assumed the name of Col. Frederick, was in the service of the duke of Würtemberg, published two historical works on Corsica, and shot himself in Westminster abbey, Feb. 1, 1796.

NEUILLY, a town of France, in the department of Seine, on the right bank of the river Seine, $1\frac{1}{2}$ m. N. W. of the enceinte of Paris; pop. in 1872, 16,277. The river is here crossed by a handsome bridge of five arches, each of 120 ft. span. The park, which extended for some distance along the Seine, was formerly a favorite resort of the Parisians, but has been cut up into villa sites. The principal object of interest is the ruined palace, once the property of the Orleans family, and the residence of Louis Philippe. It was destroyed by the populace, Feb. 25, 1848, with the exception of one wing. Louis Philippe adopted the title of count of Neuilly during his exile. Several encounters took place at Neuilly in 1871 between the army of the commune and the Versailles troops.

NEUKOMM, Sigismund, chevalier, a German composer, born in Salzburg, July 10, 1778, died in Paris, April 3, 1858. He was educated by his kinsmen Michael and Joseph Haydn, and became in 1804 leader of the orchestra of the German opera in St. Petersburg, but was soon obliged to resign on account of ill health. He returned to Vienna in 1808, and subsequently he lived in Paris, in the house of Talleyrand, whom he accompanied in 1814 to the congress of Vienna. In 1816 he went with the duke of Luxemburg to Rio de Janeiro, and became a teacher of music at the Brazilian court. In 1821 he returned to Talleyrand's house, and, after visiting Italy and other parts of the continent, accompanied his patron in 1830 to England. Subsequently he again travelled extensively, and spent several years in Switzerland. During the latter part of his life he was partially blind, and resided alternately in London and Paris. His oratorio of "Mount Sinai," produced at Derby in 1831, and "David," at Birmingham in 1834, are popular. He also produced an immense number of cantatas, songs, psalms, voluntaries for the organ, symphonies, quartets, sonatas, &c., his compositions, vocal and instrumental, amounting to more than 800.

NEUMANN, Karl Friedrich, a German orientalist, born of Jewish parents at Reichmannsdorf, near Bamberg, Dec. 22, 1798, died in Berlin, March 17, 1870. He studied at Heidelberg, Munich, and Göttingen, and in 1822 was appointed professor of history at Spire, but was compelled on account of his liberal views to retire. He next devoted several years to oriental languages, particularly the Chinese and Armenian, and in 1829-'30 visited China to make a collection of works by native authors. He returned to Europe with 10,000 volumes, besides about 2,500 for the royal library of Berlin. In 1831 he became professor at Munich, lecturing on the Armenian and Chinese languages, and on geog-

raphy, ethnography, and history. He joined the liberals during the commotions of 1847-'8, and in 1852 was removed from his professorship. In 1863 he took up his residence in Berlin. He wrote in German, French, and English, into which languages he made many translations from the Armenian and Chinese, and edited Gützlaff's *Geschichte des chinesischen Reichs*. Among his works are: *Mémoires sur la vie et les ouvrages de David, philosophe arménien* (Paris, 1829); "History of Vartan by Elisæus," and Vahram's "Chronicle of the Armenian Kingdom of Cilicia," from the Armenian (London, 1830); "Catechism of the Shamans," from the Chinese (1831); "History of the Chinese Pirates" (1831); *Pilgerfahrten buddhistischer Priester aus China nach Indien* (Leipsic, 1833); *Lehrsaal des Mittelreichs* (1836); *Asiatische Studien* (1837); *Geschichte des englisch-chinesischen Kriegs* (1846); *Die Völker des südlichen Russland* (1847); *Beiträge zur armenischen Literatur* (1849); *Geschichte des englischen Reichs in Asien* (2 vols., 1857); and *Geschichte der Vereinigten Staaten von Amerika* (3 vols., 1863-'66). A translation of his "Hoei-Schein, or the Discovery of America by Buddhist Monks in the Fifth Century," was published in London in 1874.

NEURALGIA (Gr. *νεῦρον*, nerve, and *ἄλγος*, pain), an affection of which pain is the essential and characteristic feature, without visible alteration of the tissues or organs in which it is seated, and which depends on some disease affecting the structure or function of the nerves or of their centres. The varieties of neuralgia are very numerous. Some are distinguished according to the nerve affected; as neuralgia of the trifacial nerve, commonly called tic douloureux; sciatica, or neuralgia of the sciatic nerve; intercostal neuralgia, affecting the intercostal nerves, &c. Other varieties are described according to the locality which is the seat of pain; as gastralgia, or pain in the region of the stomach; nephralgia, or pain in the region of the kidneys, &c. Other varieties again are indicated by the causes which produce them; as miasmatic neuralgia, the neuralgia caused by marsh miasm; saturnine neuralgia, the neuralgia produced by the poison of lead, &c. The causes of neuralgia may be classified as constitutional and local. The principal constitutional causes are: 1, an impoverished condition of the blood, resulting either from hæmorrhage or the exhausting effects of disease, such as fevers, chlorosis, &c.; 2, the miasm of paludal regions; 3, the *materies morbi* of rheumatism; 4, the virus of syphilis; 5, the circulation in the blood of poisonous secretions, such as urea and bile; 6, the poisonous effects of lead, and probably of some of the other metals; 7, the functional derangement of the nervous system in the disease known as hysteria. The local causes are: 1, inflammation of the delicate fibrous sheath which envelopes the nerves, called the neurilemma; 2, the development of tumors near the origin, or along the course, or

amid the ramifications of the nerves, as neuromata, fibrous tumors growing from the nerve sheath, and cancerous, aneurismal, cartilaginous, or bony tumors, so situated as to stretch or press upon the nerves; 3, the bulbous expansion of the extremities of divided nerves, occurring after amputation, and causing painful stumps; 4, the pinching of nerves in the cicatrices or scars of lacerated wounds.—The successful treatment of a neuralgia depends of course on a correct appreciation of the causes that produce it. Where it arises from constitutional causes, it is generally amenable to treatment. The neuralgia that depends on an impoverished state of the blood yields almost invariably to iron tonics, good diet, and outdoor exercise; that which arises from the effects of paludial poison disappears rapidly under the use of quinine; neuralgia of rheumatic origin is ordinarily controlled by the preparations of colchicum, the alkalis, alkaline and sulphur baths, &c.; while the neuralgia caused by lead poison has its specific antidote in the iodide of potassium, a remedy which is useful also in the neuralgia of syphilitic origin. The neuralgia which occurs in hysteria yields, like most of the protean phenomena of that disease, to the mineral tonics, electricity, shower baths, and exercise. Before speaking of the treatment of the forms of neuralgia caused by local disease, it is to be remarked that the seat of pain in these cases does not always correspond with the location of the cause of irritation. For instance, a tumor within the cranium may produce pain at the extremity of the sensitive nerves, near the origin of which it is located; or pressure in the course of a nerve may cause pain in its ultimate ramifications. Where neuralgia is caused by irritation near the origin of the nerves, in the brain or spinal cord, its radical cure is generally impracticable; where it depends on the pressure of tumors that can be removed, the pain will generally disappear with the removal of the cause. In inflammation of the nerve sheath, local counter-irritation, by cups, blisters, issues, setons, &c., usually gives relief, and generally effects a cure. The neuralgia of painful stumps and scars, and of obstinate cases of inflammation of the neurilemma, requires surgical interference, such as reamputation, removal of the cicatrix, or excision of a portion of the diseased nerve. Temporary relief may be given in all forms of neuralgia by the administration of powerful anodynes. Those most commonly used are morphine, the active principle of opium, and aconitine, the active principle of the *aconitum napellus* or monkshood. These may be used internally or externally. A solution of morphine injected into the areolar tissue beneath the skin, near the seat of the neuralgia, gives more prompt relief than when given by the stomach. Aconitine is generally used externally, in the form of an ointment, rubbed upon the affected part. In most cases it rapidly relieves the neuralgic pain.

NEUREUTHER, Eugen, a German painter, born in Munich, Jan. 13, 1806. He studied under his father, Ludwig Neureuther, was employed by Cornelius in the arabesques and other embellishments of the Trojan hall in the Glyptothek, and distinguished himself by illustrating Goethe. He visited Rome in 1837; from 1848 to 1856 he was director of the porcelain works in Nymphenburg, and subsequently became professor at the academy of Munich. Among his finest productions are designs after Wieland's "Oberon" in the Königsbau at Munich, and the external embellishments of the polytechnic institute, which was designed by his brother Gottfried, an eminent architect.

NEUROPTERA (Gr. *νεῦρον*, nerve, and *πτερόν*, wing), an order of insects characterized by powerful jaws, four reticulated, membranous, naked wings, and the absence of sting or piercer. They include the dragon and May flies, ant lion, white ant, and similar predaceous insects, which undergo a complete or partial metamorphosis. The larvæ are six-legged, voracious and carnivorous, living in the water, on trees, or in the ground. Only the white ants and the wood ticks are injurious to vegetation; the others are rather beneficial to man by devouring aquatic and flying insects, plant lice, and similar pests. They are generally of elegant proportions, often prettily marked, and possess great powers of flight. Kirby separated the May or caddis flies (*phryganeæ*), and formed of them his order *trichoptera*. It is commonly believed that the ravages of white ants and their congeners are confined to tropical regions and to dead or decaying vegetation; but a few years ago a white ant, allied to the genus *termes*, was discovered at Salem, Mass., making its mines and galleries, destroying with its colonies the roots of grape vines in greenhouses, and making chambers even in the living wood.

NEUSATZ (Hung. *Újvidék*), a town of S. Hungary, in the county of Bács, on the left bank of the Danube, connected by a bridge with the opposite fortress of Peterwardein; pop. in 1870, 19,119. A United Greek bishop resides here, and the town contains an Armenian and several Greek, Roman Catholic, and Protestant churches, a synagogue, and a gymnasium. It was strongly fortified and prosperous until June 11, 1849, when it was stormed by the Austrians under Jellachich, and almost destroyed by the fire of the Hungarians from Peterwardein. It rapidly recovered, however. N. of the town is a line of Roman ramparts, erected by Trajan, which extends about 20 m. to the Theiss.

NEUSE, a river of North Carolina, rising in Person co., in the N. part of the state. It flows generally S. E. about 300 m., and empties into Pamlico sound through an estuary several miles wide in the lower part and about 50 m. long. It is navigable by steamboats eight months of the year for more than 100 m. The most important place on its banks is New Bern, at the mouth of its chief tributary, the Trent.

NEUSIEDLER LAKE (Hung. *Fertő*), after Balaton the largest lake of Hungary, situated near the Austrian frontier on the confines of the counties of Oedenburg and Wieselburg; length about 23 m., breadth 7 m., depth 9 to 13 ft. The reedy banks of the lake shelter innumerable water fowl. The E. side is marshy, adjoining the extensive marshes of Hansaság. In times of sudden inundations the overflowing waters are carried through an artificial canal into the river Rabnitz. The W. bank is surrounded by beautiful vine-clad hills, at the foot of which the town of Rust is situated. Other towns W. of the lake are Oedenburg and Eisenstadt. The lake dried up in 1865, as it had in 1693 and 1738, and the archduke Albrecht laid out a plantation there which he called Neu-Mexico. In September, 1870, the basin was again filled with water from the Raab and Rabnitz rivers, through the Hansaság marsh, the draining of which had been undertaken in 1865, and the farms and buildings were all submerged.

NEUSS, a fortified town of Rhenish Prussia, in the district of Düsseldorf, on the Erft, near its confluence with the Rhine, 21 m. N. W. of Cologne; pop. in 1871, 13,992. The Roman Catholic cathedral is a fine specimen of the architecture of the 13th century, and has been repeatedly restored. The town contains a Roman Catholic gymnasium and a Protestant church. It is a free port and the principal emporium of Rhenish Prussia in the corn trade, and produces more rape oil than any other town of Germany. There is also a large trade in coal, and the cattle fairs are largely attended. There are several manufactories of machinery and other articles. The Romans had a fort here (*Novesium*). Charles the Bold of Burgundy besieged Neuss in July, 1474, to assist Bishop Ruprecht of Cologne against his contumacious see. He withdrew after 11 months, having lost 10,000 men, on the appearance of the imperial army under Frederick III.

NEU-STRELITZ, a town of Germany, capital of Mecklenberg-Strelitz, on the E. side of Lake Zierke, 57 m. N. N. W. of Berlin; pop. in 1871, 8,470. The streets are broad, and converge into the market square. The palace is surrounded by fine pleasure grounds. There are two churches, a gymnasium, a library of 70,000 volumes, and collections of German antiquities and coins. About 2 m. S. of Neu-Strelitz is Alt-Strelitz, the former capital.

NEUSTRIA, the name of the western division of the Frankish empire under the Merovingians and Carolingians, from the partition of the provinces by the sons of Clovis in 511 to the beginning of the 10th century. In the earlier part of that period Neustria extended from the Meuse, which formed its boundary toward Austrasia, the eastern division, to the ocean and the Loire, which separated it from Aquitania. The principal towns were Soissons, Paris, Orleans, and Tours. In later times

it was restricted to the territories lying between the Seine and the Loire. The name disappeared when the maritime territory was ceded to the Normans (912), receiving the name of Normandy. (See FRANCE, vol. vii., p. 379.)

NEUTERS, a tribe of American Indians formerly living on both sides of the Niagara between the Hurons and Iroquois, to whom they were related, and remaining neutral in the war between those tribes, whence the name given them by the French. The Hurons called them Attiwandaronk. The Recollects in 1629, and subsequently the Jesuits, attempted missions among them without success. They informed the Recollects of the existence of oil springs in that part of the country. After the overthrow of the Hurons in 1649, the Neuters were attacked by the Iroquois, who killed many and incorporated the rest among the Five Nations of their league.

NEUTRA (Hung. *Nyitra*). **I.** A county of Hungary, bordering on Moravia and the counties of Trentschin, Turóc, Bars, Comorn, and Presburg; area, 2,219 sq. m.; pop. in 1870, 361,005, mostly Slovaks and Roman Catholics. It exceeds all other Hungarian counties in the production of sheep and cattle, and the commerce with Moravia is very active. It is watered by the Waag, Neutra, and March, and most of the soil is very fertile. Much wine is produced, of which the best is the red Neustädter. Woollen, cotton, and linen goods, and other articles, are manufactured. **II.** A town, capital of the county, on the river Neutra, 70 m. N. W. of Pesth; pop. in 1870, 10,683. It is the seat of a Roman Catholic bishop, and contains a cathedral, situated within a fortress on high ground, several convents, a theological seminary, and a gymnasium. In 1663 it was taken by the Turks, and in 1708 by the imperialists from the partisans of Rákóczy.

NEUTRALITY, in international law, the indifferent and impartial posture maintained by one nation with regard to others which are at war. "The neutral state," says Klüber, "is neither judge nor party." It may be the common friend of both belligerents, but may not favor either. The character of neutrality is generally impressed upon a nation only by the event of war, while in time of peace it may conclude offensive and defensive alliances, and in all respects arrange at its pleasure its relations with other states. Yet there may be what is called a permanent neutrality. Switzerland and Belgium by the existing arrangements in Europe, established in the case of the former by the declaration of the allied powers in 1815, and of the latter by the negotiations which established its independence in 1831, are to remain always neutral and independent of any complications which may in the future arise among the other European powers. These states, it is evident, cannot even in peace enter into any compacts or engagements which would be inconsistent with complete neutrality in case of war.—It is not a violation of neutral-

ity to furnish one only of two hostile parties with ammunition or other war supplies, provided this be done in accordance with previous treaty stipulations. Thus, by the treaty of 1788 with the United States, France secured the exclusive privilege of asylum in American ports for her privateers and their prizes. But in this case, as usually, such a qualification of neutrality, though clearly sanctioned by the law of nations, did not fail to provoke complaint and protest from the less favored power. It is not consistent with a neutral character to concede to one belligerent, to the exclusion of others, the liberty of raising land or sea forces within the neutral territory. This privilege the United States refuse to all belligerents alike, and the prohibition is declared by a permanent act of congress; and any attempt by a foreign power to obtain enlistments in this country would be regarded as an unfriendly act, and if aided or connived at by its diplomatic representative would be deemed a justification of a demand for his recall, as in the case of the British minister, Sir John Crampton, in 1855.—The perfect inviolability of its territory is the clearest if not the chief among the rights of a neutral state. A belligerent therefore cannot attack his enemy on neutral ground, and, in spite of a condemnation by a prize court of the captor, the neutral power will restore to its owner property captured within its jurisdiction. The neutral may refuse to all belligerents the privilege of passage over its domain, or must grant it, if at all, to all alike. It may forbid the entrance of war vessels and their prizes into its ports, although, in the absence of positive prohibition, the liberty to enter is implied. Our government has uniformly conceded this favor to the public ships of the hostile powers, without their prizes. To admit the entrance and sale of these in neutral ports is a favor which, in the opinion of eminent authorities, is hardly consistent with perfect neutrality, or with the dictates of true policy. As an illustration of modern practice in this respect, it may be added, that in the Crimean war Sweden and Norway and Denmark, adopting the same rules of neutrality, admitted into their ports the ships of war and of commerce of the belligerent parties, and accorded to them the facility of supplying themselves with all necessary stores and provisions not contraband of war, but forbade, except in cases of distress, the entrance, condemnation, or sale of any prize in any of the harbors of these kingdoms.—Whether the neutral can claim territorial immunity for its ships, whether in other words its flag shall protect the whole ship and cargo from the assertion of belligerent rights, has been a much vexed question in international law. The treaties concluded at Utrecht in 1713 had embodied the principle that the character of the vessel should determine that of its cargo; and though the same principle had been introduced into frequent conventions,

based upon these treaties, to which England had been a party, yet this power always refused to admit that express stipulations of this nature could change what it called the common law of nations in the premises. Except, therefore, when it was bound by special compacts, England has steadily maintained the integrity of the rule that enemy's goods on board a neutral ship are good prize of war. In 1781 the Baltic code of neutrality was first proclaimed by Catharine II. of Russia. One of its most prominent articles asserted the principle of the treaties of Utrecht, namely, that free ships should make free goods. The principal powers of Europe, excepting only England, acceded to the Russian rules of neutrality. The single influence of England against the code, however, was too great to be withstood, and it was abandoned in 1787. An attempt to revive it in 1801 was equally unsuccessful, and for the same reason. In its general jurisprudence the United States has, almost of necessity, adopted the English rule. But in its treaties, and particularly in those with American powers, it has generally inserted the more liberal principle that neutral ships shall make free goods. Since 1786 England had generally asserted her belligerent rights, until after the beginning of the Crimean war, by a common declaration with her ally France, promulgated in April, 1854, she announced that for the present she "waived her right of seizing enemy property laden on board neutral vessels, unless it were contraband of war." At the conclusion of the war England gave a more formal assent to the principle which she had so long opposed; for the declaration which was signed at the congress of Paris in 1856 by the plenipotentiaries of all the great powers, contained the provision that the neutral flag shall cover enemy goods, with the exception of those contraband of war, and it may be supposed has fixed the maxim in the law of nations. The rule usually coupled with that just referred to, though the two have really no connection, namely, that neutral goods, except contraband, are not liable to capture though laden in enemy ships, is also included in the declaration of the congress of Paris. It was formally rejected by France, but other nations have generally observed it.—Subject only to slight and reasonable restrictions, the neutral may carry on its commerce with the hostile powers. But plainly it must not furnish either with war supplies, nor indeed with any material which can directly contribute to the prosecution of hostilities. In the familiar phrase of the international law, its ships must not carry contraband. Further, they must neither break blockades, nor carry despatches for either party, nor in any other mode render direct assistance in the war. Finally, neutral ships must be always ready to prove themselves that which they profess to be, and must therefore be provided with papers sufficient to prove their nationality, and must submit to a reasonable exercise of the right

of visitation. It is not possible to define contraband specifically, that is, to declare what particular articles will be so regarded in time of war. There can be no doubt, however, respecting things which can be used only in war, or respecting materials which are peculiarly fitted by their nature for warlike uses. On the other hand, things which cannot be employed in war are, it is equally certain, not contraband. But it is difficult to determine the character of articles which are *ancipitis usus*, of a double or indifferent nature, and serviceable as well in peace as in war, such as money, provisions, ships and materials for ships, and naval stores. The decision will always be influenced by many considerations, as by the state and nature of the war, or by the highly probable destination of goods to a military use. Thus provisions, which *prima facie* are not contraband, will certainly be declared so when they are destined to a besieged town or blockaded port. The character of the port to which goods are bound may also be of consequence: whether, that is to say, it be a port of merely naval equipment, or one of general commerce. The changes which science has made in the needs and modes of warfare are also to be regarded, as well as the consideration whether the goods alleged to be contraband are or are not the produce of the country which exports them. Carrying official communications for a belligerent upon the public affairs of his state is a flagrant violation of neutrality. But to carry despatches from the enemy to his ambassador or consul in a neutral country is, generally speaking, no ground for condemnation, for the legal presumption is that the communication has reference to the commercial relations of the belligerent and the neutral. In the case of the Trent, in 1861, a naval officer of the United States asserted the right to seize on a neutral ship the ambassadors of the enemy proceeding to the courts to which they were accredited; but the right was denied by Great Britain, and the government disavowed the act. It seems to be the better opinion that the contraband character of the ship or goods terminates with that passage in which the forbidden trade is intended or done, and does not affect the whole voyage. The owner of the contraband loses all, even the innocent goods which he has laden in the ship. Other shippers forfeit nothing. This doctrine of contraband implies rather necessarily the belligerent's right to search neutral ships for such articles as may contribute to the comfort and strength of the enemy. The law of nations has been in this respect that in time of war search may be made for contraband and for enemy's goods. The late modification of the former practice, by which, as we have already seen, the goods of the enemy in neutral ships are now exempted from seizure, must tend, it would seem, to reduce the application of the law of search to the case of contraband alone. Some powers have de-

feated or hoped to defeat the right of search for contraband goods by forbidding their subjects to carry them; and sometimes treaties have provided that, in the case of ships under convoy, the declaration of the commander should suffice to exempt the ships in his charge from search.—A further restriction in force on the commerce of the neutral consists in his incapacity to trade to blockaded ports. To constitute a violation of blockade there must be first an actual blockade by a force sufficient to maintain the same; then there must have been proper notification of it; with these must concur some act of violation, either by going in or coming out with a cargo laden after the commencement of the blockade or an attempt so to do. Sir William Scott once held that a temporary absence of the blockading squadron, from being driven off by a storm or other accident, did not suspend the operation of the blockade. The French publicists controvert this doctrine, as unwarranted by the general principles of international law. But the law as Sir William Scott declared it is probably at present the law of England. The English and French declarations of 1854, however, speak of "effective blockades, which may be established with adequate forces." Some exception has been taken in the United States to the rule which forbids the departure of a vessel laden after the blockade was known. In a communication to Mr. Buchanan, American minister in London, in 1854, Mr. Marcy urges that, having visited the port in the common freedom of trade, the neutral vessel ought to be allowed to depart with a cargo, without regard to the time when it was received on board. This relaxation of the law of blockade will be hardly yet admitted in the general practice of nations; but, especially in our treaties with the Central and South American republics, it has assumed the form of familiar stipulation.—The principles of the international law of neutrality assume a peculiar significance in the law of marine insurance. In marine policies the ownership of the property is usually the subject of express warranty, and underwriters are thus informed of its liability to or freedom from war risks. The neutrality itself may be sometimes expressly warranted. In these cases the warranty is construed to mean, first, that the ship or cargo is actually owned by citizens of a country not at war when the risk begins, and secondly, that with the property there shall go all those usual documents and precautions which prove the neutrality and protect it from belligerent risks. The bill of sale of the ship, the sea letter or customary certificate of nationality, the register of the vessel, the charter party, shipping papers, the log book, and in general all the documents which usually state the national character, and especially the flag, must conform to the warranted neutrality of the ship. The law holds, too, that if a vessel exhibit only false papers when she is captured, there is a breach of the warranty, though she

have on board the proper papers of her nation, and have the right to carry false papers, because she must not only have the proper documents, but must use them at a proper time and in a proper way. Yet it seems that simulated or false papers may not only be carried when leave is expressly given, but when a usage exists to carry them, which is or should be known to the insurer. The warranty of the neutrality of a ship is broken if a belligerent own any part of it. In regard to goods the rule is different, and the warranty is held to extend only to the interest of the insured, and is not broken by the fact that a part of the cargo not insured is not neutral. But when the interest insured covers the whole cargo, the law will regard the real ownership; and therefore property held by a neutral by a legal title indeed, but for the benefit of and in trust for a belligerent, is belligerent property. If neutral goods are shipped in time of peace to a consignee who has not ordered them, so that the property would not vest in him till the goods were received, in case of capture they are considered as the property of the consignor. But if they are shipped by a neutral after the war begins, and under a contract made during peace but in contemplation of war, and to be at the risk of the sendee until delivery, they are put on the same footing as if the contract were made during war. If a subject of a belligerent power ship goods to a neutral which have not been ordered by him, so that the belligerent retains control over them, they are considered as his property. The mere right of the belligerent seller to stop goods *in transitu* on the insolvency of the vendee is not such an interest as would make the goods belligerent. The warranty of neutrality requires such trade, conduct, and course of transaction as shall be in conformity and adaptation to this warranty. Therefore, if the neutral interests or property are indistinguishably mixed up with belligerent interests or property, they become themselves liable to all the incidents and effects of a belligerent character. So resistance of a search when rightfully demanded, an attempt at rescue, seeking belligerent protection or receiving it, are all breaches of the warranty of neutrality, because they are belligerent in character. It is a sufficient compliance with the warranty, that a vessel is neutral according to the law of nations; and for a condemnation for breach of ordinances which are contrary to that law, the underwriters are still liable.

NEUVILLE, Alphonse de. See supplement.

NEUVILLE, Hyde de. See HYDE DE NEUVILLE.

NEUWIED, a town of Rhenish Prussia, on the right bank of the Rhine, 6 m. N. W. of Coblenz; pop. in 1872, 8,664, chiefly Protestants. There are about 400 Moravians, whose extensive establishments have given to Neuwied its chief celebrity. It dates from the 17th century, and by the liberality of its princes industrious persons of different religious creeds were attracted to the place, and established

manufactures of wool and cotton which have given to it its present prosperity. The palace possesses a museum of natural history, and a collection of Roman antiquities, chiefly from the buried Roman town of Victoria discovered in this vicinity in 1791.—The mediatized princes of Neuwied (or Wied, also Wied-Neuwied) are of very ancient origin, and among them have been several eminent men. Prince HERMANN (1814-'64) was distinguished as a soldier and as the anonymous author of philosophical works. His son, Prince WILLIAM (born in 1845), the present head of the house, is a brother of the princess Elizabeth, who became in 1869 the wife of Charles I. of Roumania, and he married in 1871 the Dutch princess Mary. An uncle of Prince Hermann was the celebrated traveller Prince MAXIMILIAN (1782-1867). He served in the Prussian army, but after having risen to the rank of major general left the service, and in 1815-'17 travelled in the interior of Brazil, exploring the dense forests of Bahia and Espirito Santo. He devoted special attention to zoölogy and ethnography, and was the first European to give any definite information respecting the Botocudos. In 1832-'4 he travelled in the United States, visiting its remote western regions. He published *Reise nach Brasilien* (2 vols., Frankfurt, 1819-'20), *Abbildungen zur Naturgeschichte Brasiliens* (Weimar, 1823-'31), *Beiträge zur Naturgeschichte Brasiliens* (4 vols., 1824-'33), and *Reise durch Nordamerika*, with 81 plates (2 vols., Coblenz, 1838-'43; English version, London, 1843), which is valued for its magnificent illustrations and its contributions to American ethnography. His zoölogical collection, embracing some of the rarest specimens of the South America fauna, is now in the American museum of natural history, New York. A genus of palms has been named in his honor *Maximiliana*.

NEVA, a river of Russia, flowing from the S. W. extremity of Lake Ladoga, first S. W., then N. W., and ultimately through the city of St. Petersburg, discharging by many mouths into the gulf of Finland. Its entire course is not more than 40 m., but it is very wide, has an average depth of two to three fathoms, and is of great commercial importance. It is liable, particularly at the breaking up of the ice in April, to sudden inundations, often most disastrous to St. Petersburg, which is built on the islands formed by its branches.

NEVADA, one of the western states of the American Union, the 23d admitted under the constitution, situated between lat. 35° and 42° N., and lon. 114° and 120° W.; extreme length N. and S. in the east, 485 m., and on the W. boundary, 210 m.; greatest breadth, on the 39th parallel, 320 m., N. of which it contracts to about 310 m., and S. of which it contracts to a point; area (greater than that of any other state except Texas and California), 104,125 sq. m. It is bounded N. by Oregon and Idaho, E. by Utah and Arizona (from the latter of which

THE LIBRARY
OF THE
UNIVERSITY OF ILLINOIS

it is partly separated by the Colorado river), and S. W. and W. by California. The state is divided into 14 counties, viz.: Churchill, Douglas, Elko, Esmeralda, Eureka, Humboldt, Lander, Lincoln, Lyon, Nye, Ormsby, Storey, Washoe, and White Pine. The principal cities and towns are Virginia (pop. in 1870, 7,048), Gold Hill (4,311), Hamilton (3,913), Carson City (the capital of the state 3,042), Treasure (1,920), Austin (1,324), Elko (1,160), Pioche City (1,144), Reno (1,035), Dayton (918), and Silver City (879). The population, exclusive of tribal Indians, in 1860 was 6,857; in 1870, 42,491, of whom 38,959 were whites, 357 colored, 3,152 Chinese, and 23 Indians; 32,379 were males and 10,112 females; 23,690 natives and 18,801 foreigners. There were 9,880 families, with an average of 4·3 persons to each, and 12,990 dwellings, with an average of 3·27 to each. The number of male citizens of the United States 21 years old and upward residing in the state was 18,652. Nevada has fewer inhab-

was between 4,000 and 5,000, viz.: Pah-Utes, 800; Pi-Utes in the S. part of the state, 1,031; Pi-Utes (1,000), living partly in W. Nevada and partly in N. E. California; Western Shoshones (1,945) and Goshop Utes (460), living partly in central and E. Nevada, and partly in Oregon, Idaho, and Utah. The Pah-Utes have two reservations of 320,000 acres each, including Walker lake and Pyramid lake respectively. The southern band of Pi-Utes belongs on a reservation of 3,900 sq. m. in the S. E. part of the state, but only about 500 have been removed to it. The tribes of Nevada are not hostile, and many of their members are engaged in agriculture.—With the exception of the S. E. corner, which belongs to the basin of the Colorado river, and a small portion in the N. E. drained by the Owyhee and other tributaries of the Snake, Nevada forms part of the elevated region lying between the Wahsatch and Sierra Nevada mountains, and known as the Great Basin. The general surface is a table land, with an altitude of 4,500 ft. above the sea, traversed with great uniformity by nearly parallel ranges of mountains rising from 1,000 to 8,000 ft. higher. These ranges for the most part have a N. and S. direction, and are separated by valleys from 5 to 20 m. wide, the bases of the mountains having also about the same width. The mountains are frequently intersected by ravines, which form easy passes, and in some places are broken into confused and detached masses. The valleys sometimes extend more than 100 m., uninterrupted except by an occasional butte or projecting spur, and frequently, where the mountains disappear or contract, unite with other valleys, or expand into broad plains or basins, some of which are unobstructed, while others are dotted with buttes or covered with groups of rugged hills. The Sierra Nevada mountains, which form a portion of the W. boundary, reach an elevation of from 7,000 to 13,000 ft. above the sea.—The rivers of Nevada are small and unnavigable, and with the exception of the Owyhee and other streams that flow N. into Oregon and Idaho, and join the Snake, a branch of the Columbia, and the Rio Virgen and other small tributaries of the Colorado in the S. E., have no outlet to the ocean. The Colorado is navigable along the S. E. border to Callville. Some of the streams terminate in beautiful lakes; others disappear in "sinks" or sloughs. Many of them in their course sink in the porous soil, and reappear a few miles further on. There are many small mountain streams that lose themselves soon after reaching the plains. The Humboldt, the longest river, rises in the N. E. corner of the state, flows generally W. for upward of 200 m., when it receives the Little Humboldt from the north, bends S. W., and after a further course of nearly 100 m. terminates in Humboldt lake or sink. Walker river is formed in the S. W. part of the state by the junction of the E. and W. forks, which rise in the Sierra Nevada in California, and flows first N. E. and then S.

State Seal of Nevada.

itants than any other state. Of the native population, 3,356 were born in the state, 3,265 in New York, 2,390 in California, 1,858 in Ohio, 1,488 in Pennsylvania, 1,144 in Illinois, 1,083 in Maine, 1,053 in Missouri, 997 in Massachusetts, and 958 in Utah. Of the foreigners, 5,035 were natives of Ireland, 2,549 of England, 2,365 of British America, and 2,181 of Germany. There were 727 persons 10 years old and upward unable to read, and 872, including 198 Chinese, unable to write. Of the total number of persons 10 years old and upward returned as engaged in all occupations (26,911), 2,070 were employed in agriculture, including 555 laborers and 1,242 farmers and planters; in professional and personal services, 7,431, including 35 clergymen, 3,939 laborers, 166 lawyers, 110 physicians and surgeons, and 61 teachers; in trade and transportation, 3,621; and in manufactures and mechanical and mining industries, 13,789, of whom 8,241 were miners. The number of tribal Indians in Nevada in 1874, according to the report of the United States commissioner of Indian affairs,

E., and terminates in Walker lake in Esmeralda co., after a course of 45 m. The Truckee river flows from Lake Tahoe on the California border, W. of Carson City, in an irregular N. E. course of about 60 m., and empties into Pyramid lake. Carson river rises in the Sierra Nevada S. of Lake Tahoe, and flows N. E. to the Carson lakes in Churchill co. Reese river, in the central portion of the state, flows N. toward the Humboldt, but usually sinks before reaching it. Quin's river and King's river are in the northwest. In the south is the Amargosa river, which disappears in Death valley, California. About a third of Lake Tahoe is in Nevada. It has a depth of 1,500 ft., is 21 m. long by 10 m. wide, and, though more than 6,000 ft. above the sea, never freezes, the temperature of the water varying little from 57° throughout the year. Pyramid lake, in the E. part of Washoe co., 33 m. long and 14 m. wide, and Walker lake, about 30 m. long and 6 or 7 m. wide, have considerable depth, and as well as Lake Tahoe contain pure water and abound in trout and other fish. The water of the rivers, particularly of the mountain streams, is generally fresh and pure, and well stocked with fish. In some of the rivers, however, as the Humboldt, particularly in low stages of water, and in most of the smaller and shallower lakes, it is brackish and alkaline. Lower Carson lake, 12 m. in diameter, and Humboldt lake, somewhat smaller, are shallow, being in fact mere sinks, and are connected with each other at high stages of water by small streams or "sloughs." Other lakes or sinks are Ruby, Franklin, and Snow Water, in the E. part of the state, and Winnemucca lake, E. of Pyramid, which occasionally discharges into it its surplus waters. Many of the plains and valleys, being nearly level or slightly basin-shaped, and consisting of a stiff clay nearly impervious to water, are readily converted in the wet season into shallow lakes, rarely more than a foot or two deep, which derive the name of "mud lakes" from their generally miry and impassable condition. Some of them exist only for a few days, others last until the dry season comes on, and a few continue throughout the year. When dry, their beds become very hard, and are often covered with an incrustation of alkaline matter, in which condition they are known as alkaline flats. The most extensive mud lakes occur in the N. W., central, and S. portions of the state, where some of them cover more than 100 sq. m.—Both cold and hot springs abound in many parts, some being in a state of ebullition, others quiet; some pellucid and pure, others impregnated with a great variety of mineral substances. In some places they occur singly, and in others in groups. They range in temperature from 50° to 204°, the latter being about the boiling point of water in this region; in diameter, from 1 to 100 ft.; and in depth, from 3 or 4 to 150 ft. They are generally circular in form. The mineral and warm springs are commonly situated on mounds formed of

the silicious or calcareous particles brought up by their waters, sometimes covering several acres and 50 or 60 ft. high. Hot and cold springs are often found in close proximity to each other. The most common mineral substances found in the waters are chlorides of sodium and magnesium, with soda in various forms, and a small percentage of lime, sulphur, silica, and iron. Some of these springs possess curative properties. The most remarkable group of warm springs in the state is that known as the Steamboat springs in Washoe co., about 16 m. N. of Carson City and 4 m. E. of the Sierra Nevada. They occupy a rocky mound about $\frac{1}{2}$ m. long and $\frac{1}{4}$ m. wide, rising 50 or 60 ft. above the valley. The mound is rent longitudinally by a number of irregular fissures from six inches to a foot in width, through which at intervals of a few minutes volumes of hot water gurgle up, and after hissing and foaming for a minute or two subside. From some of the fissures small jets of steam constantly escape, accompanied by gas. Besides the fissures there are pools filled with hot water, one of which, occupying a basin 3 ft. in diameter and 1 ft. high, rises and falls every six minutes. The temperature of these springs varies greatly, that of the hottest being 204°. The air here smells of sulphur, and the ground in the vicinity is impregnated in places with that mineral. The springs emit a sound like that of a boiling caldron, and when first discovered are said to have given forth a puffing noise like that of a steamboat, whence their name. Some of the cold springs, particularly in the E. and central parts of the state, are scarcely less remarkable for their size, depth, and volume of water discharged. The salt deposits of Nevada are extensive and important. The largest supply at present is obtained from the Sand Springs salt marsh, E. of the Carson sink in Churchill co., which contains a bed of crystallized salt of unknown thickness below several layers of clay. It is obtained only from the surface, which is damp and marshy, and in some places covered with a few inches of water, and is coated with a crystallized incrustation of salt two or three inches thick. When removed it immediately begins to reform, and a fresh supply may be gathered about once a month. About 40 m. N. of the Sand Springs marsh, in the same county, is a similar deposit, from which a considerable quantity is obtained. It consists of an incrustation of salt an inch or two thick, overlying a stratum of blue clay 18 in. thick, filled with cubical crystals of salt, and resting upon an unknown depth of pure salt. The most extensive salt field of the state is in Silver Peak district, Esmeralda co., covering an area of 40 or 50 sq. m., much of which is coated with a thick incrustation of pure salt underlaid by seams of clay and a crystallized mass of salt of unknown thickness. In Smoky valley, Nye co., 2 m. from the line of Lander co. and 32 m. from Austin, is a salt marsh, upon which an incrustation of salt

forms in spring, which is gathered. Salt valley, 30 m. E. of Humboldt lake, is remarkable for its immense salt bed. In Lincoln co., in the S. E. part of the state, W. of the Rio Virgen, are the "salt bluffs," 500 ft. above the level of the valley, consisting of a mass of pure rock salt, nearly 2 m. long and $1\frac{1}{2}$ m. wide, of unknown depth, covered with a coating of sand and earth from a foot to several feet thick. The waters of the Eagle salt marsh, in Churchill co., 3 m. from Hot Springs on the Central Pacific railroad, contain 30 per cent. of salt, which is obtained by evaporation. There is also a salt marsh in Eureka co., 43 m. N. of the town of that name, where salt is made by evaporation. Borax is also an important product of the state. It is manufactured in Churchill co. near Hot Springs, and E. of the sink of the Carson, from boracic acid and the borates of lime and soda, which occur in the alkali flats. The richest and most extensive deposits of the salts of borax (containing 31 per cent. of that substance) are found near Columbus, in Esmeralda co., and large quantities are here manufactured. The borates of lime and soda occur between two layers of salt, the lower one of which is itself overlaid by a bed of sulphate of soda (Glauber's salt). Soda is obtained from a small lake 25 m. from Wadsworth, on the Central Pacific railroad, in the central part of the state, forming on the shore in a nearly pure state as fast as removed. —The general geological character of Nevada is volcanic. The mountain ranges are composed, first, of crumpled and uplifted strata, from the late Jurassic down to the azoic period; secondly, of ancient eruptive rocks, which accompany the Jurassic upheaval; and thirdly, of modern eruptive rocks belonging to the volcanic family, and ranging in date probably from as early as the late miocene up to the glacial period. The valleys are filled with quaternary detritus, the result of erosion from the early cretaceous period down to the present time. Syenite, granite, porphyry, slate, and quartzite prevail in some of the mountain ranges, while many of them are of limestone, mingled with calcareous spar; this either rests upon or alternates with hard and compact grits and quartzite. In many of the cañons are found boulders of serpentine, conglomerate, talcose slate, fine gray granite, coarse red, crystalline white, and metamorphic sandstone, gypsum, pebbles of alabaster, and various kinds of limestone. Marble of different textures is found in various localities. The volcanic action is indicated by the presence of lava, obsidian, scoria, and sulphur. In the mountains of the Colorado basin limestone predominates, besides which are found granite, syenite, serpentine, arenaceous and chloritic slates, all scored and marked by dikes and overflows of trachytic lavas and basaltic trap rock. Where granite and gneiss (which are the prevailing rock formations of the Sierra Nevada) occur here, they are for the most part

hidden by porphyries, greenstone, amygdaloid, basalt, obsidian, and other rocks of igneous origin. Traces of coal of different varieties, but generally of inferior quality, have been found in various localities, but it has not been successfully mined, and is not known to exist in valuable quantities. Seams of coal of superior quality have recently been discovered in the Pancake mountains in White Pine co., 15 m. from Hamilton, but to what extent they can be made available is yet undetermined. Kaolin and other clays, useful in the manufacture of pottery and fire brick, mineral pigments, nitre, and alum are found. Copper occurs in Churchill co., E. of the lower Carson sink; in Battle Mountain and Bolivia districts, Humboldt co., where several mines are in operation; and between the forks of Walker river. Rich lead and copper ores exist in Washoe co., and copper and iron are found in Robinson district; White Pine co., 45 m. E. of Hamilton. Veins of antimony are worked in Battle Mountain district. These metals, which are also found in other parts of the state, and cinabar, manganese, plumbago, magnesia, platinum, zinc, tin, nickel, cobalt, and arsenic, generally occur in connection with the precious metals. Gold and silver are commonly found associated with each other, gold predominating in the Antelope district, Churchill co.; in Tuscarora district, on the head waters of the Owyhee river; in Gold Mountain district, Esmeralda co.; in Sacramento district, and in some of the mines of Sierra district, Humboldt co.; and in some other places. But the great wealth of Nevada is in its silver mines, which exist in nearly every section. The richest deposit of silver in the state, if not in the world, is the Comstock lode, on the E. side of Mt. Davidson, in Storey co., and partly under the towns of Virginia and Gold Hill. Its ores contain about one third in value of gold and two thirds of silver. The lode has been traced on the surface 27,000 ft., and has been actually explored for 19,000 ft., within which space the principal mines are situated. It has been opened to a depth of 2,000 ft. New deposits were discovered toward the close of 1874, which are believed to be of incalculable value. A tunnel, known as the Sutro tunnel, is in progress, designed to drain the mines and otherwise facilitate operations on the lode. It commences at a point $1\frac{1}{2}$ m. from Carson river and $3\frac{1}{2}$ m. below Dayton, and runs N. W. to the Savage mine, a distance of 20,178 ft., where its depth will be 1,922 ft. At the close of 1874 it had reached a distance of 8,250 ft., and was progressing at the rate of 7 ft. a day. Next to those of the Comstock lode, the most productive silver mines are in the region near Eureka, in the E. central portion of the state, and in the Ely district, near Pioche, Lincoln co., in the S. E. The White Pine region in the E. part of the state, which after the discovery of the mines in 1868 was the scene of great excitement, now yields comparatively small

returns. The bullion product of the state since the opening of the mines, according to R. W. Raymond, United States commissioner of mining statistics, has been as follows:

YEARS.	ENTIRE PRODUCT OF THE STATE.			Separate product of the Comstock lode.
	Gold.	Silver.	Total.	
1861 ..	\$600,000	\$1,400,000	\$2,000,000	\$1,500,000
1862 ..	2,500,000	4,500,000	7,000,000	6,000,000
1863 ..	4,000,000	8,500,000	12,500,000	12,000,000
1864 ..	5,000,000	11,000,000	16,000,000	14,500,000
1865 ..	4,750,000	11,250,000	16,000,000	14,500,000
1866 ..	4,000,000	9,000,000	13,000,000	12,000,000
1867 ..	4,500,000	11,500,000	16,000,000	13,600,000
1868 ..	2,800,000	10,500,000	13,300,000	8,500,000
1869 ..	2,500,000	11,500,000	14,000,000	7,550,000
1870 ..	2,800,000	13,200,000	16,000,000	8,500,000
1871 ..	3,750,000	18,700,000	22,450,000	11,350,000
1872 ..	6,000,000	19,550,000	25,550,000	14,000,000
1873 ..	10,000,000	25,250,000	35,250,000	22,000,000
1874 ..	10,000,000	25,500,000	35,500,000	23,000,000
Aggregate.	\$63,230,000	\$181,350,000	\$244,580,000	\$169,000,000

The value of the bullion product of Nevada since 1871 has exceeded that of California. The United States census of 1870 (admitted to be incomplete) returns 139 mines, having 44 steam engines of 2,780 horse power and 2 water wheels of 50 horse power; hands employed, 2,866 (809 above and 2,057 below ground); capital invested, \$32,253,400; wages paid during the year, \$2,900,872; value of materials used, \$1,636,865; of products, \$11,166,452. Of the mines, 91 were quartz mines of silver, 46 quartz mines of gold and silver, 1 copper, and 1 lead. The number of quartz-crushing mills in 1872, according to the report of the state mineralogist, was 162; number of smelting furnaces, 16; number of stamps, 1,904; daily capacity in tons, 5,183. These numbers include those idle as well as those in operation. (See SILVER.) The amount of bullion from Nevada deposited at the United States mints and assay offices to June 30, 1874, was \$17,044,166 42, of which \$13,492,414 79 was silver and \$3,551,751 63 gold. A mint was established at Carson City in 1870, at which the deposits of gold from all sources to Dec. 31, 1874, amounted to \$14,093,487 86; of silver, to \$14,109,017 19; total, \$28,202,505 05. —The climate is in general comparatively mild, the summers not warmer than E. of the Rocky mountains, and the winters less severe than in New England, little snow falling except on the mountains. In the north and interior the average summer temperature at noon is 90°, falling to 70° at night. In the severest weather in winter the thermometer ranges from 0° to —15° or —20°. In the southeast the winters are milder, frosts being rare in the valleys, and the summers hotter; the thermometer in May and June ranges from 95° to 115°. Little rain falls, artificial irrigation being necessary to agriculture, and thunder and lightning, though more frequent than in California, are rare. In the north and west the wet season lasts from January to May, when there are slight rain-falls, while occasional showers occur in the

south and east during the summer months. Cloud bursts, which precipitate large quantities of water, and often do much damage, are not infrequent; and sand storms and sand clouds or pillars, the latter formed after the manner of water spouts, are common on the plains, where also mirage is of frequent occurrence. The air is generally pure and invigorating.—The general appearance of Nevada is arid and barren. The E. slopes of the Sierra Nevada within the state are heavily timbered with pine, spruce, and fir. These forests constitute the only lumber region of the state, and are fast disappearing. The other mountain ranges are bare or thinly wooded with dwarf trees, principally cedar and *piñon* or nut pine, with mountain mahogany, fir, and juniper in some localities. The White Pine mountains, in the county of the same name in the E. part of the state, contain some good-sized white pine and white fir, and the yellow pine on the E. slope of the Spring mountains in the Colorado basin attains a considerable size. The open plains and narrow valleys are destitute of wood, except where traversed by considerable streams, along which occur scattered cottonwoods, copses of willows, birch, wild cherry, &c., mostly of small size and little value. With these are often found rose, currant, gooseberry, and other bushes, and varieties of wild vines. The plains generally produce only sand grass and sage (*artemisia*), while the watered valleys contain meadow land, and most of the mountain ranges are more or less clothed with bunch grass. But in some sections valleys, plains, and mountains are equally destitute of wood, and but scantily supplied with grass and water, the latter where it occurs being often so impregnated with mineral substances as to be unwholesome, or so warm as to be unfit for immediate use. Some of the more extended plains are so barren as to receive the popular designation of "deserts," among which may be mentioned those adjacent to the sinks of the Humboldt and Carson, the vicinity of the mud lakes in the northwest, and the region stretching from the Great Salt valley of Churchill co. through the centre of the state, and spreading out into the sandy wastes that surround Death valley in California. Most of the Colorado basin is a sandy desert yielding only sage brush, greasewood, and cacti. The mezquite bush is also found in this part of the state. Large portions of Nevada are well adapted to grazing, stock in most parts of the state requiring neither prepared food nor shelter in winter. The bunch grass of the mountains furnishes food in summer, and in winter the herds descend to the plains and fatten on the sand grass and white sage. The sand grass grows in bunches to the height of a foot, and bears an abundance of small black seeds that are very nutritious; the white sage is eagerly sought for after it has been touched by the frost. Much of the most barren land of the state possesses the elements of fertility, and with irrigation would be productive. The

general character of the soil and contour of the surface induce the belief that artesian wells may be successfully employed for this purpose. At present agriculture is carried on only in the fertile bottoms of the principal rivers, and at points where the mountain streams afford the means of irrigation. The principal agricultural tracts are the valleys of the Truckee, Humboldt (though the soil here is somewhat alkaline), Quin's, King's (25 m. N. W. of the last), Reese, Walker, Carson, and Owyhee rivers; Paradise valley, watered by the Little Humboldt; and Pahrnegat valley, in the S. E. part of the state. Some of the valleys not intersected by rivers are susceptible of cultivation. Here the mountain streams sink upon reaching the valleys, and make their way underground toward the centre, where, meeting with obstructions or gathering in natural basins, they saturate the earth and render it productive. Around some of the lakes or sinks and along some of the streams occur patches of "tulé land," or ground overflowed at high water and covered with a large species of bulrush. When drained these tracts form excellent meadows and may be cultivated. The chief crops are wheat, barley, oats, hay, potatoes, and other vegetables. In most parts of the state the nights are too cool for Indian corn. In some places apple, pear, peach, and plum trees, and the grape vine have been set out, and have borne well. Forest and shade trees have also been planted at a few points. In the valley of the Muddy, a tributary of the Rio Virgen, and at other points in the Colorado basin, the Mormons a few years since had settlements, where they raised cotton, sorghum, tobacco, melons, squashes, beans, Indian corn and the smaller grains, oranges, lemons, peaches, grapes, apples, pears, apricots, figs, pomegranates, olives, &c. Two crops a year may be raised here, wheat, barley, and oats being harvested in June, after which corn, beans, and garden vegetables are planted. The principal wild animals are the hare, coyote, and wolf. The beaver, otter, marten, fox, fisher, and other fur-bearing animals are now rarely found. The sage hen is common, and geese, ducks, cranes, and pelicans are numerous around the lakes and sinks at certain seasons of the year.—The number of acres of improved land in farms in 1870 was 92,644; number of farms, 1,036, of which 116 contained less than 10 acres each, 138 from 10 to 20, 190 from 20 to 50, 150 from 50 to 100, 242 from 100 to 500, 197 from 500 to 1,000, and 3 more than 1,000; cash value of farms, \$1,485,505; of farming implements and machinery, \$163,718; amount of wages paid during the year, including the value of board, \$438,350; estimated value of all farm productions, including betterments and additions to stock, \$1,659,718; value of orchard products, \$900; of produce of market gardens, \$31,235; of forest products, \$36,700; of home manufactures, \$2,329; of animals slaughtered or sold for slaughter, \$104,471; of live stock, \$1,445,449.

The productions were 147,987 bushels of spring wheat, 80,879 of winter wheat, 310 of rye, 9,660 of Indian corn, 55,916 of oats, 295,452 of barley, 985 of buckwheat, 414 of peas and beans, 129,249 of Irish potatoes, 7 of clover seed, 64 of grass seed, 25 lbs. of tobacco, 27,029 of wool, 110,880 of butter, 711 gallons of wine, 63,850 of milk sold, 3,651 of sorghum molasses, 106 bales of cotton, and 33,855 tons of hay. The live stock consisted of 7,520 horses, 990 mules and asses, 6,174 milch cows, 2,443 working oxen, 22,899 other cattle, 11,018 sheep, and 3,295 swine. There were also 6,880 horses and 9,453 cattle not on farms. The number of manufacturing establishments was 330, having 120 steam engines of 6,007 horse power and 34 water wheels of 2,538 horse power; number of hands employed, 2,859; capital invested, \$5,127,790; wages paid during the year, \$2,498,473; value of materials used, \$10,315,984; of products, \$15,870,539. The principal items are shown in the following table:

INDUSTRIES.	Number of establishments.	Capital invested.	Value of products.
Blacksmithing.....	33	\$31,000	\$141,800
Boots and shoes.....	22	17,300	76,770
Carpentering and building	24	13,000	96,400
Carriages and wagons.....	3	21,000	60,000
Clothing.....	7	9,600	42,600
Confectionery.....	3	9,000	40,500
Flouring and grist mill products	7	47,200	97,920
Furniture.....	8	23,900	39,600
Gold and silver, reduced and refined.....	1	50,000	260,000
Iron castings.....	5	101,000	641,250
Lead pigs.....	9	438,000	894,600
Liquors, malt.....	17	83,300	184,980
Lumber, sawed.....	18	198,500	432,500
Machinery.....	6	57,000	841,500
Mineral and soda waters.....	3	11,000	36,000
Quartz, milled.....	93	3,869,500	12,119,719
Saddlery and harness.....	9	24,400	60,200
Sash, doors, and blinds.....	2	21,000	55,000
Tin, copper, and sheet-iron ware	12	43,500	99,300
Wheelwrighting.....	12	11,550	70,500

The number of steam engines employed in the quartz mills was 84, with 5,006 horse power; water wheels, 22, with 2,168 horse power; hands employed, 1,637; wages paid during the year, \$1,693,135; value of materials used, \$8,527,843. There are 527 m. of railroad in the state, viz.: Central Pacific, which crosses it from E. to W., connecting with San Francisco and the Union Pacific railroad, 454 m.; Virginia and Truckee, from Reno on the Central Pacific *via* Carson City to Virginia, 52 m., with a branch of 1 m.; and the Pioche and Bullionville, between those two points in Lincoln co., 20 m. The Eureka and Palisade railroad, from Palisade on the Central Pacific to Eureka, 82 m., is to be completed in the summer of 1875. There is one bank of deposit, incorporated under state law, with a capital of \$100,000.—The executive power is vested in a governor (salary \$6,000), lieutenant governor (*ex officio* adjutant general and state librarian), secretary of state, treasurer, comptroller, surveyor general and land register, and attorney

general (salary \$3,600 each), elected for four years. A superintendent of public instruction (salary \$2,000) and a state mineralogist (\$3,600) are elected for the same term. The legislative authority is vested in a senate of 25 and an assembly of 50 members, chosen by districts, senators for four years (half retiring biennially) and assemblymen for two years. Members of the legislature receive \$8 a day while in attendance and 40 cents a mile in going to and returning from the seat of government. Regular sessions cannot exceed 60 days, and are held biennially, commencing on the first Monday in January of odd years. The judicial power is vested in a supreme court, district courts, and justices of the peace. The supreme court consists of a chief and two associate justices (salary \$7,000 each), elected for six years, one retiring every two years. The state is divided into nine judicial districts, in each of which a district judge is elected for four years. Justices of the peace are elected in the various cities and townships for two years. In civil cases that require a jury three fourths may render a verdict. The right of suffrage is conferred by the constitution upon all white male citizens of the United States of sound mind and not convicts, who have attained the age of 21 years, and have actually resided in the state six months and in the district or county 30 days next preceding the election. Under the federal constitution colored citizens have the right to vote. General elections occur on the Tuesday next after the first Monday of November of even years. Amendments to the constitution must be proposed by two successive legislatures and adopted by the people. A convention to revise the constitution may be called by a two-thirds vote of each house of the legislature, ratified by a vote of the people. The circulation of bank notes or paper of any kind as money, except federal currency and notes of banks authorized by congress, is prohibited. In the absence of special agreement the rate of interest is 10 per cent., but any rate may be stipulated for in writing. Nevada is entitled to two senators and one representative in congress, and therefore has three votes in the electoral college.—The assessed value of real estate in 1870, according to the United States census, was \$14,594,722; of personal property, \$11,146,251; total assessed value, \$25,740,973; total true value of property, \$31,134,012. The total taxation was \$820,308, of which \$298,411 was state, \$498,062 county, and \$23,835 town, city, &c.; total public debt, \$1,986,093, of which \$642,894 was state, \$987,423 county, and \$355,776 town, city, &c. The state debt includes bonds to the amount of \$58,000 held by the school fund; the amount of the interest and sinking fund was \$86,121. The assessed value of property for 1874, according to the report of the comptroller, was: real estate, \$14,125,578 01; personal estate, \$12,504,701 21; total, \$26,630,279 22; state tax thereon

(\$1 25 on \$100), \$332,878 49; county tax, \$562,555 46; total taxation on property, \$895,433 95; besides which a state tax is levied on the net proceeds of mines, at the same rate as the state tax on property. A poll tax of \$4, one half for state and one half for county purposes, is also levied on each male resident between 21 and 60 years of age. The receipts into the state treasury during 1874 were \$570,277, viz.: from property tax, \$275,369 65; tax on proceeds of mines, \$163,114 28; state poll tax, \$25,196 20; gaming licenses, \$16,756 23; fines, \$2,562 40; state prison, \$21,701 60; sales of state lands, \$42,480 42; the rest from miscellaneous sources. The total expenditures during the same period amounted to \$641,856 31, viz.: for salaries and contingencies of executive department, \$61,012 27; salaries and contingencies of judicial department, \$25,876; state library, \$2,601 78; support of state prison, including salaries of warden and deputy, \$64,090 27; charitable purposes, \$38,478 29, including \$12,121 28 for state orphans' home, \$25,429 36 for support of indigent insane, and \$927 65 of deaf mutes and blind; state capitol, \$15,464 40; support of schools, \$30,510 79; interest on state bonds, \$64,304 24; purchase of United States gold bonds for investment, \$271,783 77; construction of new prison at Reno, \$50,601 87; state university, \$1,479 38; miscellaneous purposes, \$15,652 55. The balance in the treasury on Dec. 31, 1874, was \$518,717 21 (\$489,177 07 coin and \$29,540 14 currency), viz.: belonging to the general fund, \$322,335 58; school funds, \$43,401 93; interest and sinking funds, \$67,437 57; university funds, \$30,316 10; various special funds, \$55,226 03. The state debt at the above date amounted to \$752,361 37, viz.: 10 per cent. bonds due April 1, 1881, \$160,000; 9½ per cent. bonds due March 1, 1882, \$120,000; 9½ per cent. bonds due March 1, 1887, \$380,000; accrued interest, \$19,833 32; outstanding warrants, \$73,528 05. The assets were as follows: state bonds belonging to school fund, \$104,000; United States bonds belonging to school fund, \$146,000; United States bonds belonging to sinking fund, \$100,000; United States bonds belonging to university fund, \$10,000; accrued interest, \$10,853 33; balance in treasury, \$518,717 21; total, \$889,570 54. According to the reports of the county auditors for 1874, the aggregate debt of the counties was \$1,296,208 48, of which \$1,026,183 14 was funded and \$270,025 34 floating; amount of cash in county treasuries, \$306,767 07; estimated value of property belonging to counties, \$444,175. The state institutions are the state prison, now near Carson City; the state orphans' home, in that city; and the state university, at Elko. New prison buildings are in course of construction near Reno. The indigent insane are supported by the state at a private institution in California, while the blind and deaf mutes are provided for at the California state institution.—The constitution requires the legislature to estab-

lish a uniform system of common schools, and also a state university to embrace departments of agriculture, mechanic arts, and mining. A common school is required to be maintained for at least six months of each year in each school district. The school law vests the general control of the schools in a state board of education consisting of the governor, surveyor general, and superintendent of public instruction; a county superintendent of public schools for each county, elected for two years; and a board of trustees of three or five members for each district, elected by classes for four years. By an act of 1873 all children between the ages of 8 and 14 years, unless otherwise educated, are required to attend the public schools at least 16 weeks in each school year, at least 8 weeks of which must be consecutive. The following statistics are for the year ending Aug. 31, 1874: number of children between 6 and 18 years of age, 6,315; number of school districts, 71; of schools, 108 (2 high, 12 grammar, 4 intermediate, 21 primary, 69 unclassified); of teachers, 115; pupils enrolled, 4,811; average daily attendance, 2,884; average duration of schools, $7\frac{1}{2}$ months; total receipts for school purposes, \$126,093 97, of which \$30,811 98 was derived from state apportionments, \$81,945 24 from county taxes, \$11,485 99 from district taxes, \$817 69 from rate bills, and \$1,533 07 from miscellaneous sources; total expenditure, \$124,301 64, of which \$83,548 88 was for teachers' wages, \$22,241 05 for sites, buildings, repairs, and furniture, and \$18,511 71 for other purposes; value of school property, \$121,011; amount of permanent school fund, \$250,000. The state university was established by an act of 1873, and the preparatory or academic department was opened in October, 1874. The legislature in 1875 appropriated \$20,000 for its support. An act was passed at the same session providing for an agricultural college, under the congressional land grant of 90,000 acres, for colleges of arts and mines, and for a normal school. According to the census of 1870, there were 314 libraries, with 158,040 volumes, of which 286 with 118,100 volumes were private. Of those not private, 1 was the state library with 20,000 volumes; 1 court and law, 250; 16 Sabbath school, 5,950; 2 church, 600; 8 circulating, 15,140. The number of newspapers was 12, issuing 2,572,000 copies a year, and having a circulation of 11,300; 5 were daily, 2 semi-weekly, and 5 weekly. The number of church organizations was 32 (5 Episcopal, 11 Methodist, 1 Mormon, 5 Presbyterian, and 10 Roman Catholic), having 19 edifices, with 8,000 sittings and property to the value of \$212,000.—The region within the limits of Nevada forms part of the Mexican cession of 1848. The territory of Nevada was created by act of congress of March 2, 1861, from a portion of Utah, and embraced the region bounded N. by the present boundary of the state, E. by the 116th meridian, S. by the 37th

parallel, and W. by California. A portion of California was included by the act within the limits of the territory, but the consent of that state to its transfer was refused. By the act of July 14, 1862, a further portion of Utah was added, extending the E. boundary to the 115th meridian. The act of March 21, 1864, enabled the inhabitants to form a state government, and, a constitution having been framed and ratified by the people, Nevada was declared a state by a proclamation of the president of Oct. 31 of that year. A third portion of Utah was added by the act of May 5, 1866, extending the E. boundary to the 114th meridian, and by the same act the portion of the state S. of the 37th parallel was added from Arizona. The first settlements within the present limits of the state were made by Mormons in Carson, Eagle, and Washoe valleys in the west, near the present towns of Genoa and Carson City, in 1848, and the two or three following years. Gold was discovered in 1849 in the same vicinity, near the site of the present town of Dayton, and attracted some miners; but at the time of the discovery of silver in 1859 the population did not exceed 1,000. From this period the growth of Nevada may be dated. Within two years the mines were fairly in operation, the number of inhabitants having risen to upward of 16,000 in August, 1861. The first discoveries embraced the Comstock lode. (See supplement.)

NEVADA. I. A S. W. county of Arkansas, formed since the census of 1870 from portions of Columbia and Ouachita counties, bounded N. by the Little Missouri river, a branch of the Washita, and drained by several tributaries of that stream and of Red river; area, 625 sq. m. The surface is rolling and generally well timbered. The valleys contain much productive soil. Capital, Mount Moriah. **II.** A N. E. county of California, bordering on Nevada, and drained by Middle and South Yuba rivers; area, 1,026 sq. m.; pop. in 1870, 19,134, of whom 2,627 were Chinese. The surface is generally mountainous, especially toward the east, which is traversed by the Sierra Nevada range. One half of the area is estimated to be occupied by mineral lands. Gold mining is the principal industry, and agriculture receives little attention, though there is much arable land, and timber is abundant. The county contains several of the richest and most productive quartz lodes in the state, and the placer diggings are not surpassed by any other. The number of mines in 1870 was 80, viz.: 25 hydraulic, 40 placer, and 15 quartz. The Central Pacific railroad passes along the S. border. The chief productions in 1870 were 5,548 bushels of potatoes, 10,183 gallons of wine, 50,741 lbs. of butter, and 4,804 tons of hay. There were 786 horses, 1,148 milch cows, 1,156 other cattle, 504 sheep, and 1,187 swine on farms; 1 manufactory of boots and shoes, 3 of iron castings, 2 of machinery, 4 of sash, doors, and blinds, 6 of tin, copper, and sheet-iron ware,

1 pork-packing establishment, 12 breweries, 1 flour mill, and 10 saw mills. Capital, Nevada.

NEVERS, a town of France, capital of the department of Nièvre, on the Loire, at the junction of the Nièvre, 180 m. S. E. of Paris; pop. in 1872, 22,276. Caesar mentions the town in his "Commentaries" under the name of Noviodunum. It was formerly the capital of the province of Nivernais. In the middle ages it was ruled by counts and afterward by dukes, and was annexed to the French crown in the 17th century. It is the seat of a bishop, and has a lyceum, an episcopal seminary, a theatre, and a picture gallery. The old city walls and towers still remain. The cathedral of St. Cyr is much dilapidated, but contains a famous flamboyant doorway and a remarkable spiral staircase. The palace of justice, formerly that of the dukes of Nevers, is a stately building, and the hôtel de ville contains a museum of Gallo-Roman antiquities and pottery. This industry employs more than 700 persons. The iron works are extensive, and there is a cannon foundry here for the navy.

NEVANSK, a town of Russia, in the government of Perm, near the source of the Neiva in the Ural mountains, 47 m. N. of Yekaterinburg; pop. about 20,000. It is the centre of one of the oldest and most important mining regions, in the midst of almost continuous forests. It contains a castle, built early in the 18th century by Prince Demidoff, with a fine tower which once served as a refinery for silver from the Altai. Excellent bar iron and lacquered ware are made.

NEVIN, John Williamson, an American clergyman, born in Franklin co., Pa., Feb. 20, 1803. He graduated at Union college in 1821, studied theology at Princeton, and continued there afterward as assistant teacher and wrote "Biblical Antiquities" (2 vols., 1828). He was licensed to preach in 1828. From 1829 to 1839 he was assistant teacher and professor of Hebrew and Biblical literature in the Presbyterian theological seminary at Allegheny City, and in 1833-'4 edited "The Friend," a weekly literary journal. In 1840 he removed to Mercersburg, and took charge of the theological seminary there; and in 1841 he became also president of Marshall college. In 1843 he published "The Anxious Bench," which was translated into German, and also a translation of Dr. Schaff's "Principle of Protestantism," with an introduction. In 1846 he published "The Mystical Presence;" in 1847, "The History and Genius of the Heidelberg Catechism;" in 1848, "Antichrist, or the Spirit of Sect and Schism." From January, 1849, to January, 1853, he edited the "Mercersburg Review." At the close of 1851 he resigned his situation as professor in the theological seminary, continuing to act as president of Marshall college until its removal to Lancaster in 1853. He was the originator and exponent of what is called the "Mercersburg system of theology," which arose on the occasion of some revival measures in 1843. It

endeavored to restore the Protestant sacramental faith of the 16th century, and opposed sects as a rejection of the actual incarnation of Christ in his church. The church is the body of Christ, and hence divine and an object of faith; its ministers hold a divine power by apostolic succession; and its sacraments are seals as well as signs of grace. Baptism is for the remission of sins; and Christ is really, if not physically, present in the eucharist.

NEVIS, an island of the British West Indies, in the Leeward group, 2 m. from the S. E. extremity of St. Christopher, in lat. 17° 14' N., lon. 62° 40' W.; area, 45 sq. m.; pop. in 1871, 11,735. With the exception of a narrow circle of fertile land bordering upon the coast, the whole island may be said to consist of a single mountain 2,500 ft. high, the upper parts of which are not susceptible of cultivation. The arable lands, comprising in all only 6,000 acres, are well cultivated. Sugar is the staple, and with molasses and rum forms the bulk of the exports. The exports in 1870 amounted to £64,119, the imports to £54,286. The public revenue in 1872 was £7,776, the expenditures £10,477. The island is governed by a president, an executive council, and a legislative assembly of 11 members. Charlestown, on the S. W. coast, is the capital and principal town, and has a good roadstead. Nevis was colonized by English emigrants from St. Christopher in 1628, was taken by the French in 1706, and restored by the peace of Utrecht; it was taken by them again in 1782, but restored by the peace of 1783. It was the birthplace of Alexander Hamilton.

NEW ALBANY, a city, port of delivery, and the capital of Floyd co., Indiana, on the Ohio river, 2 m. below the falls, and opposite the W. end of Louisville, Ky., 100 m. S. of Indianapolis; pop. in 1850, 8,181; in 1860, 12,647; in 1870, 15,396; in 1874, according to local authorities, 22,246. It is finely situated, with wide streets, at right angles, upon two benches or plains that sweep N. by a gentle rise from the river. To the west and northwest is a range of hills from 300 to 500 ft. in height, called the Knobs. The chief public buildings are the court house, erected at a cost of \$140,000; a fine city hall; the opera house, costing \$100,000 and capable of accommodating 2,500; the masonic and odd fellows' halls; three large hotels; the railroad depot; and 10 large public school buildings. The fair grounds in the N. E. suburb comprise 72 acres, and contain a race course and appropriate buildings. There are four cemeteries in the vicinity of the city, one of them national. The railroads now in operation that terminate at New Albany are the Louisville, New Albany, and Chicago, the Jeffersonville, Madison, and Indianapolis, and the Louisville and New Albany, the last passing over the bridge at the falls. A steam ferry plies between the city and the W. end of Louisville, and a bridge across the Ohio at this point is projected. The Ohio river, within a distance of two miles

above New Albany, has a fall of 29 ft., affording the finest water power in the west. The river trade amounts to from \$15,000,000 to \$20,000,000 a year. A large wholesale business is carried on. Manufacturing is the most important interest of the city, embracing 142 large establishments, which in 1873 employed

3,681 hands and a capital of \$7,947,500, and produced goods to the value of \$24,486,574. Cottons, woollens, glass, machinery, and iron, brass, and wood work of all kinds, are produced. The works of the star glass company with their buildings and necessary grounds cover 15 acres; they are the most extensive

New Albany.

glass works in the United States, and the only ones producing polished plate glass. There are two large pork-packing establishments, and six banks (three national), with an aggregate capital of \$1,500,000.—New Albany is divided into six wards, and is governed by a mayor and a common council of two members from each ward. It has an excellent fire department, two public market houses, a street railroad, and is lighted with gas. The assessed value of property is \$10,000,000, about a third of the real value. The public schools are graded and embrace 53 departments, including high schools for both sexes. De Pauw female college (Methodist) was organized in 1846 and chartered in 1866. In 1873-'4 it had 6 instructors, 101 students, and a library of 1,000 volumes. A newspaper with daily and weekly editions is published. There are 30 churches, viz.: 3 Baptist, 1 Christian, 2 Episcopal, 2 Lutheran, 13 Methodist, 5 Presbyterian, 2 Roman Catholic, 1 United Brethren, and 1 Universalist.—New Albany was laid out in 1813, and was incorporated as a city in 1839.

NEWARK, a port of entry and the chief city of New Jersey, capital of Essex co., situated on the W. bank of the Passaic river, 4 m. above its entrance into Newark bay, and 9 m. W. of New York; pop. in 1840, 17,290; in 1845, 25,433; in 1850, 38,894; in 1855, 51,711; in 1860, 71,941; in 1865, 87,428; in

1870, 105,059, of whom 69,175 were natives and 35,884 foreigners, including 15,873 Germans, 12,481 Irish, and 4,041 English. The number of families was 21,631; of dwellings, 14,350. The city is divided into 15 wards, is for the most part regularly laid out, and embraces an area of about 17½ sq. m. The streets are generally wide and airy, and are bordered with many fine residences. The main street, called Broad street, is very spacious and handsome, 132 ft. wide and 2½ m. long, shaded with majestic elms, adorned with numerous tasteful edifices, and skirting in its course Washington, Military, and South parks, which are embowered with lofty elms. There are about 140 m. of improved streets, of which nearly 100 m. are graded, and more than 30 m. paved. The city is supplied with water collected from a large number of springs on the neighboring high grounds into a reservoir, and thence distributed by pipes. It is also supplied with gas, and has a system of sewerage, about 30 m. of sewers having been completed. There are four cemeteries within the limits of the city: Woodland, Fairmount, Mount Pleasant, and the Catholic cemetery. Mount Pleasant, the oldest, occupies 40 acres of ground on the Passaic river, and is elegantly laid out in winding avenues thickly shaded by ornamental trees and flowering shrubbery. Besides the churches, the most noteworthy buildings are

the custom house, city hall, and several of the banks and insurance buildings. Newark has ample means of communication with New York, Philadelphia, and the surrounding country, railroad trains running to New York every few minutes through the day. The lines are the New Jersey, Newark and New York, Morris and Essex, Newark and Elizabeth, Paterson and Newark, Newark and Bloomfield, Newark and Hudson, Newark and Clinton, and Montclair railroads. The Morris canal brings the coal of Lehigh valley through the heart of the city. Several lines of horse cars run to various parts of the city and to the adjoining towns. The value of imports into the customs district from foreign countries for the year ending June 30, 1874, was \$19,020; of exports to foreign countries, \$83,997. The number of entrances in the foreign trade was 35, with an aggregate tonnage of 4,562; clearances, 42, of 7,399 tons; number of entrances in the coastwise trade, 53, of 13,153 tons; clearances, 46, of 11,537 tons. The number of vessels belonging in the district was 136, of 12,158 tons, viz.: 49 sailing vessels, 2,604 tons; 26 steamers, 2,612 tons; 53 canal boats, 5,563 tons; and 8 barges, 1,379 tons.—Newark is noted for the extent and variety of its manufactures, among the most important of which are jewelry, saddlery and harness materials, felt and silk hats, patent leather and morocco, carriages, varnish, ale and lager beer, trunks and valises, chemicals, cotton thread, clothing, boots and shoes, agricultural implements, fertilizers, machinery, and sewing silk. The smelting and refining of gold, silver, and lead ores is also a prominent interest. The latest and most complete returns of the trade and manufactures of the city (for the year ending Dec. 31, 1871) embrace 1,015 establishments, employing 29,174 hands; capital invested, \$34,407,670; wages paid, \$14,767,257; value of products, \$72,879,036. The business of banking was started in Newark in 1805. There are now 11 banks, with an aggregate capital of \$5,783,500; 5 savings banks and 3 trust companies, with assets amounting to \$21,572,629 35; 3 life insurance companies, with \$30,141,486 54 assets; and 16 fire insurance companies, with \$5,681,426 71 assets. The mutual benefit life insurance company, one of the most prosperous in the country, has upward of \$28,500,000 assets. The total capital and assets of the financial institutions amount to \$63,179,042 60. There is a board of trade with 150 members, chartered in 1869.—The city is governed by a mayor and a board of 30 aldermen, and has an efficient fire department and an effective police force. The receipts into the city treasury for the year ending Dec. 31, 1873, including a balance on hand at the beginning of the period of \$439,635 62, were \$6,857,788 62; disbursements, \$6,577,721 78; balance, \$280,066 85. The total debt, less sinking fund, on Dec. 31, 1874, was \$5,599,511 51; assets of the city, \$5,503,156 78. The assessed valuation of property has been as follows: 1866, \$50,866,700; 1867, \$54,917,200; 1868, \$62,794,957; 1869, \$72,058,486; 1870, \$77,015,279; 1871, \$86,985,341; 1872, \$97,330,341; 1873, \$102,047,840; 1874, \$105,623,710. The principal charitable organizations are the city reform school, Essex county home for the insane, Newark orphan asylum, German hospital, city dispensary, boys' lodging house and children's aid society, hospital of St. Barnabas, society for the relief of respectable aged women, home for the friendless, St. Michael's hospital, St. James's hospital and orphan asylum, St. Vincent's industrial school, St. Peter's orphan asylum and kindergarten, St. Mary's orphan asylum, and the New Jersey home for disabled soldiers. There is an excellent system of public schools, embracing a high school, 12 grammar schools, 20 primary schools, 2 primary industrial schools, 7 evening schools, and a Saturday normal school. The number of school buildings owned by the city is 21; value of sites, \$375,000; of buildings and furniture, \$645,000. The number of children between the ages of 5 and 18 years in 1873 was 30,045; number of pupils enrolled in day schools, 15,090; in evening schools, 1,495; number of teachers employed in day schools, 218; in evening schools, 35; in Saturday normal school, 4; expended for support of schools, \$187,553 57; for school houses, \$100,017 09. Newark academy, incorporated in 1795, is one of the oldest institutions in the state. There are several well attended Catholic schools. There are two libraries, that of the Newark library association, containing 20,000 volumes, and that of the New Jersey historical society, containing 6,000 volumes and 10,000 pamphlets, besides manuscripts of great value and rarity, and a cabinet of curiosities and relics. There are 6 daily (1 German) and 11 weekly (2 German) newspapers, and a monthly periodical. The number of churches (besides 10 missions) is 93, viz.: Baptist, 13; Congregational, 2; Episcopal, 11; German Evangelical Protestant, 1; Jewish, 3; Lutheran, 3; Methodist, 18; Methodist Protestant, 2; Presbyterian, 18; Reformed, 9; Roman Catholic, 8; Second Adventist, 1; Spiritualist, 1; Swedenborgian, 1; Unitarian, 1; Universalist, 1.—Newark was settled in May, 1666, by about 30 families from Milford and New Haven, Conn., under the lead of Capt. Robert Treat, afterward governor of Connecticut, to which he returned at a later period. In 1667 they were joined by about an equal number of settlers from Guilford and Branford, Conn., under the lead of the Rev. Abraham Pierson, their minister, who having in early life preached in Newark, England, gave that name to the new town. Their object seems to have been to establish a Puritan community, to be administered under the laws of God, by members of the church, on strictly democratic principles. The settlers laid out the town plat of Newark, with its spacious streets and parks as they now exist. During

the revolution the town was successively occupied by the American and British troops, and was subject to incursions from New York. On the establishment of peace it received a new impulse, and soon became very prosperous. It was incorporated as a city in 1836.

NEWARK, a city and the capital of Licking co., Ohio, at the confluence of three branches of the Licking river, on the Ohio canal and on the Baltimore and Ohio and the Pittsburgh, Cincinnati, and St. Louis railroads, 33 m. E. by N. of Columbus; pop. in 1850, 3,654; in 1860, 4,675; in 1870, 6,698. It is situated on a level plain, in the midst of a productive country, and is well built and laid out with spacious streets. In the vicinity are quarries of sandstone, an extensive coal mine, and several coal oil factories. The city contains two banks, graded public schools, and three newspapers.

NEWARK, a municipal and parliamentary borough of Nottinghamshire, England, on an E. branch of the Trent, 114 m. N. N. W. of London, with which it is connected by the Northwestern and Midland railways; pop. in 1871, 12,195. It is well paved and lighted with gas. The ancient church of St. Mary Magdalene, partly rebuilt in the time of Henry VI., and recently restored, is one of the largest and finest churches in the kingdom. Newark has a spacious market place, a town hall, grammar school, public charities, and a large trade in corn, coal, cattle, wool, and especially malt and flour. Here are the ruins of a castle in which King John died in 1216. Charles II. incorporated the town for its loyalty to his father during the civil wars.

NEWAYGO, a W. county of the southern peninsula of Michigan, watered by the Muskegon,

Marquette, and other streams; area, about 875 sq. m.; pop. in 1870, 7,294. The soil is fertile. The surface is nearly level and mostly covered with forests of pine, sugar maple, &c. The county is traversed by the Big Rapids branch of the Chicago and Michigan Lake Shore railroad, and by the Grand Rapids, Newaygo, and Lake Shore line. The chief productions in 1870 were 37,438 bushels of wheat, 10,385 of rye, 42,378 of Indian corn, 25,999 of oats, 66,746 of potatoes, 5,877 tons of hay, 8,726 lbs. of wool, 109,064 of butter, and 46,298 of maple sugar. There were 784 horses, 1,007 milch cows, 2,084 other cattle, 2,940 sheep, and 1,997 swine; 2 flour mills, and 11 saw mills. Capital, Newaygo.

NEW BEDFORD, a city, port of entry, and one of the capitals of Bristol co., Mass., in lat. $41^{\circ} 38' N.$, lon. $70^{\circ} 55' W.$, 50 m. S. by E. of Boston; pop. in 1870, 21,300. The municipal limits embrace an area 11 m. long by 2 m. wide; the city proper, about 2 m. long and 1 m. wide, is on the W. side of Acushnet river, whose mouth here forms a commodious harbor and is crossed by a bridge 4,000 ft. long. The notable public buildings are the city hall, a Doric granite structure, the Unitarian and Catholic churches, the custom house, the almshouse, which accommodates 400 inmates, the public library, and the house of correction. There is a strong fortification at the entrance of the harbor; and around Clark's point, at the S. end of the city, is a fine public drive $4\frac{1}{2}$ m. long. The city water works were constructed in 1867-'9, at a cost of nearly \$1,000,000. From the head of Acushnet river, which is dammed up to form a reservoir with a capacity of 400,000,000 gallons, the water is brought

New Bedford.

6 m., and is pumped for distribution to a height of 100 ft. The city has a paid fire department. A street railroad was constructed in 1872. The school system includes a high school and 23 grammar and primary schools, with 99 teachers

and 3,500 pupils. The public library, established in 1803, was assumed by the city in 1852, and became the first free public library in the United States. A fine building was erected for it in 1857, at a cost of \$45,000. In 1870 it had

30,000 volumes. In 1863 Miss Sylvia A. Howland bequeathed to the city \$100,000 for the increase of this library and the support of liberal education, and an equal sum for the introduction of water. There are 27 religious societies, a domestic missionary society with two free chapels, a young men's Christian association, a Roman Catholic hospital, an orphan asylum, and a "Union for Good Works." New Bedford has long been the chief seat of the American whale fishery, which was pursued here as early as 1755. In 1765 four vessels were engaged in it, and at the revolution from 50 to 60, most of which were destroyed during the war. The business revived, but was again prostrated by the war of 1812. In 1818 it received a fresh impulse, and continued to flourish till 1853-'4, which was the culminating point of its prosperity. At that time there were 410 whalers, of 132,966 tons, in the district, and the imports were 44,923 bbls. of sperm oil, 118,672 of whale oil, and 2,838,800 lbs. of whalebone. The panic of 1857, the destruction of 30 whalers by confederate cruisers during the civil war, the wrecking of 24 at one time in the N. Pacific in 1871, and the substitution of other articles for the products of the fishery, proved disastrous, and it is rapidly on the decline. In December, 1873, the vessels engaged in it in the United States numbered 171, of which 128, of 35,261 tons, belonged in New Bedford. The proceeds were 30,961 bbls. of sperm oil, value \$1,251,109; 25,729 of whale oil, \$413,555; and 150,598 lbs. of bone, \$162,645; these constituted about three fourths of the entire importation. The other imports in 1873 amounted to \$160,000; exports, \$32,350; duties collected, \$36,000; entries, 62; clearances, foreign 33, domestic 136. The loss occasioned by the decline of the whale fishery has been partly compensated by increased attention to manufactures. The principal establishments are the Wamsutta cotton mills, with a capital of \$2,000,000, running four mills with 86,000 spindles, and producing in 1873 goods to the value of \$2,500,000; the Potemka mills for print cloths, erected in 1871, with a capital of \$500,000, 2,000 looms, and 22,500 spindles, and products in 1873 of about \$1,000,000; the Gosnold iron mills, copper works, cordage factory, twist drill works, glass works, tannery, Prussian blue works, four oil and candle works, paraffine manufactory, five shoe factories, two manufacturing photographic establishments, gas works, kerosene oil works, two flour mills, and three paint mills. The aggregate value of the manufactured products in 1873 was about \$8,000,000. The valuation of property in 1874 was: real estate, \$11,665,400; personal, \$11,719,900. There are four national banks, with an aggregate capital of \$3,200,000; two savings banks, with deposits in 1874 of \$10,021,921; one fire and one marine insurance company; two daily and two weekly newspapers, and a weekly shipping list. There is a line of steamers to New York, and one to Martha's

Vineyard. The New Bedford railroad was formed in 1873 by a consolidation of roads running to Framingham, Mass., and was extended to the water front of the city. Large amounts of coal are brought here for distribution, and return freights extensively taken to points south. A branch road from Fairhaven, on the opposite side of Acushnet river, communicates with the Old Colony road, and affords an additional route to Boston and Cape Cod.—New Bedford was originally part of Dartmouth, from which it was set off as a town in 1787. It received a city charter in 1847. It was at one time the wealthiest city in the United States in proportion to its population.

NEW BERNE, or **Newbern**, a city and the capital of Craven co., North Carolina, the port of entry of the district of Pamlico, on the S. W. bank of the river Neuse at its confluence with the Trent, 40 m. from its mouth, and on the Atlantic and North Carolina railroad, 107 m. by rail S. E. of Raleigh; pop. in 1850, 4,681; in 1860, 5,432; in 1870, 5,849, of whom 3,829 were colored. Ocracoke inlet affords communication with the sea. There are lines of steamers to New York, Baltimore, and Norfolk. The city has a considerable commerce, principally coastwise. The chief articles of trade are cotton, lumber, naval stores, and fish. The value of foreign commerce for the year ending June 30, 1874, was \$12,212; entrances and clearances, 13, of 1,021 tons; entrances in the coastwise trade, 179, of 31,807 tons; clearances, 80, of 17,992 tons; belonging to the district, 67 vessels, of 1,412 tons. There are several turpentine distilleries, founderies and machine shops, grist and saw mills, manufactories of carriages, agricultural implements, &c. The city has an academy, several good private schools, a national bank, a daily and three weekly newspapers, a monthly magazine, and Baptist, Christian, Episcopal, Methodist, Presbyterian, and Roman Catholic churches. It was at one time the capital of the province of North Carolina.—During the civil war New Berne, which was defended by intrenchments and breastworks, was captured by Gen. Burnside, after a severe fight, March 14, 1862. Sixty-nine cannon and much ammunition were taken, and the city suffered considerably by fire.

NEWBERRY, a N. central county of South Carolina, bounded N. in part by the Ennoree and Tiger rivers, E. by the Broad, and S. by the Saluda; area, 616 sq. m.; pop. in 1870, 20,775, of whom 13,318 were colored. The surface is rolling, and the soil fertile, especially near the streams. It is traversed by the Greenville and Columbia and the Laurens railroads. The chief productions in 1870 were 41,914 bushels of wheat, 152,232 of Indian corn, 27,701 of oats, 14,072 of sweet potatoes, and 9,836 bales of cotton. There were 1,259 horses, 1,754 mules and asses, 2,379 milch cows, 3,109 other cattle, 2,801 sheep, and 6,967 swine. There were 9 manufacturing establishments. Capital, Newberry Court House.

NEWBERRY, John Strong, an American geologist, born at New Windsor, Conn., Dec. 22, 1822. His father in 1824 emigrated to Ohio, where he founded the town of Cuyahoga Falls. He graduated at the Western Reserve college in 1846, and at the Cleveland medical college in 1848. In 1849-'50 he travelled and studied abroad, and upon his return established himself in 1851 as a physician in Cleveland, Ohio. In 1855 he was appointed acting assistant surgeon and geologist in the expedition under Lieut. Williamson to explore the country between San Francisco and the Columbia river. The results of this expedition are embodied in vol. vi. of the "Pacific Railroad Reports." The reports of Dr. Newberry on "The Geology, Botany, and Zoölogy of North California and Oregon" were published separately in a quarto volume, with 48 illustrations. In 1857-'8 he accompanied Lieut. Ives in the exploration and navigation of the Colorado river, and prepared half of the report, containing, in the words of the commanding officer, "the most interesting material gathered by the expedition." In 1859 he was connected with another party sent out by the war department for the exploration of the San Juan and upper Colorado rivers. During the summer the party travelled over a large part of what is now southern Colorado, northern Arizona, and New Mexico, a region before almost unknown. The report of this expedition remains (1875) still unpublished. During the civil war Dr. Newberry was secretary of the western department of the sanitary commission. In 1866 he was appointed professor of geology in the school of mines of Columbia college, New York, and in 1869 became also state geologist of Ohio. He was one of the original corporators of the national academy of sciences, has been president of the American association for the advancement of science, and is president of the New York lyceum of natural history. His most valuable papers have been upon the drift and carboniferous formations, and on fossil fishes and plants.

NEW BRIGHTON, N. Y. See **STATEN ISLAND**.

NEW BRIGHTON, a borough of Beaver co., Pennsylvania, on the E. bank of Beaver river, here crossed by a bridge, 3 m. above its entrance into the Ohio, and on the Beaver and Erie canal and the Pittsburgh, Fort Wayne, and Chicago railroad, 25 m. N. N. W. of Pittsburgh; pop. in 1870, 4,037. It is a place of active business, and the river supplies water power for factories of various kinds, consisting of a large woollen factory, extensive flax mills, the largest chain factory in the United States, novelty works, a keg factory, a foundery, two machine shops, a planing mill, three large flouring mills, and various other smaller industrial works. There are graded public schools, a weekly newspaper, a national bank, two banking houses, and eight churches.

NEW BRITAIN, the name of one large and several smaller islands in the Pacific ocean,

between lat. 4° and 6° 30' S., and lon. 148° and 152° 30' E.; extreme length of the large island about 300 m., breadth from 5 to 50 m.; area, about 10,000 sq. m. It is of crescent shape, and is separated on the west from Papua by Dampier's strait, and on the northeast from New Ireland by St. George's channel, the former being about 50 and the latter 25 m. wide. There are several fine bays and harbors, and at Spacious bay, the E. headland of which is in lat. 5° 2' S., lon. 152° 7' E., there is supposed to be a channel extending across the island. In the interior there are high mountains, and in the north active volcanoes. Bordering the coast are extensive fertile plains, and much of the surface is covered with forests. The principal productions are palms, sugar cane, breadfruit, pigs, turtles, and fish. The inhabitants are a tribe of oriental negroes or negritos, well made, and very dark.

NEW BRITAIN, a town of Hartford co., Connecticut, on the Hartford, Providence, and Fishkill railroad, and a branch of the New York, New Haven, and Hartford railroad, 8 m. S. W. of Hartford; pop. in 1870, 9,480. It is lighted with gas, has a steam fire engine, and an ample supply of water is obtained from a reservoir of 175 acres, at an elevation of 200 ft., throwing a jet from the fountain on the public square to the height of 140 ft. The chief business is the manufacture of builders' hardware. There are also two extensive hosiery manufactories, employing several hundred hands each, malleable iron works, and manufactories of cutlery, jewelry, lace, hooks and eyes, cabinet hardware, harness trimmings, &c. It contains a national bank, a weekly newspaper, three large public school buildings, two seminaries, the state normal school, and six churches. It was formed from the town of Berlin in 1850.

NEW BRUNSWICK, a province of the Dominion of Canada, situated between lat. 44° 35' and 48° 5' N., and lon. 63° 47' and 69° 5' W.; average length N. and S. 180 m., average breadth 150 m.; area, 27,322 sq. m. It is bounded N. by Quebec and the bay of Chaleurs, E. by the gulf of St. Lawrence and Northumberland strait, which separates it from Prince Edward island, S. by Nova Scotia and the bay of Fundy, W. by Maine, and N. W. by Quebec. The province is divided into 15 counties, viz.: Albert, Carleton, Charlotte, Gloucester, Kent, Kings, Madawaska, Northumberland, Queens, Restigouche, St. John, Sunbury, Victoria, Westmorland, and York. These are subdivided into parishes. There are two cities: St. John (pop. in 1871, 28,805), the commercial metropolis, and Fredericton (pop. 6,006), the capital; and four incorporated towns: Moncton, Portland, St. Stephen, and Woodstock. The population of the province in 1784 was 11,457; in 1824, 74,176; in 1834, 119,457; in 1840, 156,162; in 1851, 193,800; in 1861, 252,047; in 1871, 285,594. Of the last number 237,837 were born in the province, 5,239 in Nova Scotia, 2,439 in Que-

bec, and 220 in other parts of Canada, 2,409 in Prince Edward island and Newfoundland, 23,065 in Ireland, 4,691 in Scotland, 4,558 in England and Wales, and 4,088 in the United States; 100,648 were of Irish, 83,598 of English, 44,907 of French, 40,858 of Scotch, 6,004 of Dutch, 4,478 of German, 1,701 of African, and 1,096 of Welsh origin, and 1,403 were Indians (chiefly Micmacs and Malicetes); 145,888 were males and 139,706 females. There were 49,384 families and 43,579 occupied dwellings. There were 19,002 persons over 20 years of age unable to read (10,197 males and 8,805 females), and 27,669 (13,245 males and 14,424 females) unable to write. There were 306 deaf and dumb persons, 216 blind, and 788 of unsound mind.—The surface of New Brunswick is generally flat or undulating. There are some elevated lands skirting the bay of Fundy and the St. John river, but the only section of a mountainous character is that on the border of Quebec in the north, where the country is beautifully diversified by oval-topped hills, from 500 to 800 ft. high, surrounded by valleys and table lands. The shores of the gulf of St. Lawrence and Northumberland strait, for about 15 m. inland, are low and skirted with marshes. The coast line of the province is 545 m. long, not including indentations of the land, and is interrupted only at the point of junction with Nova Scotia, where an isthmus not more than 14 m. wide connects the two provinces, and separates the waters of Northumberland strait from those of the bay of Fundy. The coast of this bay is generally bold and rocky. There are numerous good harbors, particularly on the S. portion of the E. coast. The principal bays are the Nepisiguit, opening into the bay of Chaleurs; Miramichi and Shediac, on the E. coast; Passamaquoddy, at the S. W. extremity of the province; and the harbor of St. John, on the S. coast. Bay Verte and Chignecto bay are opposite each other, the former E. and the latter W. of the isthmus that connects with Nova Scotia. The principal islands are Grand Manan, at the entrance of the bay of Fundy; Campo Bello and Deer islands, in Passamaquoddy bay; Portage island, in Miramichi bay; and Shippegan and Miscou islands, at the N. E. extremity of the province. The largest river is the St. John, which for 75 m. below the mouth of the St. Francis forms the boundary with Maine, and afterward entering the province flows S. E. for 225 m., emptying into the bay of Fundy at St. John. It is navigable by vessels of 120 tons to Fredericton, 84 m. from its mouth, and by small steamers to Grand Falls, 140 m. further up. The chief tributaries are the St. Francis (which separates the W. extremity of the province from Maine), Madawaska, and Green, from the north; the Tobique, Nashwaak, Salmon, Washademoak, and Kennebecasis, from the east; and the Aroostook and Oromocto, from the west. The St. Croix forms the S. portion of the Maine bound-

dary. It is about 125 m. long, and is navigable to St. Stephen, 15 m. above its mouth in Passamaquoddy bay. The Peticodiac, about 100 m. long, empties into the bay of Fundy near its head; it is navigable by large vessels for 25 m., and for schooners of 60 or 80 tons to the head of tide, 12 m. further. The N. portion of the province is drained by the Restigouche, which forms a part of the boundary with Quebec, and empties into the bay of Chaleurs. It is navigable by large vessels for 18 m. Its chief tributaries in New Brunswick are the Upsalquitch and Wetomkegewick. The Nepisiguit river after a course of about 100 m. empties into the bay of the same name. The Miramichi river flows N. E. about 225 m., and discharges into Miramichi bay; it is navigable by large vessels for 25 m., and for schooners to the head of tide, 20 m. further up. The Richibucto river, navigable for small vessels for 15 m., empties into the gulf of St. Lawrence, at Richibucto, near the entrance of Northumberland strait. The principal lakes are Grand lake, 25 m. long by 6 m. wide, which discharges into the river St. John, 50 m. from the sea; Oromocto lake, which gives rise to the river of the same name; and Grand lake on the Maine border, the source of the St. Croix.—The geological structure of the province is not remarkable. The N. W. portion is occupied by the upper Silurian formation. Bordering on this, and stretching S. W. across the province from Nepisiguit bay, crossing the St. John river just above Fredericton, are two belts of lower Silurian, enclosing a belt of granitic and similar rocks. S. E. of these the country is carboniferous. Small areas of the Devonian, Huronian, and Laurentian formations occur along the bay of Fundy. Gypsum, freestone, and grindstone abound. The deposits of bituminous coal in the central portion of the province are very extensive, but the mineral occurs in thin seams. Only a small quantity is mined. Salt springs are numerous. Copper is found on the banks of the Nepisiguit river and plumbago near St. John. Antimony, iron ore, manganese, and other minerals also occur in considerable quantities.—The climate is healthy, though it is subject to great extremes. The S. portion has a considerably milder temperature than the N., but the whole country is covered with snow for about four months of the year (from December to April). S. W. winds in summer often produce dense fogs on the bay of Fundy, which extend 15 or 20 m. inland. The autumn is long, and is the pleasantest season of the year, the air being clear and dry. The extremes of temperature in the interior are -30° and $+95^{\circ}$.—E. of the St. John the soil is deep and fertile; W. of that river it is poorer. Indian corn is grown in the south; wheat, barley, oats, buckwheat, rye, potatoes, turnips, peas, beans, &c., yield abundantly. Apples, pears, plums, cherries, currants, gooseberries, and strawberries thrive. Grass grows luxuriantly, especially on the ex-

tensive marshes that have been reclaimed from the sea, and the greater portion of every large farm is devoted to its production. The forests of pine, spruce, cedar, &c., which cover a large portion of the province, yield large quantities of timber for export and ship building; and lumbering is one of the chief industries of the people. Among wild animals are bears, moose and other deer, foxes, wild cats, raccoons, beavers, otters, and porcupines. The rivers and lakes abound in salmon, trout, chub, eels, and perch; and cod, mackerel, and herring are abundant on the coast, particularly in the bay of Chaleurs and the bay of Fundy. Lobsters abound, and there are prolific oyster beds on the E. coast.—The principal articles of manufacture are lumber, leather, woollen goods, wooden ware, paper, iron castings, mill machinery, locomotives, steam engines, &c. Ship building is extensively carried on. (For industrial statistics, see APPENDIX to this volume.) The fisheries and foreign commerce are important interests. The number of men employed in the fisheries for the year ending June 30, 1874, was 6,556; number of vessels, 131, of 2,518 tons; of boats, 3,351; value of vessels and boats, \$235,211; of nets and weirs, \$240,461. The value of the catch was \$2,685,793 91, of which salmon, herring, cod, and lobsters constituted the largest part; the other kinds were alewives, hake, pollack, oysters, smelts, mackerel, eels, bass, shad, and haddock. The value

of goods entered for consumption from foreign countries for the same period was \$10,223,871, including \$5,876,058 from Great Britain, \$3,894,484 from the United States, \$320,516 from the West Indies, and \$94,879 from France. The total value of exports was \$6,503,934 (including \$4,201,438 to Great Britain, \$1,247,364 to the United States, \$525,548 to the West Indies, \$77,375 to South America, \$26,716 to France, \$15,880 to the Canary islands, \$14,239 to Holland, and \$11,023 to Newfoundland), of which \$361,977 represented foreign, and \$6,141,957 Canadian produce, viz.: products of the mine, \$223,340; of the fisheries, \$392,772; of the forest, \$4,711,812; animals and their produce, \$208,902; agricultural products, \$110,856; manufactures, \$477,898; miscellaneous articles, \$15,377. The imports consist chiefly of cottons, woollens, fancy goods, hardware, iron, flour, tea, sugar, molasses, and spirits. The number of entrances was 2,784, with an aggregate tonnage of 775,638, of which 1,275, of 390,290 tons, were in ballast; clearances, 2,662, with an aggregate tonnage of 799,265, of which 25, of 12,351 tons, were in ballast; built during the year, 96 vessels, with an aggregate tonnage of 46,663. The number of vessels of all kinds belonging in the province at the close of 1873 was 1,147, with an aggregate tonnage of 277,850.—The statistics of the railroads in operation in the province for 1874 are contained in the following table:

LINES.	TERMINI.	Miles in operation in the province.
European and North American	St. John to Bangor, Me. (206 m.)	92
Fredericton	Fredericton Junction, on European and North American railway, to Fredericton	23
Intercolonial	St. John to Halifax, N. S. (276 m.)	132
Branch	Painsee Junction to Point du Chene	11
New Brunswick	Fredericton to Edmundston (170 m.); completed to Florenceville..	71
Branch	Woodstock Junction to Woodstock	9
New Brunswick and Canada	St. Andrews to Woodstock	93
Branches	{ Watts Junction to St. Stephen	19
	{ Debec Junction to Houlton, Me. (8 m.)	5
Total		455

The Intercolonial line is to be extended from Moncton N. and then W. to Rivière du Loup, Quebec, a distance of 374 m., of which about 200 m. lie in New Brunswick. The New Brunswick railway is intended to connect at Edmundston with the New Brunswick and Quebec line for Rivière du Loup, 90 m. further. There are four banks, with an aggregate capital of upward of \$1,500,000; eight branches of banks of other provinces; and a savings bank at St. John. The deposits in the government savings banks, exclusive of post office savings banks, on May 31, 1874, amounted to \$1,109,705.—The chief executive officer is the lieutenant governor, appointed by the governor general of the Dominion in council for five years, assisted by an executive council of nine members (president of the council, secretary and receiver general, attorney general, chief commissioner of public works, surveyor gen-

eral, and four without office), appointed by himself and responsible to the assembly. The legislative authority is exercised by a legislative council of 15 members, appointed by the lieutenant governor in council for life, and a house of assembly of 41 members, elected by districts. Voting is by ballot, and a small property qualification is required for voters, who must also be male British subjects and 21 years of age. The judicial power is vested in a supreme court, consisting of a chief justice and four associate justices, who hold circuit courts in each county, county and probate courts, and justices of the peace. The court of divorce and matrimonial causes is held by a single judge, and there are a vice-admiralty court with a judge and deputy judge, and a court for the trial and punishment of piracy and other offences on the high seas, consisting of the lieutenant governor, judges of the su-

preme court, and other officials. New Brunswick is represented by 12 senators and 16 members of the house of commons in the Dominion parliament. The balance in the treasury on Oct. 31, 1873, was \$151,400 38; receipts for the year 1873-'4, \$591,464 59, including \$516,155 from the Dominion government; expenditures, \$589,793 61, including \$12,749 for agriculture, \$60,607 for executive, legislative, and judicial departments, \$22,000 for immigration, \$25,000 for lunatic asylum, \$7,208 for public health, \$10,587 for public printing, \$201,264 for roads, \$8,844 for university, \$20,000 for bridges, and \$19,000 for steam navigation; balance in treasury Oct. 31, 1874, \$153,071 36. The penitentiary at St. John on Dec. 31, 1873, contained 30 convicts. The provincial lunatic asylum at St. John was opened in 1848; the number of inmates on Oct. 31, 1873, was 243 (128 males and 115 females). The capacity of the asylum is not equal to the demand for admission. According to the census of 1871, there were 9 hospitals, with 84 inmates; 2 orphan asylums, with 77 inmates; 9 other asylums (exclusive of the lunatic asylum), with 305 inmates; and 14 jails, with 149 inmates.—A system of free public schools was established by an act of 1871. These schools are under the general supervision of a chief superintendent of education for the province, with a county inspector for each county and boards of trustees for the several districts, and are supported by a provincial grant and a county tax equal to 30 cents per head, supplemented by a local tax, which includes a poll tax of \$1 per head. The expenditures from the provincial treasury for school purposes during the year ending April 30, 1874, were \$122,067 69. The number of schools in operation during the summer term ending Oct. 31, 1874, was 1,049, with 1,077 teachers and 45,539 pupils; number in attendance some portion of the year ending on that date, 60,467; number of school districts, 1,392; number of school houses, 1,050. There is a provincial training and model school at Fredericton. The university of New Brunswick at Fredericton was established by provincial charter as the college of New Brunswick in 1800, incorporated by royal charter under the name of King's college in 1828, and reorganized under its present title in 1860. It embraces a classical course of three years, and special courses in civil engineering and surveying, agriculture, and commerce and navigation. There is an annual scholarship of \$60 for one student from each county, who also receives tuition free, and there are 56 free scholarships, distributed among the counties and cities, exempting from the payment of tuition fees alone. In 1872-'3 the number of professors was 7; students, 51. There is a collegiate school connected with the university. Mount Allison Wesleyan college at Sackville, under the control of the Methodists, was organized in 1862, and is open to both sexes. It

has classical, scientific, and special courses, and provision is made for theological instruction. A male academy and commercial college, in operation more than 30 years, and a female academy, organized in 1854, are connected with it. In 1873-'4 these institutions had 15 professors and instructors (5 in the college), 213 students (34 in the college), and a library of 4,000 volumes. St. Joseph's college (Roman Catholic) at Memramcook has a commercial course of four years and a classical course of five years, both taught through the medium of the French and English languages. In 1874-'5 it had 18 professors and instructors, 140 students, and a library of 1,000 volumes.—The number of newspapers and periodicals published in the province in 1874 was 33, viz.: 4 daily, 3 tri-weekly, 21 weekly (1 French), 4 monthly, and 1 quarterly. The number of the inhabitants in 1871 belonging to the various religious denominations and the number of churches and buildings attached thereto are shown in the following table:

DENOMINATIONS.	Number of adherents.	Churches.	Buildings.
Baptists	70,597	226	238
Episcopalians	45,481	115	150
Methodists	29,856	113	186
Presbyterians	38,552	80	87
Roman Catholics	96,016	103	161
Other denominations	4,792	19	23
Total.....	285,594	656	795

Of the Baptists 27,866 were Freewill Baptists, and of the Methodists 26,212 were Wesleyans. The principal denominations not named in the table were Adventists (711), Christian Conference (1,418), Congregationalists (1,193), and Universalists (590).—New Brunswick and Nova Scotia originally formed one French colony, called Acadia or New France. The first settlement within the present limits of New Brunswick was made by the French on the bay of Chaleurs in 1639. Other settlements were made in 1672 on the Miramichi river and elsewhere on the E. coast. In 1713 Acadia was ceded to the English by the treaty of Utrecht. The first British settler established himself on the Miramichi in 1764, and in 1784 New Brunswick was separated from Nova Scotia, and erected into a distinct colony. The first legislative assembly met at St. John in January, 1786. At the close of the American revolution about 5,000 loyalists from the United States settled here, and their descendants now form a considerable portion of the population. In October, 1825, the standing timber in the region around Miramichi bay took fire, enveloping an area of 6,000 sq. m. in flames. Two towns and about 500 persons were destroyed. In 1848 responsible government was introduced. In 1867 New Brunswick became one of the original provinces of the Dominion of Canada.

NEW BRUNSWICK, a city and the capital of Middlesex co., New Jersey, situated at the head

of navigation on the S. W. bank of the Raritan river, about 15 m. above its mouth, at the terminus of the Delaware and Raritan canal, and on the New Jersey division of the Pennsylvania railroad, 28 m. S. W. of New York; pop. in 1860, 11,256; in 1870, 15,058. The oldest parts of the town are built on low land, but a large and by far the pleasantest portion is upon the high and sloping ground which, in the form of a crescent, half encircles the original location. This portion is well laid out with wide streets, and contains many handsome residences. The court house is near the centre of the city. The opera house and masonic hall are fine buildings. New Brunswick is largely engaged in manufactures, containing extensive India-rubber factories, and manufactories of harness, hosiery, iron, machinery, leather, paper hangings, &c. It has two banks, a high school and other public schools, several private schools, two daily and two weekly newspapers, two monthly periodicals, and 17 churches. The city is the seat of Rutgers college (Reformed), founded in 1770, occupying an elevated and beautiful situation in the N. portion. A grammar school and the state college of agriculture and the mechanic arts (as the scientific department) are connected with it. (See **RUTGERS COLLEGE**.) The theological seminary of the Reformed (Dutch) church, established here in 1810, occupies a commanding position N. of the college. It has three fine buildings, Hertzog hall, Suydam hall, and the library. In 1874-'5 it had 4 professors, 39 students, and a library of 20,000 volumes.—New Brunswick was settled about the close of the 17th century by emigrants from Long Island, and was

incorporated as a town in 1736. During the revolution it was at different times the headquarters of each of the opposing armies, and remains of their works are still to be seen in the vicinity. The city was incorporated in 1784.

NEWBURGH, a city and one of the county seats of Orange co., New York, on the W. bank of the Hudson river, 61 m. by the river N. of New York, and 84 m. S. of Albany; pop. in 1870, 17,014, of whom 4,346 were foreigners. It is the terminus of the Newburgh branch of the Erie railway. Ferries connect it with Fishkill Landing and Dutchess Junction, stations on the Hudson River railroad, on the opposite bank of the river, the last named station being the river terminus of the New York, Boston, and Montreal railway. It is situated on a steep slope rising from the river to a height of 150 ft. Water is supplied from Little pond, 3 m. distant, the works for which cost \$96,000. "Washington's Headquarters," an old stone mansion overlooking the Hudson, is owned and kept in order by the state. Besides its association with the revolutionary war and its great chief, the building contains numerous interesting relics of that period. Newburgh owns considerable shipping, and has an important trade, the receipts of lumber and produce by rail being extensive. Steamers run regularly to New York, Albany, and intermediate points. Its manufactures are extensive, embracing engines, boilers, and other machinery, iron castings, carpets, cotton goods, beer, horse blankets, brass, cement pipe, paper, pianos and organs, &c. There are three national banks, with a joint capital of \$1,550,000, and a savings bank. The city contains ten private

Newburgh.

schools, good public schools, embracing an academy and five grammar schools, a free public library under the charge of the board of education, and two daily and three weekly newspapers. The Newburgh theological seminary (United Presbyterian) was organized in

1804, and chartered in 1835. In 1873-'4 it had 3 instructors, 12 students, and a library of 3,450 volumes. There are 22 churches, viz.: 3 Baptist, 4 Episcopal, 5 Methodist, 6 Presbyterian, 2 Reformed, 1 Roman Catholic, and 1 Unitarian. The city was incorporated in 1865.

NEWBURYPORT, a city, port of entry, and one of the shire towns of Essex co., Massachusetts, situated on the S. bank of the Merrimack river, 3 m. from its mouth, and 34 m. N. N. E. of Boston, in lat. $42^{\circ} 48' 30''$ N., lon. $70^{\circ} 52' 3''$ W.; pop. in 1840, 7,160; in 1850, 9,572; in 1860, 13,401; in 1870, 12,595.

The Eastern railroad passes through it, and it is the terminus of a branch of the Boston and Maine railroad. Horse cars run to different parts of the city and to Amesbury, and several lines of stages ply to the adjoining towns. The city is situated on a swell of land rising gradually to the height of 100 ft. from the river, and

Newburyport.

commands a fine view of the ocean and the surrounding country. The streets are laid out regularly, and finely shaded with trees; and High street, the principal thoroughfare, extending for 3 m. parallel to the river, and about a quarter of a mile from it, is one of the most beautiful streets in New England. In the centre of the city is a fine mall, extending around a beautiful pond of six acres. Near the city is Oak Hill cemetery. The principal public buildings are the custom house, city hall, and court house. Some of the churches are of admirable architecture. Under the Federal street church are the remains of George Whitefield, who died here in 1770. The same church contains a whispering gallery, where a slight whisper can be heard 115 ft. The harbor is formed by the position of Plum island along the mouth of the river, and is safe and commodious. The bar at the mouth of the river is shifting, with 9 ft. of water at low and 17 at high tide. The value of imports from foreign countries for the year ending June 30, 1874, was \$227,353; exports to foreign ports, \$42,739; entrances in the foreign trade, 19, of 2,530 tons; clearances, 34, of 7,837 tons; entrances in the coastwise trade and fisheries, 633, of 63,405 tons; clearances, 607, of 69,678 tons; engaged in the cod and mackerel fisheries, 33 vessels, of 1,316 tons; belonging in the district, 67, of 12,865 tons. Ship building forms a prominent business of the place. Vessels were built here as early as 1680, and in 1766 there were 72 vessels on the stocks at one time. In 1854, 20,000 tons of shipping of different kinds were built, the vessels varying

from 100 to 1,600 tons, and employing 1,000 men. After that the business was depressed, but is now increasing, and 18 vessels, aggregate tonnage 15,000, were built in 1874, the largest being 1,608 tons. There are four manufacturing corporations, with an aggregate capital of \$1,200,000, employing 1,125 hands, running 35,216 spindles, and manufacturing 16,276,000 yards of print cloths and fine sheetings and shirtings annually. There are also manufactories of boots and shoes, combs, hats, steam pumps, paper, iron and brass castings, machinery, jewelry, &c. The city contains four national banks, with an aggregate capital of \$820,000; two savings banks, with deposits amounting to \$5,300,000; and an insurance company. It is divided into six wards, and is governed by a mayor, a board of aldermen of six, and a common council of 18 members, and has a police force, a police court, and a fire department. There are several charitable organizations, the most important of which is the old ladies' home of the society for the relief of aged females. The public schools of Newburyport have long occupied a high rank. The female high school was the first of the kind established in the country; the Putnam free school, supported by a fund of \$50,000, is open to all without regard to residence; these two have recently been consolidated with the male high school. The number of pupils enrolled in the public schools in 1873 was 2,070; average attendance, 1,579. For an account of the university of modern languages recently established here, see MASSACHUSETTS, vol. xi., p. 257. A daily, a semi-weekly, and a weekly newspaper

are published. The "Newburyport Herald" was established in 1792. A free library, founded in 1856 by a donation of Josiah Little, contains upward of 15,000 volumes, and is constantly increasing. There are 16 churches, viz.: Baptist, Christian, Congregational (5), Episcopal, Methodist (2), Presbyterian (2), Roman Catholic, Second Advent, Unitarian, and Universalist. — Newburyport was settled about 1635, but until 1764 formed a part of Newbury. It was distinguished for its patriotic spirit during the revolution. The first tea destroyed was in this town, having been taken from a powder house, where it had been deposited for safe keeping, and burned by the citizens in the public square. The first privateer fitted out in the United States was from this port, and the first volunteer company to join the continental army was here formed in response to an appeal of the clergy. On May 31, 1811, a great fire destroyed a large portion of the town and over \$1,000,000 worth of property. In the war of 1812 Newburyport was particularly distinguished for the bravery and success of its privateers. In 1851 a portion of Newbury was annexed to the town, and on May 14 of the same year a city charter was obtained. For the recent discovery of silver in the vicinity, see MASSACHUSETTS, vol. xi., p. 247.

NEW CALABAR. See CALABAR.

NEW CALEDONIA (called *Balade* by the natives), an island of Australasia belonging to France, in the S. Pacific, between lat. 20° and 22° 30' S., and lon. 164° and 167° E.; length from N. W. to S. E. 240 m., average breadth 28 m.; area, 6,769 sq. m.; pop. estimated at from 45,000 to 75,000. It is surrounded by dangerous rocks, sand banks, and coral reefs, and is accessible by only a few channels. It has several bays where ships may anchor near the shore, besides which there are secure harbors

at Port Balade on the N. E. part of the island and Port St. Vincent on the S. W. The interior is occupied principally by barren mountains, rising in some places to a height of about 6,000 ft., and abounding in granite, quartz, mica, steatite, and green amphibole. Coal, nickel, and iron are found; copper is plentiful at Balade; and in 1871 a gold mine was discovered, which soon attracted a number of Australian and Californian diggers. A few fertile valleys are interspersed, in which grow the cocoanut, banana, taro, mango, breadfruit, and yam. The sugar cane is of excellent quality and is much cultivated. There are many large and well watered plains which afford excellent pasturage. Sandal wood was formerly plentiful, but the supply is now nearly exhausted. Tripang is found in the surrounding waters. The natives resemble the Papuan or negro race, and speak a language kindred with the Australian tongues. They belong to different tribes, most of which are described as hospitable and honest. Cannibalism, which formerly existed, has entirely ceased. They are well formed, tall, and robust, but indolent. Their skin is deep black, and their hair coarse and bushy. They are fond of painting their faces, and even in settlements they wear but few garments. Their huts, built of spars and reeds, thatched with bark, and entered by a very small opening, bear some resemblance to beehives. The chief articles of food are yams and fish. — New Caledonia was discovered by Capt. Cook in 1774, and visited by D'Entrecasteaux in 1792. A settlement of Europeans at Balade was attacked by the natives in 1849, and several of the settlers were killed. The same year the captain and cook of the ship *Mary* were killed and eaten. The French took possession of the island in September, 1853, and established on it a station for their Pacific squadron and a

Numea, New Caledonia.

penal colony. In 1870 the number of colonists in the territory subject to the governor of New Caledonia, which also comprises the Loyalty islands and the island of Kunie or Isle des Pins, was 1,562; public functionaries, 289; troops, 754; immigrants, 1,176; non-political convicts, 2,302; political convicts, about

4,000. Numea, on Numea bay, near the S. W. extremity of the island, is the seat of the governor. The French have been repeatedly at war with the islanders, but hostilities were closed in 1857, when the most troublesome chief was made prisoner. French missionaries have made several prosperous settlements, and

cultivate plantations. They have introduced a variety of vegetables and fruits, including wheat and barley, and have been very successful in raising live stock. The number of the islanders who have embraced Christianity is estimated at about 5,000. They are found to be industrious and averse to drunkenness. The imports of the entire dependency were in 1870 valued at 3,249,182 francs, the exports at 203,650. The entrances into the ports were 10 French and 76 foreign vessels, the clearances 10 French and 77 foreign vessels. In 1872 the national assembly of France resolved to deport the communists to the peninsula of Ducos, and to allow them to engage in agriculture. Among them was Rochefort, who escaped in 1874.

NEW CASTLE, a N. county of Delaware, bordering on Pennsylvania, bounded E. by Delaware river and bay, which separate it from New Jersey, and drained by Brandywine, Christina, and other creeks; area, about 500 sq. m.; pop. in 1870, 63,513, of whom 10,192 were colored. It has a diversified surface and fertile soil. It is intersected by the Philadelphia, Wilmington, and Baltimore, the Wilmington and Reading, and the Delaware railroads. The chief productions in 1870 were 504,284 bushels of wheat, 1,002,519 of Indian corn, 353,371 of oats, 200,137 of potatoes, 31,490 tons of hay, 17,555 lbs. of wool, 765,746 of butter, and 4,435 gallons of sorghum molasses. There were 7,464 horses, 883 mules and asses, 11,733 milch cows, 1,364 working oxen, 6,817 other cattle, 5,185 sheep, and 9,988 swine. The number of manufacturing establishments was 459, chiefly in Wilmington, having a capital of \$9,995,175, and an annual product of \$15,093,131. The principal were 26 manufactories of carriages and wagons, 3 of freight and passenger cars, 6 of cotton goods, 1 of gunpowder, 6 of forged and rolled iron, 8 of castings, 18 of leather, 7 of machinery, 2 of matches, 16 of tin, copper, and sheet-iron ware, 7 of woollen goods, 36 flour mills, and 5 ship yards. Capital, New Castle.

NEW CASTLE, a borough and the capital of Lawrence co., Pennsylvania, on the Shenango river, at the mouth of Neshannock creek, 45 m. N. N. W. of Pittsburgh; pop. in 1870, 6,164. It is situated 2 m. above the junction of the Shenango with Mahoning river, on the Beaver and Erie canal, and on the Erie and Pittsburgh, and a branch of the Pittsburgh, Fort Wayne, and Chicago railroad. Its manufactures of iron and glass are extensive. There are also flour mills, three banks, a savings institution, graded public schools, four weekly newspapers, and ten churches.

NEWCASTLE. **I. William Cavendish**, duke of, an English general, born in 1592, died Dec. 25, 1676. He was the nephew of William Cavendish, founder of the ducal house of Devonshire, succeeded in 1617 to large estates, and devoted himself to poetry, music, and other accomplishments. In 1620 he was raised to

the peerage as Baron Ogle and Viscount Mansfield, and in 1628 was created earl of Newcastle-upon-Tyne. At the outbreak of the civil wars he sided with the king, to whose treasury he contributed £10,000, and took the field at the head of 200 cavaliers. He was intrusted with the command of the four northern counties, and raising an army of 10,000 men, he prostrated the power of the parliament in that part of England, defeated Sir Thomas Fairfax at Atherton Moor, June 30, 1643, and was made marquis of Newcastle. Subsequently he held the Scots in check at Durham, but was obliged in April, 1644, in consequence of the defeat of Col. Bellasis at Selby, to throw himself with all his forces into York, where for the next three months he sustained an investment by a greatly superior army under Fairfax. Upon the advance of the royal army under Rupert, he joined the latter with the greater part of the garrison, and endeavored to persuade him that, having raised the siege, he had better defer a battle until the arrival of the reinforcements. His advice was disregarded, and the battle of Marston Moor was fought, which ruined the royal cause in the north. He then forced his way with a few followers to Scarborough, set sail for the continent, and established himself in Antwerp. His estates having been sequestrated by parliament in 1652, he lived in extreme poverty during the protectorate; but on the restoration he received substantial honors, and in March, 1664, was created earl of Ogle and duke of Newcastle. Clarendon says he was "a very fine gentleman, active and full of courage." He was the author of "A New Method to Dress Horses" (published in French, Antwerp, 1658, and in English, with alterations, London, 1667), and of several comedies; and is said to have written the more licentious passages in his wife's comedies. His duchess sketched his character and career in her "Life of the thrice Noble, High, and Puissant Prince William Cavendish, Duke, Marquis, and Earl of Newcastle" (fol., London, 1667). **II. Margaret Cavendish**, duchess of, second wife of the preceding, an English authoress, born at St. Johns, near Colchester, Essex, about 1625, died in December, 1673. She was the youngest daughter of Thomas Lucas, and informs us that "it pleased God to command his servant nature to indue her with a poetical and philosophical genius even from her birth, for she did write some books even in that kind before she was 12 years of age." Joining the court at Oxford in 1643, she was appointed a maid of honor to Queen Henrietta Maria, and accompanied her to Paris, where she met the marquis of Newcastle, whom she married in 1645, and accompanied to Antwerp. At the restoration they returned to England, and the remainder of their lives they spent in retirement, perpetrating an unlimited amount of bad prose and worse poetry. Both in conversation and in print, each spoke of the other as

the greatest genius in the world, the duke being likened by his consort to Julius Cæsar. She was the more voluminous author of the two, nothing being too high or too low for her to attempt; and as she never revised her works "lest it should disturb her following thoughts," she produced 13 folios, 10 of which are in print. Walpole, in his "Catalogue of Royal and Noble Authors," calls her "a fertile pedant, with an unbounded passion for scribbling," and says that she kept a servant who slept on a truckle-bed in her room, and when during the night she felt inspiration, she would cry out, "John, I conceive;" whereupon he would arise and commit to paper what she dictated. The best known of her works are her two volumes of plays. She was buried in Westminster abbey.

NEWCASTLE, or Newcastle-under-Lyme. I. Thomas Holles Pelham, duke of, an English statesman, born in 1693 or 1694, died Nov. 17, 1768. He was the son and successor of Thomas Pelham, first Baron Pelham, and in 1711 came into possession of the large estates of his maternal uncle, John Holles, duke of Newcastle, whose title had expired with him. In 1714 he was created Viscount Haughton and earl of Clare, and in 1715 marquis of Clare and duke of Newcastle-upon-Tyne, with remainder, failing his issue male, to his brother. He entered political life as a whig and a supporter of the house of Hanover, in whose interests he raised a troop of horse to put down the Jacobites. Rewarded for his loyalty by admission into Walpole's ministry as secretary of state, he succeeded by industry, influential connections, and lavish expenditure of money, and also by the assistance of his brother Henry Pelham, in making himself feared and respected by those who despised his abilities, which were beneath mediocrity. He remained in office during the administration of Henry Pelham, and George II. complained that he could not appoint even a page of the back stairs while there were so many of the Newcastle footmen about him. In 1746 the Pelham brothers, apprehensive that the king was endeavoring to bring Lord Granville into power, suddenly resigned office with all their colleagues. An attempt was made to form a new ministry, and at the end of 40 hours the old cabinet was recalled, the king complaining bitterly that a man like Newcastle, who was not fit to be chamberlain to a petty court in Germany, should be forced on him and the nation as a minister. On the death of Henry Pelham in 1754, the duke succeeded to the premiership, but resigned in 1756 from inability to reconcile the discordant elements in his cabinet. In 1757 he was reinstated, with Pitt and Henry Fox as his chief supporters in the ministry, but was so overshadowed by the greatness of Pitt that he sank into insignificance and retired in disgust in May, 1762. In November, 1756, he was created duke of Newcastle-under-Lyme, with special remainder to Henry Fiennes Clinton, ninth

earl of Lincoln, who had married his niece, and who inherited the title in 1768. His administrative incompetency, and the long period (amounting to nearly 40 years) in which he held office, are among the anomalies of British political history. **II. Henry Pelham Fiennes Pelham Clinton**, duke of, a British statesman, born in London, May 22, 1811, died there, Oct. 18, 1864. He entered the house of commons as a conservative in 1832, bearing the courtesy title of Lord Lincoln, and in 1834-'5 was for a few months a lord of the treasury under Sir Robert Peel. He was afterward a prominent and active member of the opposition until Peel's return to power in 1841, when he was made chief commissioner of woods and forests. In 1846 he sustained Peel in his change of views on the corn laws, notwithstanding the desertion of other conservative leaders, and exchanged his office for that of chief secretary for Ireland, in order to secure the indorsement of his large agricultural constituency of South Notts by a new election. He was however defeated there, mainly through the opposition of his father, but was returned from the Falkirk district of burghs. He retired from office with Sir Robert Peel in the summer of 1846, and up to the period of his elevation to the house of lords (Jan. 12, 1851) continued to exercise considerable influence in parliament as one of the leaders of the small but brilliant band of Peelites. In 1853 he became secretary of state for the colonies in the Aberdeen ministry, in which capacity the functions of minister of war devolved upon him. Shortly after the outbreak of the Crimean war the colonial department was separated from that of war; and the duke, choosing the latter, received a share of the blame for the misconduct of military affairs. In January, 1855, he defended himself in the house of lords with great spirit; but the commons having ordered an inquiry, he resigned. He afterward visited the Crimea, and was present at the capture of Sebastopol. In 1859 he became a member of Lord Palmerston's administration as colonial secretary, and held the post till April, 1864. In 1860 he accompanied the prince of Wales on his visit to Canada and the United States. He married in 1832 the only daughter of the duke of Hamilton, from whom he was divorced in 1850. She bore five children, the eldest of whom, Henry Pelham Alexander, born Jan. 25, 1834, succeeded as sixth duke.

NEWCASTLE-UNDER-LYME, a municipal and parliamentary borough and market town of Staffordshire, England, near the right bank of the Trent, 140 m. N. W. of London; pop. in 1871, 15,948. It is well built, paved, and lighted with gas. The principal public edifices are the churches, town hall, literary and scientific institute, theatre, free grammar school (founded in 1602), and a range of almshouses for 20 poor females. It has manufactories of hats, paper, shoes, silks, cotton, and earthenware; coal and iron are mined in the vicinity.

NEWCASTLE-UPON-TYNE (anc. *Pons Ælii*, afterward *Monkchester*), a municipal and parliamentary borough and river port of England, the chief town of Northumberland, on the left bank of the Tyne, 8 m. from its mouth in the North sea, and 250 m. N. N. W. of London; lat. 54° 58' N., lon. 1° 35' W.; pop. in 1871, 128,443. It is built on three steep hills, and extends about 2 m. along the river, communicating with Gateshead on the opposite bank by a handsome stone bridge. A few remains of its ancient fortifications are yet standing. The streets are generally spacious, well paved, and lighted with gas, and many of the buildings are elegant. The old quarters have been largely rebuilt within a few years, and now present some of the finest streets and squares in the kingdom. A handsome edifice was erected in 1859 for public baths and wash houses. The "high level bridge" across the Tyne, built by Robert Stephenson, is supported by six massive piers 124 ft. apart, and has

a carriageway 90 ft. above the river, and over that a railway viaduct at a height of 118 ft. from the water. There are many hospitals, asylums for the deaf and dumb and the blind, learned and scientific societies, and a fine-art institution. The museum of the antiquarian society has the largest collection in England of Roman lapidary inscriptions and sculptures. The old castle, built in 1080 by Robert, eldest son of William the Conqueror, has been recently restored in many parts, and is one of the finest specimens of castellated Norman architecture in the kingdom. A theatre, a music hall, and assembly rooms are the principal places of amusement. There are three daily and five weekly newspapers. The manufactures, which are extensive, are glass of all kinds, iron ware, locomotives, railway and other carriages, paper, copperas, coal pitch, spirits of tar, varnish, soda, whiting, glue, vinegar, and soap. The Elswick iron works, erected in 1859 for the manufacture of the

Newcastle-upon-Tyne.

Armstrong gun, iron bridges, and armor for iron-clad ships, cover an area of 11 acres. Connected with them are shot, shell, and fuze factories, and a mechanics' literary institution for the benefit of the workmen. Ship building is prosecuted on a large scale, and the construction of iron steamships is a prominent branch of industry. The harbor has been much improved by dredging, and there is a fine quay 1,550 ft. long. The traffic is principally in coals (bituminous), for which Newcastle is the greatest mart in the world. The coal trade seems to have been important from the very earliest period of the town; the burgesses obtained from Henry III. in 1239 a license to dig the coals within the borough, and by the time of Edward I. the business had grown to such consequence that Newcastle was able to pay a revenue of £200. In 1615 the trade employed 400 ships, and extended to France and the Netherlands. The exportation of coke is also important, amounting to more than 200,000 tons annually. Lead is shipped

in large quantities; it is brought from Cumberland and the hills of western Northumberland and Durham, and is exported both in pigs and manufactured. This traffic is still more ancient than that in coals. The imports are chiefly agricultural products, wine, spirits, colonial produce, tallow, hides, tar, pitch, lime stone, bones, bristles, rags, oil, and timber. The following statement shows the movement of shipping in the foreign trade for the year ending Jan. 1, 1874:

FLAG.	ENTERED.		CLEARED.	
	Vessels.	Tonnage.	Vessels.	Tonnage.
British	2,667	914,018	4,037	1,581,564
Foreign	2,553	528,068	3,624	862,605
Total	5,225	1,442,081	7,661	2,444,169

Besides the above there is a large number of vessels engaged in the coastwise trade. The total value of foreign and colonial imports in

that year was £5,018,926; the exports of the produce of the United Kingdom amounted to £6,803,819. — Newcastle derived its ancient name of Pons Ælii from a bridge over the Tyne attributed to the emperor Hadrian, and its subsequent one of Monkchester from its monastic establishments. The holy well of Jesus Mound (now called Jesmond), about a mile from the town, was a favorite resort for pilgrims. During the reign of Charles I. the city was taken by the Scottish army under Lesley in 1640, and again in 1644. The borough is governed by a mayor, 14 aldermen, and 45 councillors.

NEWCOMB, Harvey, an American clergyman, born at Thetford, Vt., in 1803, died in Brooklyn, N. Y., Aug. 30, 1863. He removed to western New York in 1818, was a teacher for eight years, and from 1826 to 1831 edited several journals, the last being the "Christian Herald," at Pittsburgh, Pa. For the next ten years he was engaged in writing books for Sabbath schools. He was licensed to preach in 1840, and took charge of a Congregational church at West Roxbury, Mass., and subsequently was pastor in other places. In 1850-'51 he was assistant editor of the New York "Observer," also preaching for some time in Brooklyn, and in 1859 became pastor of a church in Hancock, Pa. He contributed largely to religious journals, and wrote in all 178 volumes, of which 14 are on church history, but most of them are books for children. They include "Young Lady's Guide," "Manners and Customs of the North American Indians" (2 vols.), and "The Cyclopædia of Missions" (1855).

NEWCOMB, Simon, an American astronomer, born at Wallace, Nova Scotia, March 12, 1835. He came to the United States in his youth, taught school several years in Maryland, and was employed as computer on the "Nautical Almanac" for 1857. He began his original investigations in theoretical astronomy in 1858, and in 1861 was appointed professor of mathematics in the navy, and ordered to the naval observatory. He negotiated the contract for the great telescope authorized by congress, supervised its construction, and planned the tower and dome in which it is mounted. He was a member and secretary of the commission created by congress in 1871 to provide for the observation of the transit of Venus, Dec. 9, 1874. The work of organizing parties, selecting their stations, and planning the system of observation fell chiefly on him. In 1872 he was elected a foreign associate of the royal astronomical society of England; and in 1874 he received that society's gold medal for his tables of Neptune and Uranus, and in the same year was elected a corresponding member of the institute of France. His most important astronomical works are: "On the Secular Variations and Mutual Relations of the Orbits of the Asteroids" (1860); "Tables of the Planet Neptune;" "Investigation of the Solar Parallax" (1867); "On the Action of the Planets on the Moon," communicated to the French

academy during a visit to France (1871); and "Tables of Uranus" (1873). He has also published "A Critical Examination of the Financial Policy during the Southern Rebellion" (1865), and has contributed to the "North American Review" and other periodicals articles on political economy, &c.

NEWCOME, William, an English archbishop, born at Abingdon, Berkshire, April 10, 1729, died in Dublin, Jan. 11, 1800. He was educated at Oxford, and distinguished himself as a tutor. He became bishop of Dromore in 1766, of Ossory in 1775, of Waterford in 1779, and archbishop of Armagh in 1795. The most important of his works are: "The Harmony of the Gospels" (1778); "Observations on our Lord's Conduct as a Divine Instructor" (1782); "New Critical Version of the Twelve Minor Prophets and Ezekiel" (1785-'8); "An Historical View of the English Biblical Translations" (1792); and "An Attempt toward Revising our English Translation of the Greek Scriptures" (1796).

NEWELL, Robert Henry, an American humorist, born in New York, Dec. 13, 1836. He was literary editor of the "New York Mercury" from 1858 to 1862, and was employed by the "World" from 1869 to 1874, when he became editor of the "Hearth and Home" weekly journal. He has published, under the pseudonyme "Orpheus C. Kerr," a series of letters on the civil war (4 vols. 12mo, 1862-'8); "The Palace Beautiful and other Poems" (1865); "Avery Glibun," an American romance (1867); "The Cloven Foot," an adaptation of "The Mystery of Edwin Drood" to American scenes and characters (1870); a second volume of poems entitled "Versatilities" (1871); and "The Walking Doll," a humorous novel of New York life (1872).

NEWELL, I. Samuel, an American missionary, born in Durham, Me., July 24, 1784, died in Bombay, India, March 30, 1821. He graduated at Harvard college in 1807, studied theology at Andover, was ordained at Salem, Feb. 5, 1812, and sailed in company with Judson for Calcutta. On his arrival the Bengal government ordered him to leave the country, whereupon he sailed for the Isle of France, thence to Ceylon, and finally in 1817 joined the Rev. Gordon Hall at Bombay. He was one of the signers of the paper which led to the formation of the American board of commissioners for foreign missions. In conjunction with Mr. Hall he wrote "The Conversion of the World, or the Claims of Six Hundred Millions" (Andover, 1818). **II. Harriet Atwood**, wife of the preceding, one of the first female missionaries from the United States, born in Haverhill, Mass., Oct. 10, 1793, died in the Isle of France, Nov. 30, 1812. She was married to Mr. Newell in February, 1812, and accompanied him to India. Her memoirs by her husband, with her letters, and a funeral sermon by Dr. Leonard Woods, have passed through many editions, and have been translated into several languages.

NEW ENGLAND, the N. E. portion of the United States, comprising the states of Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, and Connecticut. It extends from lat. 41° to $47^{\circ} 32'$ N., and from lon. $66^{\circ} 52'$ to $73^{\circ} 50'$ W., with an area of 68,460 sq. m., and a population in 1870 of 3,487,924. It has a coast line of about 700 m., without allowing for the smaller inlets, and constitutes a large part of the great peninsula which, including Nova Scotia, New Brunswick, and parts of Quebec, Canada, is formed by the Atlantic ocean, the St. Lawrence, and the connected waters of Lakes Champlain and George and the Hudson river. It was originally granted for colonization by James I. in 1606 to the Plymouth company under the name of North Virginia, and received its present name from Capt. John Smith, who in 1614 explored and made a map of the coast. —For the details of the geography and history of New England, see the articles on the states of which it is composed.

NEWFOUNDLAND, a British North American colony, comprising the island of the same name, and the coast of Labrador from Blanc Sablon bay (lat. $51^{\circ} 25'$ N., lon. $57^{\circ} 9'$ W.), at the W. entrance of the strait of Belle Isle, to Cape Chudleigh (lat. $60^{\circ} 37'$ N., lon. 65° W.), at the E. entrance of Hudson strait, a distance of about 750 m. (See LABRADOR.) The island lies at the mouth of the gulf of St. Lawrence, between lat. $46^{\circ} 37'$ and $51^{\circ} 40'$ N., and lon. $52^{\circ} 40'$ and $59^{\circ} 31'$ W., and is separated from Labrador on the northwest by the strait of Belle Isle, 12 m. wide. Cape Ray, its S. W. point, is 65 m. from Cape North, the N. E. point of Cape Breton. Its length N. and S. near the 56th meridian is 325 m., and near the 54th meridian 180 m.; its width varies from about 45 m. N. of the 50th parallel to 310 m. between Cape Ray and St. John's; area, 40,200 sq. m. The portion extending N. from Cape St. John on the N. E. coast around the N. extremity of the island, and thence S. to Cape Ray, a distance of about 450 m., on which the French have the right to fish, is known as the "French shore;" the remainder, from Cape Ray E. and N. to Cape St. John, about 610 m., is divided into 10 districts, embracing 15 electoral divisions (similar to counties), viz.: Bonavista, Burgeo and La Poile, Burin, Conception Bay with five divisions (Bay de Verdes, Carbonear, Harbor Grace, Portdegrave, and Southern), Ferryland, Fortune Bay, Placentia and St. Mary's, St. John's with two divisions (East and West), Trinity, and Twillingate and Fogo. The chief towns are St. John's (pop. in 1869, 22,553), the capital and commercial centre, on the S. E. coast, and Harbor Grace (pop. 6,770) and Carbonear (pop. 5,000), on Conception bay. Other important settlements are Twillingate (pop. 2,790), on Notre Dame bay; Bonavista (pop. 2,600), between Bonavista and Trinity bays; Brigus (2,000), on Conception bay; Greenspond, on Bonavista bay; Catalina and Trinity, on Trinity bay; Bay Roberts, on Conception bay;

Torbay, on the S. E. coast, and Burin, on Placentia bay. The population nowhere extends far inland, and the greater portion of the inhabitants are settled on the peninsula of Avalon and in the adjacent districts at the S. E. extremity of the island. The permanent population in 1763 was about 7,500; in 1804, 20,000; since which it has increased rapidly. The population according to subsequent censuses has been as follows: 1836, 75,096; 1845, 96,606; 1857, 124,288; 1869, 146,536, of whom 75,547 were males and 70,989 females; 1874, 161,455, of whom 8,651 were settled on the French shore, and 2,416 in Labrador. The figures for 1836 and 1845 do not include Labrador and the French shore. The inhabitants are chiefly emigrants or the descendants of emigrants from England and Ireland. The aborigines of Newfoundland, who called themselves Beoths, and painted themselves with red ochre, whence they were called Red Indians, are supposed to have become extinct. There are a few Micmac Indians from New Brunswick in the island.—The interior has never been thoroughly explored. In 1822 W. E. Cormack, a Scotchman, with a single attendant, crossed the island from Trinity bay to St. George's bay, and published a short account of his journey. In 1839 and 1840 a geological reconnoissance of the coast was made by Prof. J. B. Jukes, who in 1843 published a "General Report of the Geological Survey of Newfoundland." For some years past geological and topographical surveys by Alexander Murray have been in progress, and several annual reports have been made to the colonial government. The island is rugged and for the most part barren. The interior is an undulating plateau, interspersed at intervals of a few miles with low hills or ridges, marshes, and lakes. The principal ranges of hills are the Long Range mountains, which run in a N. E. direction from Cape Ray to the Humber river, by which they are cut, and thence N. to Bonne bay, and onward through the centre of the N. peninsula to Castor river; the Cape Anguille mountains, a triangular range near that cape, rising to a height of 1,200 ft. or upward; the Blow-me-down (properly Blomidon) hills, between St. George's bay and the Humber arm, attaining near the latter an elevation of 2,085 ft.; a range crossing the river Exploits, about 30 m. from its mouth, which at the north rises to a summit called Hodge's hill, and S. of the river is known as the Shutebrook hills; a range running N. E. and S. W., and dividing the waters of Gander bay from those of the bay of Exploits, which at the north, where it attains a height of nearly 1,000 ft., is called the Blue hills, and at the south Heart ridge; a range bordering the W. shore of Placentia bay, and extending to Bonavista bay, which is more than 1,000 ft. high; and two ranges in the peninsula of Avalon. The easternmost of these, which probably does not rise above 700 ft., is flanked by two conical hills, called "But-

terpots," about 20 m. apart, which are about 1,000 ft. in height; the western range attains in one of its peaks an elevation of about 1,400 ft. E. and N. E. of the valley of Bay East river are three hills, called "Tolts," which are probably more than 2,000 ft. high, the southern of which is named Mount Sylvester. The coast is for the most part precipitous and lofty, and is broken into numerous headlands and peninsulas by deep bays, which in turn are indented by innumerable smaller inlets. The sinuities measure several thousand miles. The W. coast is the most regular. The principal bays are Pistolet, at the N. extremity; Hare, Canada, White, Notre Dame, and the bay of Exploits, on the N. E. coast; Bonavista, Trinity, and Conception, on the E.; Trepassey, St. Mary's, Placentia, Fortune, Hermitage, and D'Espoir (called by many of the inhabitants Despair bay), on the S.; and St. George's bay, bay of Islands, Bonne bay, and St. John's bay, on the W. coast. Between White bay on the east and the gulf of St. Lawrence and strait of Belle Isle on the west the N. projection of the island forms an extensive peninsula. The peninsula of Avalon forms the S. E. extremity, and is connected with the mainland by an isthmus 3 m. wide, which separates Trinity bay N. E. from Placentia bay S. W. Between Placentia and Fortune bays is the peninsula of Burin. The most important capes are Cape Bauld, at the N. E. extremity of the island; Partridge point, at the entrance of White bay; Cape St. John, at the N. entrance of Notre Dame bay; Cape Freels at the N., and Cape Bonavista at the S. entrance of Bonavista bay; Cape St. Francis, at the S. entrance of Conception bay; Cape Race, at the S. E. extremity of the island; Cape Ray, at the S. W. point; Cape Anguille at the S. and Cape St. George at the N. entrance of St. George's bay; Point Riche, on the N. portion of the W. coast; and Cape Norman, at the N. W. extremity. At the most important and frequented points along the coast light-houses have been erected. There are numerous good harbors, but the entrance to many of them is obstructed by rocky ledges. Small islands abound in the bays and along the coast. The most important are Belle Isle, at the entrance to the strait of that name; Quirpon island, at the N. E. extremity; Groais, South Belle Isle, and St. Barbe or Horse island, off the N. E. coast; Twillingate and New World islands, in the bay of Exploits; Fogo island, E. of these; Random, in Trinity bay; Marasheen, in Placentia bay; and Brunet, in Fortune bay. The Miquelon islands and St. Pierre, off the extremity of the peninsula of Burin, which belong geographically to Newfoundland, are subject to France. The interior of the island is so thickly strewn with lakes and ponds that it is estimated that a third of the surface is covered with water. The most extensive lakes are Grand pond, about 15 m. N. E. of the head of St. George's bay, 50 m. long by 5 m. wide; Red Indian pond, 33

by 3 m.; Gander pond, W. of Bonavista bay, 30 by 2 m.; Terra Nova lake, 4 m. long by 2½ m. wide, discharging through the river of the same name into Bonavista bay; and George the Fourth's, Jameson, and Bathurst lakes, in the S. part of the island, whose position and size have not been accurately ascertained. The principal rivers are the river of Exploits, which flows from Red Indian pond, and after a N. E. course of 70 m. falls into the bay of Exploits; Terra Nova, about 100 m. long; Bay East, which flows into D'Espoir bay; Great and Little Codroy rivers, which empty into the gulf of St. Lawrence between Capes Ray and Anguille; and Humber, which discharges the waters of Grand pond, and after expanding into Deer lake falls into the Humber arm, an inlet of the bay of Islands. The Exploits, Humber, Terra Nova, and some other streams are navigable by canoes or flats.—All the great ancient rock systems between the lower Laurentian and the coal measures are more or less represented in different parts of Newfoundland. The series in descending order is as follows: carboniferous, Devonian, upper Silurian, lower Silurian, primordial Silurian, Huronian or Cambrian, upper Laurentian, and lower Laurentian. The lowest of these systems appears to constitute the principal mountain ranges, coming to the surface through the more recent deposits on the axes of anticlinal lines, or brought out by great dislocations, most of which are nearly parallel with each other in a general bearing of N. N. E. and S. S. W. This regularity of bearing explains the uniform N. E. and S. W. direction of the bays and of the principal lakes and streams. The Laurentian gneiss forms the Long Range, and is exhibited in the ranges in the S. W. portion of the island. A granitic and gneissoid belt stretches from the head of Placentia bay to Bonavista bay, and thence along the W. and N. shore of the latter to Cape Freels. The gneiss is also developed in the island of Fogo, and forms the nucleus of the S. E. extremity of the peninsula of Avalon. On the W. flank of the Long Range, on the upper part of Great Codroy river, large fragments of white crystalline limestone with graphite are found, and toward the northeast on the same range occur labradorite and other crystalline rocks, with masses of magnetic iron. In the peninsula of Avalon the crystalline rocks of the Laurentian period are succeeded by a set of slates, with conglomerate bands, diorites, quartzites, and alternating green and reddish, hard silicious and felsite slates, surmounted by a great mass of thick-bedded green and red sandstone, the latter passing into a moderately coarse conglomerate, with many pebbles of red jasper at the top. These occupy the greater portion of the peninsula. The calciferous formation yields fossils on Canada and Hare bays, and appears along the W. coast N. of St. George's bay. Rocks of upper or middle Silurian age are indicated by the presence of the characteristic fossils on White and Exploits bays. The carbon-

iferous series occupies a large area in the vicinity of Grand pond and on St. George's bay. Building stones, including granite, sandstone, and limestone, are abundant in the island. Marble of various kinds occurs on the bay of Islands, and the fossiliferous limestone of Topsail head on Conception bay takes a high polish, and furnishes a handsome variegated marble. Gypsum abounds in the vicinity of the Codroy rivers and elsewhere in the S. W. part of the island, and bituminous coal is found in the carboniferous formation, where also brine springs frequently occur. Iron ore has been found. A lead mine was for some time worked at La Manche, at the head of Placentia bay, but with little success, though the lode is very promising. Copper mines have been opened at several points, but, with the exception of that at Tilt Cove on Notre Dame bay, they have nearly all been discontinued. The Tilt Cove mine has been in successful operation since 1865, and in the five years from 1869 to 1873 inclusive 22,404 tons of ore were exported. A vein of nickel has been discovered here, and a small quantity of ore has been extracted.—The climate, tempered on the one hand by the Gulf stream and on the other by the arctic current, is neither so cold in winter nor so hot in summer as on the adjacent portions of the continent. The weather is extremely variable, being often very mild in midwinter, and on the other hand raw and cold in midsummer. Spring is the most disagreeable and trying season, owing probably to the large floes of ice brought down from the north, and to the breaking up of the ice in the gulf of St. Lawrence, which affects the climate of the S. and W. portion of the island. The W. coast has a milder climate than the E. Dense fogs are prevalent, principally in summer, along the S. and S. W. shores of the island and the coast of the peninsula of Avalon, but they do not extend far inland. The N. portion of the island is said to be quite free from them. The fogs and violent gales, which are common, render the coast of Newfoundland dangerous to navigation. The prevailing winds vary from S. W. to W., N. W., and N., except in February and March, and sometimes April, when N. E. winds prevail. The climate, except for those suffering from pulmonary diseases, is very healthy. The mean temperature at St. John's for the eight years from 1857 to 1864 inclusive was $41\frac{1}{4}^{\circ}$, the highest annual mean being 44° in 1863, and the lowest 37° in 1864; average annual fall of rain and melted snow, 59.94 inches, the greatest fall being 82.4 inches in 1860 and the least 42 in 1857. The highest temperature observed was 89° in July, 1857, and the lowest -14° in February, 1863.—In the interior, so far as known, the summits and sometimes the sides of the hills and ridges are thinly covered with a stunted vegetation, consisting of berry plants and dwarf bushes of various species, and are called "the barrens." The sides of those hills that afford natural drainage and the borders of the lakes and riv-

ers are clothed with forests, consisting chiefly of fir, birch, pine, juniper, larch, wych hazel or yellow birch, mountain ash, alder, aspen, and spruce. These trees are generally small and stunted, though the fir and birch sometimes attain considerable size. The largest and best timber is in the valleys of the Humber, the Exploits, the Gander, and the Gambo (the last two S. of the Exploits), where the pine and spruce are of the finest description. All the best timber and the best land are back from the coast. The ground here is often covered with a creeping bush, a species of yew, called in Canada the ground hemlock. The frequent peat marshes are covered with grasses, rushes, &c., while the other valleys and level tracks produce abundant pasturage. Much of the country is covered with lichens and reindeer moss.—Large portions of the island are believed to be adapted to grazing, but few domestic animals are kept. Sheep raising has been retarded by the great number of dogs kept by the inhabitants. Agriculture has been but little attempted, and chiefly in the southeast, where the soil and climate are least favorable. There is much arable land about the heads of the bays, on Humber river, the river of Exploits, and other streams. The region about the bay of Islands and along the W. coast S. of it has been found to contain extensive fertile tracts, and the climate here is better adapted to agriculture than on the S. and E. coasts. The interior is believed to contain much arable land, and the marshes are thought to be in large measure reclaimable. The principal crops that may be successfully cultivated are barley, oats, potatoes, turnips, cabbages, peas, beans, carrots, &c. Wheat will ripen in some places; its cultivation has been attempted only on the smallest possible scale. Hops thrive, and strawberries, currants, gooseberries, cherries, &c., grow in the gardens, while numerous species of berries are found wild. The number of acres under cultivation in 1869 was 41,715. During the last two or three years, with successful fishing seasons, considerable progress has been made in agriculture.—The principal wild animals are the caribou, bear, wolf, hare, beaver, marten, wild cat, and fox. The Newfoundland dog, so famous for its size, sagacity, and fidelity, is now rarely found of pure blood, the animals commonly known by the name being crosses of innumerable varieties. Land and aquatic birds abound. The adjacent waters swarm with cod, caplin, herring, seals, &c., and salmon were formerly abundant in the streams. The fisheries are the chief wealth of the colony, employing directly or indirectly nine tenths of the inhabitants. The number of fishermen is about 32,000. The principal fisheries, in the order of importance, are the cod, seal, herring, and salmon. The cod fishery is pursued around the shores of the island and on the coast of Labrador, from June to October; the average annual catch is about 1,500,000 quintals. The seal fishery begins about the first of March and terminates in May.

In 1873, 107 vessels, with an aggregate tonnage of 15,080 and 8,062 men, of which 20, of 5,766 tons and 3,595 men, were steamers, were engaged in it, and about 525,000 seals were taken. The chief seats of the herring fishery are Labrador, Bonne bay, bay of Islands, St. George's bay, and Fortune bay. In the bay of Islands it is pursued during the winter. The average catch is about 175,000 barrels. The salmon fishery is prosecuted to some extent in Labrador, but chiefly in the bays on the E. coast of the island; the average quantity taken annually is about 6,500 tierces. (See FISH-ERIES, and SEAL FISHERY.) Newfoundland has scarcely any manufactures, excepting a few establishments at St. John's. Its commerce is important. The value of imports and exports at different periods has been as follows:

YEARS.	Imports.	Exports.
1834	£618,757	£826,659
1854	964,527	1,019,572
1864	1,067,062	1,111,380
1870	1,386,635	1,297,974
1871	1, 58,172	1,810,892
1872	1,399,180	1,188,958
1873	1,409,730	1,858,498
1874	1,532,227	1,528,841

The principal countries with which the commerce is carried on are the United Kingdom (imports from in 1873, £505,708; exports to, £450,424), Canada (imports, £377,732; exports, £74,174), British West Indies (imports, £46,388; exports, £60,063), Spain (exports, £217,454), Portugal (exports, £180,624), Italy (exports, £32,608), United States (imports, £355,253; exports, £44,479), French West Indies (imports, £57,196; exports, £29,544), and Brazil (exports, £244,413). The principal articles of import in 1873 were flour, meal, and hard bread (£380,568), manufactured goods (£259,061), meats (£120,218), molasses (£80,552), leather and leather ware (£74,303), earthen, glass, and hardware (£59,153), butter and cheese (£58,498), besides cordage and cables, coal, fishing tackle, salt, sugar, tea and coffee, tobacco and cigars, wood and wooden ware, wines, spirits, &c. The preceding statements relate only to the island of Newfoundland, exclusive of the French shore. The exports in 1873 from the entire colony, including Labrador and the French shore, were as follows:

ARTICLES.	Quantity.	Value.
Dried codfish	1,316,845 qtls.	£1,065,159
Salmon	7,304 tierces.	27,065
Herring	138,937 bbls.	64,549
Other fish	4,860
Cod oil, crude	1,049,580 gals.	121,479
“ “ refined	97,272 “	16,485
Seal oil	1,571,220 “	168,865
Other fish oil	57,204 “	2,659
Seal skins	452,587	101,525
Copper ore	5,553 tons.	40,492
Nickel ore	120 “	750
Other articles	17,698
Total	£1,631,086

The number of vessels entered at the various ports in 1873 was 1,146, with an aggregate tonnage of 218,122; cleared, 937, tonnage 193,902; belonging in the colony, 1,301, tonnage 68,185. —There are no railroads in Newfoundland, and the means of communication by land are imperfect. Steamers ply between the principal settlements and St. John's. Transatlantic steamers touch at St. John's semi-monthly for nine months, and monthly during the three winter months. The most important places are connected with St. John's by telegraph, and the island, as the nearest point of North America to Europe, occupies a prominent position as the centre of telegraphic communication between the two continents. The New York, Newfoundland, and London telegraph company, incorporated in 1854, has the monopoly of landing cables, and has associated with itself in the privilege the Atlantic and French cable companies. The colony has since April 15, 1874, the right under the charter of purchasing the interests of the company, and the policy of exercising the right has been much discussed. There are two banks at St. John's, with a capital of £50,000 each; aggregate assets, May 31, 1873, £739,111; average circulation of notes, £189,098; of specie, £76,614. There is also a savings bank at St. John's, with a branch at Harbor Grace, having together at the above date 2,102 depositors, and deposits to the amount of £189,281.—The executive power is vested in a governor, appointed by the crown during pleasure, and an executive council of not more than seven members, appointed by the governor, and responsible to the assembly. The legislative power is vested in a legislative council of not more than 15 members (present number 13), appointed by the crown or governor during pleasure, and a house of assembly of 31 members, elected by the people for four years, unless sooner dissolved by the governor. The right of suffrage is conferred upon all male subjects of Great Britain, 21 years old and upward, who have occupied a dwelling house as owners or tenants for two years immediately preceding the day of election. Voting is *viva voce*. The number of registered electors at the election of 1873 was 20,759. The legislature meets annually at the end of January or the beginning of February. The supreme court consists of a chief justice and two assistant judges, each of whom holds a circuit court in one of the three circuits, northern, central, and southern. The vice-admiralty court is held by the chief justice. A court of civil and criminal jurisdiction, with summary process, is held in summer on the Labrador coast by a single judge, who passes from point to point in a revenue cruiser. There are also minor courts and justices of the peace. Judges and justices of the peace are appointed by the governor during pleasure. The revenue of the colony is derived exclusively from a tariff on imports. There is no municipal or other body authorized to levy

taxes or lay assessments. The only direct taxation is a land tax or ground rent for sewerage and a house or tenant tax for the supply of water in St. John's, levied under acts of the legislature. The revenue in 1874 amounted to £185,334, the expenditures to £198,290, the difference being partly made up by the excess of revenue in previous years, there being a balance of £3,300 in favor of the colony at the close of 1873. The public debt on Dec. 31, 1874, was £239,396. The penitentiary is at St. John's, where there is also a lunatic asylum. For school purposes the island is divided into districts, and in each a board of education consisting of Catholics for the Catholic schools, and another consisting of Protestants for the Protestant schools, are appointed by the governor in council. These boards have the general management of the schools in their respective districts, subject to the approval of the governor in council. The governor with the advice of the council also appoints a Catholic and a Protestant inspector, to inspect the schools and report upon their condition. The sum of £750 (£400 for Protestants and £350 for Catholics) is appropriated annually for the training of teachers. Two scholars from each electoral division are entitled to £25 each for their board, lodging, and tuition in one of the academies or higher schools of the island. The money appropriated by the legislature for educational purposes has hitherto been divided between the Protestants and Catholics in proportion to their numbers; the act of April 29, 1874, provides for a further division among the various Protestant sects. This act does not go into effect until July 1, 1875, after a census has been taken, upon which and subsequent decennial censuses the denominational appropriations are to be based. It increases the number of inspectors to three. In the schools under government control a small tuition fee is required of pupils able to pay. Besides those established by the governmental boards, the schools of the colonial church and school society (an English association, under the auspices of the established church), and several established and controlled by the different religious denominations, receive aid from the government. The amount expended for educational purposes in 1872 was £14,852; in 1873, £15,316. The number of schools in operation in 1874 was 293, with a total attendance of 13,597 pupils, of which 157 with 7,805 pupils were Protestant, and 136 with 5,792 pupils Catholic. Besides these there are grammar schools at Harbor Grace and Carbonear, an Episcopal, a Wesleyan Methodist, and a general Protestant academy at St. John's, and at the same place an Episcopal theological institute and St. Bonaventure college (Catholic). There are 13 newspapers published in the island, viz.: 1 tri-weekly, 5 semi-weekly, 5 weekly, and 2 bi-weekly, all issued at St. John's, except one weekly at Harbor Grace. Newfoundland contains two Roman Catholic bishoprics, St. John's

and Harbor Grace, two Wesleyan Methodist superintendencies, and an Episcopal bishopric, with a bishop and a coadjutor. In 1874 there were 64,486 Roman Catholics, 59,605 Episcopalians, 35,551 Wesleyan Methodists, and 1,813 of other sects. The number of places of worship in 1869 was 188, viz.: Episcopal, 81; Catholic, 59; Wesleyan Methodist, 42; other, 6.—Newfoundland was discovered by John or Sebastian Cabot in 1497 or 1498. Within a few years the island was frequented by the Portuguese, Spanish, and French for its fisheries, and subsequently by the English. On Aug. 5, 1583, Sir Humphrey Gilbert, in command of four armed vessels, entered the harbor of St. John's and took formal possession of the island in the name of Queen Elizabeth. Among the earliest attempts at settlement was that of Mr. Guy, a Bristol merchant, in 1610, who founded a colony at Mosquito cove in Conception bay, which remained but a short time. In 1614 Capt. Richard Whitburn, of Exmouth in Devon, was sent by the admiralty to Newfoundland to establish order among the fishermen and correct the great abuses that prevailed. He made an attempt to impanel juries in the most frequented harbors, and was the first to introduce the forms of law in Newfoundland. A year or two after he was appointed governor of a colony of Welshmen, established by Dr. William Vaughan in the southern part of the island, at a place now known as Little Britain. About this time fixed habitations were erected by the fishermen at various points along the coast. What may be considered the first permanent colony was established by Sir George Calvert, afterward Lord Baltimore, on the S. E. peninsula, to which he gave the name of Avalon, probably in 1623, though some authorities say in 1621. About 10 years after this some colonists from Ireland came over under Lord Falkland, and a party of English under Sir David Kirk in 1654, about which time 15 settlements, comprising 300 families, had been made. About 1620 the French had established a station at Placentia. In 1633 Charles I. established a code of regulations, but the island still continued without a regular government. In the reign of William III. the three fishing captains first arriving in any harbor each summer were designated admiral, vice admiral, and rear admiral respectively of that harbor, and became magistrates, empowered to decide all fishery rights and civil causes. Until the peace of Utrecht in 1713 the ports were frequently the scenes of warfare between the English and French, one and the other power alternately gaining possession of them. The English government was also opposed to the settlement of their own people, and broke up their establishments on the ground of their being likely to monopolize the fishery, and prevent it from becoming a nursery for British seamen. The treaty of Utrecht gave Great Britain the sole sovereignty of the island, but

permitted the French to catch and dry fish on the shores from Cape Bonavista N. around the N. point of the island, and thence S. to Point Riche. The present limits of the French shore were defined by the treaty of 1783. In 1728 a governor was first appointed, but he was for a time almost powerless, being opposed by the fishing admirals. For many years the only law was the proclamations of the governors. In 1750 a court of oyer and terminer was established. For some years prior to 1767 Capt. Cook, the famous navigator, was engaged in surveying the coast. His charts are still in use, being among the best and in some cases the only trustworthy ones. Newfoundland suffered severely from the non-intercourse act passed by the first provincial congress and carried out in 1775. Dependent upon New England for supplies to the annual value of nearly £350,000, when these were suddenly cut off and the coast and harbors were ravaged by American privateers, the inhabitants were reduced to the greatest distress before they could be relieved by the protective measures of the mother country. In 1792 the supreme court was established. In 1805 the first post office was established at St. John's, and in 1806 the first newspaper was published there. In 1832 a representative assembly was granted to the island. The present form of government was organized in 1855. In 1856 Newfoundland was connected by a telegraphic cable with the American continent, and in 1866 the first Atlantic cable furnishing permanent communication with Europe was landed. The question of joining the Dominion of Canada as a province has several times come before the people at elections for members of assembly, but the proposition has been voted down. Labrador, with Anticosti and the Magdalen islands, was annexed to Newfoundland in 1763, but in 1774 they were placed under the government of Lower Canada. In 1809 Labrador and Anticosti were reannexed to Newfoundland. In 1825 Anticosti, with the portion of Labrador W. of Blanc Sablon bay, was again transferred to Lower Canada. Difficulties have at various times occurred between the French and the colonists regarding their respective rights on the French shore, which have retarded the development of that portion of the island, the French claiming the exclusive right of fishery and that the English have no right to form permanent settlements there.—See "History of Newfoundland," by L. A. Anspach (London, 1819), and by the Rev. Charles Pedley (London, 1863).

NEW HAMPSHIRE, one of the thirteen original states of the American Union, bounded N. by the province of Quebec, Canada, E. by Maine and the Atlantic, S. by Massachusetts, and W. by Vermont, from which it is separated by the

west bank of Connecticut river. It is situated between lat. 42° 40' and 45° 18' N., and lon. 70° 37' and 72° 37' W.; length from N. to S. about 180 m., extreme breadth 93 m., average breadth 50 m.; area, according to the late state survey, 9,392 sq. m. The state is divided into 10 coun-

Seal of the State of New Hampshire.

ties, viz.: Belknap, Carroll, Cheshire, Coös, Grafton, Hillsborough, Merrimack, Rockingham, Strafford, and Sullivan. According to the census of 1870, the cities were: Concord, the capital, containing 12,241 inhabitants; Dover, 9,294; Manchester, 23,586; Nashua, 10,543; and Portsmouth, 9,211. Among the more important towns are Claremont, 4,053; Exeter, 3,437; Farmington, 2,063; Franklin, 2,301; Gilford, 3,361; Hanover, the seat of Dartmouth college, 2,085; Haverhill, 2,271; Keene (made a city in 1874), 5,971; Laconia, 2,309; Lancaster, 2,248; Lebanon, 3,094; Littleton, 2,446; Milford, 2,606; Newport, 2,163; Pembroke, 2,518; Peterborough, 2,236; Rochester, 4,103; Somersworth, 4,504; Weare, 2,092; and Winchester, 2,097. The original population of New Hampshire was almost exclusively of English and Scotch descent, and the rural districts still remain without much intermixture. The population of the state and its rank in the Union, according to the national enumerations, have been as follows:

YEARS.	White.	Colored.	Total.	Rank.
1790	141,097	788	141,885	10
1800	162,998	860	163,858	11
1810	213,490	970	214,460	16
1820	243,236	786	244,022	15
1830	268,721	607	269,328	18
1840	284,036	538	284,574	22
1850	317,456	520	317,976	22
1860	325,579	494	326,073	27
1870	317,637	580	318,200	31

Of the total population in 1870, which included 23 Indians, 155,640 were males and 162,660 females; 288,689 were native born, of whom 242,374 were born in the state, 11,404 in Maine, 16,510 in Massachusetts, and 12,837 in Vermont; and 29,611 were of foreign birth,

including 12,955 born in British America, 2,679 in England, and 12,190 in Ireland. The density of population was 34.3 persons to a square mile. There were 72,144 families, with an average of 4.41 persons to each, and 67,046 dwellings, with an average of 4.75 to each. From 1860 to 1870 there was a decrease of 2.38 per cent. in the population, this being the only state except Maine in which there was not an increase. The number of male citizens 21 years old and upward was 83,361. There were in the state 78,766 persons between the ages of 5 and 18 years; the total number attending school was 65,824. There were 7,618 10 years old and over unable to read, and 9,926 unable to write. Of the latter 1,992 were native and 7,934 foreign born; 7,656 were 21 years of age and upward, including 4,257 males. The number of paupers supported during the year ending June 1, 1870, was 2,636, at a cost of \$235,126. Of the total number (2,129) receiving support June 1, 1870, 1,754 were of native and 375 of foreign birth. The number of persons convicted of crime during the year was 182; in prison June 1, 1870, 267, of whom 201 were native and 66 foreign. The state contained 206 blind, 170 deaf and dumb, 548 insane, and 325 idiotic. Of the total population 10 years of age and over (260,426), there were engaged in all occupations 120,168; in agriculture, 46,573, of whom 15,666 were laborers and 30,749 farmers; in professional and personal services, 18,528, including 664 clergymen, 7,481 domestic servants, 4,686 laborers, 349 lawyers, 565 physicians and surgeons, and 1,987 teachers; in trade and transportation, 8,514; and in manufactures and mechanical and mining industries, 46,553. The total number of deaths was 4,291, or 1.35 per cent. of the population. There were 953 deaths from consumption, there being 4.5 deaths from all causes to one from that disease, which was a greater ratio of deaths from consumption than in any other state; from pneumonia, 364 deaths, there being 11.8 deaths from all causes to one from that disease; cholera infantum, 139; diphtheria and scarlet fever, 147; enteric fever, 302; and diarrhoea, dysentery, and enteritis, 177. —New Hampshire has but 18 m. of seacoast, and the shore in most places is a sandy beach, bordered with salt marshes. There are numerous creeks and coves, which form harbors for small craft; but Portsmouth, at the mouth of the Piscataqua, is the only haven for large ships. The great feature in the topography is a mountainous ridge extending through the state in a direction E. of N. and parallel to the western border. West of this lies the Connecticut river basin; to the east the valleys of the Androscoggin, Saco, and Merrimack rivers. From the Massachusetts line to Warren in Grafton co., 80 m., the height of this ridge averages 1,500 ft., the most prominent mountains being, according to the recent survey by Prof. Hitchcock, Monadnock, 3,186; Sunapee, 2,683;

Smart's, 2,500; Cuba, 2,927; and Piermont, 2,500. Between Warren and Randolph in Coös co., 40 m., the height of the ridge averages 4,000 ft., as it consists of the main line of the White mountains, the most prominent mountains being Moosilauke, 4,811 ft.; Blue, 4,370; Kinsman, 4,200; Lafayette, 5,259; Haystack, 4,500; Twins, 4,920; Field, 4,070; Webster, 4,000; Jackson, 4,100; Clinton, 4,320; Pleasant, 4,764; Franklin, 4,904; Monroe, 5,384; Washington, 6,293; Clay, 5,553; Jefferson, 5,714; Adams, 5,794; and Madison, 5,365. The lowest gaps in this section are the Woodstock notch, 1,655 ft.; Franconia notch, 2,014; Pinkham notch, 2,018; White Mountain notch, 1,914; and Dixville notch, 1,831. The height of the remaining portion averages 2,000 ft., the highest points being Randolph, 3,043; peak in Erving's Location, 3,156; Pisgah, 2,897; Carmel, 3,711; and the highest elevation along the northern boundary, 2,917 ft. The lowest gaps along the whole line are at the Orange summit of the Northern railroad, 990 ft.; at the Warren summit of the Boston, Concord, and Montreal railroad, 1,063; at the Milan summit of the Grand Trunk railroad, 1,087; at the Newbury summit of Concord and Claremont railroad, 1,161; and at the summits of proposed railroads in Harrisville and Stoddard, 1,265 and 1,560. The country S. of the White mountains and E. of the great watershed is mostly below 600 ft., save a few peaks like Kearsarge, 2,943, Gunstock, 2,394, Croteched, 2,066, Great Moose, 1,404, and Crople Crown, 2,100. The average elevation of the whole state is 1,200 ft. Considering the whole area of the state, there is one peak over 6,000 ft., 8 between 5,000 and 6,000, 14 between 4,500 and 5,000, 20 between 4,000 and 4,500, 28 between 3,000 and 4,000, and nearly 40 between 2,000 and 3,000. The White mountains cover an area of 1,270 sq. m. The general slope of the country is from N. to S. With the exception of Niagara falls, the mountain scenery of New Hampshire attracts more tourists than any other natural object in the United States. (See WHITE MOUNTAINS.) —The Connecticut river, which is the largest stream, rises near the N. extremity, and with Hall's stream forms the W. boundary; the chief tributaries which it receives from this state are Hall's, Indian, and Perry streams, and the Upper Ammonoosuck in the north, and the Sugar, Cold, Ashuelot, Mohawk, Israel's, John's, Lower Ammonoosuck, Oliverion, and Mascema in the south. The Merrimack is formed by the junction of the Pemigewasset, which rises in the Franconia mountains, and the Winnipiseogee, the outlet of the lake of the same name, at Franklin, and runs S. through the middle of the state to Massachusetts. Baker's river, rising near Moosilauke mountain, unites with the Pemigewasset at Plymouth. Other important tributaries are the Newfound, Contoocook, Piscataquog, Souhegan, and Nashua rivers on the west, and the Soucook and Suncook on the east. The Piscataqua river is formed by a

union of the Salmon Falls and Cochecho rivers and Great bay at Dover point, draining nearly one eleventh of the area of the state; and the Piscataqua and Salmon Falls rivers constitute part of the boundary line between Maine and New Hampshire. Great bay, a tidal basin containing an area of about 9 sq. m., extends to Exeter, and receives the waters of the Belknap, Lamprey, Oyster, Squamscot, and Winnicut rivers. The Piscataqua river from Dover point to Portsmouth is deep and about half a mile wide. Through its channel Great bay discharges its waters at ebb tide with such swiftness that Portsmouth harbor has never been known to freeze over. It is one of the most secure and commodious harbors on the coast, into which ships of the largest capacity can enter. The Merrimack and its branches, and the Salmon Falls, have numerous cataracts, furnishing a large amount of water power to manufacturing towns. The Androscoggin has a small part of its course in the N. E. part of this state, and the Saco has also its source among the White mountains, and runs S. E. into Maine. The Saco near its head waters passes through the celebrated notch, a remarkable chasm 2 m. long, and where narrowest only 22 ft. wide. The Margalloway, which falls into Lake Umbagog, has part of its course in New Hampshire. About one sixteenth of the surface of this state is covered with water, embracing about 1,500 streams and numerous lakes and ponds. Winnipiseogee is the largest and most beautiful lake; it is about 25 m. long by from 1 to 10 broad, with an area of nearly 72 sq. m., and contains 267 islands, and its shores are indented with numerous bays. Umbagog lake, about 10 m. long and 5 broad, on the boundary between Maine and New Hampshire, is one of the sources of the Androscoggin; four Connecticut lakes, the source of the river of the same name, are in the north; and Mascoma, Newfound, Ossipee, Sunapee, and Squam lakes, and several smaller bodies of water, are the sources and recipients of many streams.—The rocks of New Hampshire are chiefly eozeic, belonging to the Laurentian, Atlantic, Labradorian, and Huronian, as defined by the state geologist. Small areas of Cambrian slates and larger ones of supposed Helderberg occur in the W. and S. W. portions of the state. Lithologically the rocks are gneiss, granite, felsite, ossipyte, andalusite gneiss and schists, mica, talcose, hydro-mica, and hornblende schists, clay slates, limestones, and quartzites. The most recent investigations indicate the existence of no good reasons for regarding the New Hampshire formations as altered palæozoic. Not much has been done in the working of metallic ores. Iron has been mined at Franconia and Bartlett, and there are smaller veins at Landaff, Piermont, and Gilford. The ores are magnetic and specular. A blast furnace has been erected at Franconia, but the amount of pig thus far produced has been small, and the works have been aban-

doned. Copper, zinc, and lead ores, most of the last argentiferous, are found in a large number of towns. In Madison a galena rich in silver has been worked extensively. A lead mine, largely argentiferous, and containing also a considerable quantity of copper, is successfully worked in Warren. Large deposits of copper sulphuret exist in Gardner's mountain, in Lyman and Monroe. Pyrites is abundant in Hanover, Lebanon, Croydon, and Unity, suitable for the manufacture of sulphuric acid. A vein containing oxide of tin in small quantity, and associated with arsenic, occurs in the town of Jackson. Gold is mined from the quartz in Lisbon, where are the quartz mills; two companies are at work, and since the beginning of operations about \$30,000 worth of gold has been sold to the United States mint. Granular quartz has been worked in the towns of Unity and Keene, and applied to a variety of purposes. It is ground between millstones and bolted, to be used either as a polishing powder or for the preparation of sand paper at the manufactory of that article in Rockingham, Vt. It has also been mixed instead of barytes with white lead. The quartz of Lyndeborough is used in the manufacture of glass. Acworth, near Bellows Falls, is celebrated for its beryls, gigantic specimens of which are found in the collections of minerals throughout Europe. Tourmalines and mica are also found in great perfection. The latter is extensively quarried at Alstead, a few miles S. of Acworth, and at Grafton, 35 m. N. It is sold at from \$2 to \$3 a pound, to be used for the windows in stoves, for lanterns, compass cards, &c. Other quarries are in Springfield and Alexandria. Sulphuret of molybdenum is found in many places, especially at Westmoreland; and graphite or plumbago is also a common mineral, which is worked for the manufacture of crucibles at Taunton, Mass. Steatite or soapstone is also found in many localities, as at Orford, Haverhill, Richmond, Weare, Warner, and Keene. It is obtained at the quarry in Francestown in large blocks, which are cut to the dimensions of 6 ft. by 3 and 7 ft. by 5, as well as into slabs and smaller blocks. It is used for stoves, fireplaces, sinks, rollers used in dressing cotton warp, and other purposes. The mills for sawing the stone from Francestown are at Nashua. Granite is extensively quarried at Concord, Plymouth, Hooksett, Manchester, Milford, Fitzwilliam, Roxbury, Troy, Farmington, and Marlborough. The variety known as Concord granite is fine-grained, soft, and well adapted for monuments as well as for buildings, and takes a high rank in the estimation of architects.—The soil of New Hampshire is not generally very fertile, but by industry and skill the inhabitants have in great measure overcome its natural defects. The best lands are in the valleys of the rivers, some of which are subject to occasional overflows. The N. part of the state is chiefly pasture and wood land. The climate is severe,

being somewhat colder than that of Maine, but more steady. Difference of elevation within the state causes great difference in the degree of temperature; so much even as 20° to 25° between the valleys and the more elevated positions. In summer the heat sometimes rises to 100°, and in winter the cold has been known to freeze the mercury in the thermometer. In the neighborhood of the White mountains the winters are excessively cold, and the peaks are covered more or less with snow eight months in the year, from which circumstance their name has been derived. The Mt. Washington expedition in the winter of 1870-71 showed that the weather at the altitude of 6,300 ft. is characterized by violent winds, whose velocity rose as high as 130 m. an hour, by more abundant precipitation of moisture than the low country, and a much lower average temperature; there was a fall of 55 inches for the year, against 46 at Newfound lake, the region of greatest rainfall elsewhere in the state. The Merrimack valley below Concord is the warmest part of the state; and the abundant waterfalls here have caused the growth of the manufacturing towns of Manchester, Nashua, Suncook, and Hooksett. All parts of New Hampshire are exceedingly healthful, and cases of remarkable longevity are very numerous. The cold weather begins about the last of October and continues till May; and from the latter part of November till the opening of spring the whole country is usually covered with snow, and the rivers are frozen.—The natural productions include the oak, pine, hemlock, ash, spruce, beech, birch, and other trees, which are largely exported in the shape of lumber. The sugar maple is abundant. The native animals, though scarce, are not yet exterminated; wolves, bears, and other wild beasts are still found in the N. part of the state, and occasionally commit depredations on the farms. Wild fowl and game are abundant, and both lakes and rivers are stocked with fish.—The farm lands of New Hampshire in 1870 comprised 2,334,487 acres of improved and 1,271,507 of unimproved land, including 1,047,090 acres of woodland. The total number of farms was 29,642, of which 1,376 comprised from 3 to 10 acres, 2,064 from 10 to 20, 7,194 from 20 to 50, 10,107 from 50 to 100, 8,804 from 100 to 500, 75 from 500 to 1,000, and 6 over 1,000. The average size of farms was 169 acres; percentage of improved to total land in farms, 68·8. The cash value of farms was \$80,589,313; of farming implements and machinery, \$3,459,943; total amount of wages paid during the year, including value of board, \$2,319,164; total estimated value of all farm productions, including betterments and additions to stock, \$22,473,547; orchard products, \$743,552; produce of market gardens, \$119,997; forest products, \$1,743,944; home manufactures, \$234,062; value of animals slaughtered or sold for slaughter, \$3,720,243. The chief productions were 189,222 bushels

of winter and 4,399 of spring wheat, 47,420 of rye, 1,277,768 of Indian corn, 1,146,451 of oats, 105,822 of barley, 100,034 of buckwheat, 58,375 of peas and beans, 4,515,579 of potatoes, 612,648 tons of hay, 155,334 lbs. of tobacco, 1,129,442 of wool, 5,965,080 of butter, 849,118 of cheese, 99,469 of hops, 1,800,704 of maple sugar, 56,944 of honey, 2,668 of wax, 2,446 gallons of wine, 2,352,884 of milk sold, and 16,884 of maple molasses. The total value of all live stock on farms was \$15,246,545. There were 39,095 horses, 90,583 milch cows, 40,513 working oxen, 91,705 other cattle, 248,760 sheep, and 33,127 swine. Besides these there were 4,240 horses and 13,368 neat cattle not on farms.—New Hampshire ranks high as a manufacturing state, and is especially noted for the extent of its textile industries. According to the census of 1870, only Massachusetts, Rhode Island, and Pennsylvania ranked above New Hampshire in the value of cotton goods produced. In the 36 cotton mills of this state were 19,091 looms and 447,795 frame and 302,048 mule spindles. The principal products of the 41,469,719 lbs. of cotton used were 89,326,701 yards of sheetings, shirtings, and twilled goods, 75,000 of lawns and fine muslins, 40,843,969 of print cloth, 442,696 of flannel, 1,845,199 of ginghams and checks, 5,260,000 of cassimeres, cottonades, and jeans, 237,026 lbs. of bats, wicking, and wadding, 28,300 of cordage, lines, and twines, and 1,595,700 seamless bags. The 156 woollen mills had 351 sets of cards, with a daily capacity in carded wool of 41,550 lbs., 909 broad and 699 narrow looms, and 117,057 spindles. The materials used comprised 1,079,120 lbs. of cotton, 1,380,000 of shoddy, and 8,785,832 of domestic and 793,433 of foreign wool. Among the products were 184,800 pairs of blankets, 2,481,416 yards of cassimeres and doeskins, 184,200 of felted cloth, 13,141,565 of flannels, 75,000 of frocking, 1,001,000 of kerseys, 720,507 of satins, 32,000 of tweeds and twills, 110,075 lbs. of rolls, and 485,600 of yarn. In the production of worsted goods, the state ranked after Massachusetts, Pennsylvania, and Rhode Island, and after those states and New Jersey in the production of printed goods. In 1870 the products of mining were valued at \$323,805, including stone worth \$309,720, silver quartz \$10,000, lead \$3,000, and zinc \$1,085. Other important industries are the production of boots and shoes, hosiery, lumber, starch, and wooden ware. The total number of manufacturing establishments reported by the census of 1870 was 3,342, using 280 steam engines of 8,787 horse power, and 2,312 water wheels of 68,291 horse power, and employing 40,783 hands, of whom 25,829 were males above 16 years of age, 12,775 females above 15, and 2,179 youth. The total amount of capital employed was \$36,023,743; wages paid, \$13,823,091; value of materials used, \$44,577,967; of products, \$71,038,249. The chief industries are shown by the following statement:

The greater portion of the foreign products consumed in New Hampshire is entered at Boston. Portsmouth, however, is a United States port of entry, where the value of imports during the year ending June 30, 1874, amounted to \$41,388. The exports were unimportant. The number of vessels that entered in the foreign trade was 54 of 9,794 tons, and 62 were cleared. The entries in the coastwise trade comprised 1,032 vessels, of 105,142 tons, including 329, of 10,477 tons, engaged in fisheries. The number of vessels that cleared in the coastwise trade

was 1,032. There were registered, enrolled, and licensed at this port 74, of 14,502 tons, of which 69 were sailing vessels.—The railroads of the state are subject to inspection by three state commissioners, who are required to report annually to the legislature. There were 92 m. of railroad in 1844, 467 in 1850, 661 in 1860, 736 in 1870, and 946 in 1874. The railroads lying wholly or partly in New Hampshire, with their termini and the number of miles completed in the state in 1874, are represented in the following table:

On Nov. 1, 1874, there were 43 national banks in operation, with a paid-in capital of \$5,365,-000 and an outstanding circulation amounting to \$4,707,365, being \$14 79 per capita, 1 per cent. of the wealth of the state, and 87-7 per cent. of the bank capital. In May, 1874, there were 64 savings banks, with 92,788 depositors, and deposits aggregating \$28,829,377. The total liabilities amounted to \$30,333,792; loans, \$15,487,642. The fire insurance companies organized under the laws of the state comprised 16 town companies, 6 mutual not limited to towns, and the New Hampshire joint stock company. The amount of risks carried by the town companies was \$2,241,627, and by the mutual \$12,932,929. There were 56 fire and 5 marine insurance companies of other states and foreign countries licensed to transact business in New Hampshire. The amount of risks assumed by these companies and in force on Jan. 1, 1874, was \$38,535,887; premium receipts in 1873, \$486,679; losses paid, \$403,767. Thirty life insurance companies of other states were transacting business in New Hampshire, and had in force on Jan. 1, 1874, 10,150 policies, insuring \$14,682,950.—The constitution of 1784, amended in 1792, is the fundamental law of the state. The legislature, styled the general court, comprises a senate of 12 members and a house of representatives, the number of which, annually varying, in 1874-'5 was 341. The state is divided into 12 senatorial districts, not according to population as in other states, but according to the direct taxes paid by the different districts. The representatives are apportioned among the towns according to the number of ratable polls. A town having 150 ratable polls may choose one representative, and one additional representative may be chosen for every additional 300 polls. The legislature meets annually on the first Wednesday in June. The governor is advised in his executive duties by a council of five members. The members of the legislature, governor, and councillors are elected annually on the second Tuesday in March. A majority vote is necessary to election. If no candidate for governor receives a majority, that officer is elected by the

* Leased to Eastern of Massachusetts.

legislature. The right of suffrage is extended to every male 21 years old who has resided in the town six months, excepting paupers and persons who at their own request are excused from paying taxes. According to the constitution only Protestants are eligible to the office of governor or as senators or representatives; but this provision is practically obsolete. The selectmen of towns must submit to the inhabitants once in seven years the question of amending the constitution, when if a majority be in favor thereof a convention must be called, and if the amendments are carried by a two-thirds vote when submitted to the people they become law. The secretary, treasurer, state printer, and commissary general are chosen annually by joint ballot of the legislature. The salary of the governor is \$1,000 per annum; secretary, \$800 and fees; treasurer, \$1,800; adjutant general, \$600. Other interests of the state are under the supervision of commissioners of railroads, banks, insurance, and fisheries. All judicial officers, the attorney general, county solicitors, sheriffs, coroners, and registers of probate are appointed by the governor and council; county commissioners, treasurers, and registers of deeds are elected by the people. The judicial power is vested in a superior court of judicature and a circuit court, probate and police courts, and justices of the peace. The superior court consists of a chief, salary \$2,400, and two associate justices, who receive \$2,200 a year each. The circuit court consists of a chief and two associate justices, who receive \$2,200 a year each. Two annual law terms of the superior court are held in Concord, beginning on the first Tuesdays of June and December. At least two trial terms of the circuit court are held annually in each county. Besides appellate jurisdiction of all actions brought in the lower courts, the circuit court has general jurisdiction of all civil and criminal actions at law and equity, and exclusive cognizance of all petitions for divorce. Married women may hold property to their sole and separate use, and may dispose of it by will. New Hampshire is represented in congress by three representatives and two senators, and has therefore five votes in the

electoral college. The total debt of the state on June 1, 1874, was \$3,826,590, all of which is funded and will mature in 31 years in nearly equal annual amounts. The actual revenue and expenses of the state for two years ending May 31 were as follows:

REVENUE.

Excess of revenue over expenses.....	805,570 42

The chief items of expense were as follows: executive department, \$3,130; secretary's, \$2,845; treasury, \$3,023; adjutant general's, \$2,403; public instruction, \$6,964; insurance department, \$877; legislature, \$45,549; supreme judicial court, \$17,980; probate court, \$7,662; state library, \$2,393; compiling provincial records, \$3,674; state house, \$3,804; asylum for insane, \$7,120; education of deaf and dumb, \$3,198; education of blind, \$2,850; reform school, \$8,263; state prison, \$2,467; New Hampshire medical school, \$5,000; normal school, \$5,486; volunteer militia, \$13,767; board of agriculture, \$4,934; mountain roads, \$3,000; geological survey, \$4,525. The total valuation of property in the state, made by the assessors of the several cities and towns for purposes of taxation, was reported at \$103,652,835 in 1850, \$127,018,117 in 1860, \$129,856,167 in 1864, \$149,065,290 in 1868, and \$152,987,177 in 1872. These returns are considered to be very much below the real value, which is estimated at more than \$250,000,000. The true value of real and personal estate was reported by the federal census of 1870 at \$252,624,112, and the assessed value at \$149,065,290, including real estate valued at \$85,231,288 and personal property at \$63,834,002. The state tax is divided among the several cities and towns according to an apportionment made every fourth year, based upon the assessed valuation of the taxable property. The amount varies. Before the war, when the state was without debt, it never exceeded \$70,000 a year; but since 1861 it has been as follows: for 1862, \$80,000; 1863, \$270,000; 1864, \$500,000; 1865 and 1866, \$750,000 each; 1867 and 1868, \$625,000 each; 1869, 1870, and 1871, \$600,000 each; 1872, \$300,000; 1873,

\$600,000; 1874 and 1875, \$400,000 each. Each city and town pays its proportion of this tax directly to the state treasury. Cities and towns also levy a tax for local purposes. The rate of taxation for all purposes varies in the several cities and towns, but is generally from $1\frac{1}{2}$ to $2\frac{1}{2}$ per cent. Railroads are taxed separately, the judges of the superior court fixing "the actual present value of the capital" and assessing it "as near as may be in proportion to the taxation of other property" in the towns where they are situated. The railroads pay these taxes to the state treasurer; and one fourth of the tax of each road is paid by him to the towns through which the road passes, in proportion to the share of its capital therein expended; such portion of the residue to towns where stock is owned as the number of shares owned there bears to the whole number of shares of the road; and the remainder goes to the state. The proportion of this tax to some towns more than pays their state tax. Savings banks pay 1 per cent. on their deposits, which is divided among the towns in proportion to the amount of deposits held by citizens thereof.—New Hampshire has no institution for the blind or the deaf and dumb, but the state in 1874 paid \$2,850 for the education of the former class in the Perkins institute in Boston, and \$3,198 for the education of deaf and dumb at the American asylum in Hartford. The asylum for the insane, opened in 1842, is in Concord. In 1874 the state paid \$6,000 for the support of indigent insane, and \$873 for the convict insane. The number of inmates on April 30, 1874, was 281, while the total number cared for during the year was 416, and the average number was 267. Of the 140 admitted during the year, 109 were supported by themselves or friends. The state prison in Concord was established in 1812, and on May 1, 1874, had 95 inmates. The earnings of the prison for the preceding year amounted to \$23,679, including \$22,106 from the labor of the convicts, and the expenses were \$13,067, leaving a net profit of \$10,612. The average number of working men was 75. The prisoners have the use of a library, and those who on entering cannot read or write are instructed in these branches. The state reform school at Manchester, opened in 1855, had 91 inmates on May 30, 1874; the whole number during the year ending at that date was 149. Boys and girls under 17 years of age are committed for offences against the laws. The ordinary English branches are taught. The chief employments are chair seating and farming. The ordinary expenses for the year were \$22,938; total expenses, \$27,684; total receipts, \$27,167, including \$8,000 from state treasurer, \$6,253 from labor of inmates, and \$10,434 from towns, &c., for board of inmates. At Franklin is the New Hampshire orphans' home school of industry, a corporate institution which was opened in 1871, and is supported by contributions.—The general su-

pervision of education is vested in the superintendent of public instruction, who is appointed by the governor and council for two years, and receives an annual salary of \$1,200 and expenses. The several towns annually choose committees, who superintend the schools, examine teachers, grant certificates, dismiss teachers and pupils when necessary, select text books, determine with the selectmen the location of school houses and change of districts, and make annual reports to the town and state. Prudential committees are annually chosen by the districts, and have general charge of the school houses and the employment of teachers. In 1872 the legislature passed a law making women eligible as members of the town and prudential committees. High schools may be established by vote of the town or by the union of contiguous districts. There is no general state revenue for the maintenance of common schools. Public schools are supported by local taxation of property, each town being required to raise for this purpose \$3 50 for every dollar of its apportionment of the state tax. Towns or districts may vote additional sums for school purposes. There is also a literary fund for the maintenance of public schools, arising from a tax of one half of one per cent. on the capital stock of savings banks. Several towns and districts have permanent local funds for the support of schools. The state provides for the registration of pupils, statistical returns, and annual teachers' institutes in each county. A compulsory educational law was passed in June, 1871, requiring all children between 8 and 14 years of age to attend school at least 12 weeks every year, under penalty of \$10 for the first and \$20 for every subsequent violation of the statute. The progress of the state in respect to public schools during the last decade is as follows:

PARTICULARS.	1863-'4.	1873-'4.
Number of school districts.....	2,328	2,148
" of schools.....	2,487	2,502

Average cost per pupil.....	\$3 13	\$7 05
Estimated total value of school houses	\$916,894	\$2,208,025

The state normal school was opened in 1871 at Plymouth, Grafton co. Up to June, 1874, the legislature had appropriated \$18,000 for perma-

nent improvements, and annual appropriations have been made for current expenses. The institution depends upon these annual appropriations and the proceeds from tuition; the rate per pupil is about \$25 a year. Besides a preparatory course, there are two courses of instruction of one year each. A certificate of graduation from the first entitles the holder to teach in the state three years, and of the second five years. In 1874 there were four instructors in the normal department; the number of graduates from the opening of the school was 102. In 1873 the institutions for secondary instruction were reported as 27 high schools, 17 academies, 5 seminaries for females, and 4 institutes; 37 of these reported an aggregate attendance of 3,685 pupils, including 1,915 females, and 96 teachers, of whom 55 were females. There are three schools devoted chiefly to preparing boys for college, the most noted of which, Phillips academy at Exeter, is described in the article on that town. The other two, St. Paul's school in Concord and Kimball union academy at Meriden, have extended facilities for instruction and a large attendance. The only college in the state is Dartmouth at Hanover, which besides the college proper comprises the Chandler scientific school, the Thayer school of civil engineering, the medical school, and the New Hampshire college of agriculture and mechanic arts. (See DARTMOUTH COLLEGE.) The leading institutions for the superior instruction of females are Adams female academy at East Derry, Robinson female seminary at Exeter (see EXETER), Tilden seminary at West Lebanon, the New Hampshire conference seminary and female college at Tilton, and the New Hampton literary institution at New Hampton. —According to the census of 1870, there were 1,526 libraries in the state, having 704,269 volumes. Of these 856, with 379,876 volumes, were private, and 670, with 324,393 volumes, other than private, including the state library in Concord, with 13,500 volumes; 32 town and city, 44,744; 21 school and college, 30,800; 538 Sabbath school, 164,570; 38 church, 7,425; 4 of historical, literary, and scientific societies, 18,510; and 29 circulating, 47,217. The largest library in the state is that of Dartmouth college, which had 46,000 volumes in 1874. The other chief libraries are the Manchester city library, 20,000 volumes; New Hampshire historical society, Concord, 7,500; Concord city library, 6,400; and the Portsmouth Athenæum, 12,000. The whole number of newspapers and periodicals in 1870 was 51, having an aggregate circulation of 173,919, and issuing annually 7,237,588 copies. There were 7 daily, with a circulation of 6,100; 37 weekly, 75,819; and 1 semi-monthly, 67,000. In 1874 the whole number reported was 60, including 9 daily, 44 weekly, 6 monthly, and 1 quarterly. The total number of religious organizations in 1870 was 633, having 624 edifices with 210,090 sittings and property valued at \$3,303,780. The leading denominations were as follows:

DENOMINATIONS.	Organi- zations.	Edifices.	Sittings.	Property.
Baptist, regular.....	102	90	31,935	\$492,200

—New Hampshire was first visited by Europeans in 1614, and the first settlements were made at Dover and Portsmouth in 1623. In 1641 the district was annexed to Massachusetts; it was made a royal province in 1679, but was again joined to Massachusetts in 1689. In 1741 it became a separate province, and remained so till the revolution. The early settlers were greatly annoyed by the Indians until after the English got possession of Canada. In 1689, in revenge for some injuries done them 13 years before, a party of Indians attacked Dover, killed many of the inhabitants, and burned several houses. The settlements of New Hampshire were gradually extended further W. than the original limits prescribed by the grant to John Mason in 1629, and it was supposed till 1764 that the territory at present included in Vermont formed part of the province, and grants of land were made in that direction by the authorities. The disputed district was claimed by New York, and a vexatious controversy ensued, which lasted till the independence of Vermont was acknowledged in 1790. In 1776 New Hampshire made a public declaration of independence, and established a temporary government to continue during the war. The state took an active part in the war of independence, and the men of New Hampshire were engaged on every battle field from Bunker hill to the surrender of Cornwallis. At the battles of Bennington, Stillwater, Saratoga, and Monmouth they were particularly distinguished for their bravery. On June 21, 1788, the state in convention ratified the constitution of the United States, 57 votes being cast for and 46 against it. On June 12, 1781, a convention assembled and prepared a constitution very similar to that which had been recently adopted in Massachusetts. After numerous alterations suggested by the people, the instrument went into force June 2, 1784. Pursuant to its provision for submitting the question of amending it to a vote at septennial periods, a convention assembled in Concord, Sept. 7, 1791, and adopted amendments, which were approved by the people and went into force in September, 1792. This constitution has since continued the supreme law of the state. In 1849 another convention was called,

which sat in Concord from Nov. 6, 1850, to April 17, 1851, and proposed numerous amendments; but only one was adopted, removing the property qualification of representatives. In 1807 the seat of government was permanently established at Concord. The aggregate number of troops furnished to the federal army by New Hampshire during the civil war was 34,605, or, reduced to a three years' standard, 30,827. The geological survey of New Hampshire has now (1875) been in progress six years, under charge of the state geologist, Prof. Charles H. Hitchcock. Five brief annual reports have been made, and the first volume of the final report was published in 1875. It is devoted to physical geography, and treats among other things of climatology, topography, altitudes, river systems, distribution of animals (particularly insects) and plants, agricultural geology, scenery, &c. Prof. Hitchcock has drawn a new map of the state, 2½ m. to the inch. (See supplement.)

NEW HANOVER, a S. E. county of North Carolina, bordering on the Atlantic and bounded W. by the Cape Fear river and one of its branches; area, about 1,000 sq. m.; pop. in 1870, 27,978, of whom 16,199 were colored. It has a level surface, with occasional swamps, and a not very fertile soil, and contains large forests of pine. Several railroads terminate at Wilmington. The chief productions in 1870 were 133,176 bushels of Indian corn, 88,892 of peas and beans, 94,713 of sweet potatoes, 398,925 lbs. of rice, 11,629 of wool, 29,950 of honey, and 4,622 gallons of wine. There were 633 horses, 410 mules and asses, 2,456 milch cows, 4,688 other cattle, 3,736 sheep, and 14,712 swine; 3 manufactories of carriages and wagons, 2 of railroad cars, 5 of cooperage, 1 of fertilizers, 2 of iron castings, 3 of machinery, 8 of tar and turpentine, 3 flour mills, 12 saw mills, and 1 ship yard. Capital, Wilmington.

NEW HARMONY, a town of Posey co., Indiana, on the Wabash river, 50 m. from its mouth, and 150 m. S. W. of Indianapolis; pop. in 1870, 836. It was built by the Harmonists under George Rapp in 1815, and purchased from them in 1824 by Robert Owen for the purpose of testing his social system, an experiment which resulted unsuccessfully. Mr. Owen sold a large portion to William Maclure, who there established a school of industry, which after a trial of about six years was abandoned.

NEW HAVEN, a S. county of Connecticut, on Long Island sound, bounded W. by the Housatonic river, and drained by the Naugatuck, Quinepiack, and other streams; area, 640 sq. m.; pop. in 1870, 121,257. The surface is generally uneven, mountainous in the middle and toward the east, and the soil is moderately fertile. On the coast there are several excellent harbors. It is intersected by several railroads, centring in New Haven. The chief productions in 1870 were 4,358 bushels of wheat, 56,868 of rye, 234,331 of Indian corn, 106,872 of oats, 17,039 of buckwheat, 511,009 of pota-

toes, 73,971 tons of hay, 103,562 lbs. of tobacco, 24,751 of wool, and 804,246 of butter. There were on farms 4,752 horses, 10,841 milch cows, 5,050 working oxen, 9,203 other cattle, 8,591 sheep, and 6,648 swine. There were 940 manufacturing establishments, with a capital of \$29,445,641, and annual products valued at \$45,156,181. The most important were 62 manufacturing of carriages and wagons, 5 of clocks, 18 of cutlery and edge tools, 55 of hardware, 10 of hoop skirts and corsets, 7 of India-rubber and elastic goods, 6 of forged and rolled iron, 25 of castings, 22 of machinery, 14 of plated ware, 1 of straw goods, 24 of tin, copper, and sheet-iron ware, 10 of woollen goods, and 17 saw mills. Capital, New Haven.

NEW HAVEN, a town, city, and port of entry of New Haven co., Connecticut, capital of the county and the largest city in the state, situated at the head of New Haven bay or harbor, 4 m. from Long Island sound, 33 m. S. S. W.

of Hartford, and 65 m. E. N. E. of New York; lat. $41^{\circ} 18' 23''$ N., lon. $72^{\circ} 56' 30''$ W.; pop. in 1810, 5,772; in 1820, 7,147; in 1830, 10,180; in 1840, 12,960; in 1850, 20,345; in 1860, 39,267; in 1870, 50,840, of whom 14,356 were foreigners. The number of families was 10,482; of dwellings, 8,100. The city stands on a plain about 2 m. wide, and is nearly surrounded by hills, from which delightful views may be obtained. Chapel street, the principal thoroughfare, extends in a W. N. W. direction throughout the length of the city. The dwelling houses are generally neatly built and surrounded by gardens, and many of them are almost hidden from view among trees. The number of magnificent elms with which the principal avenues are planted has caused New Haven to be called "the city of elms." They were mostly set out about the close of the 18th century by James Hillhouse, or through his influence and example. Of several public squares which adorn

New Haven, from Fort Hill.

the city, the principal are Wooster square, an enclosure of 5 acres in the E. part, laid out with remarkable elegance and good taste, and the "Green," 16 acres in extent, and shaded by beautiful elms. Hamilton park, a private ground, adjoining West river and Westville, comprises 55 acres. Works supply the city with water from Mill river, which flows through the E. part. Of the public buildings, the first in point of interest are those connected with Yale college. (See YALE COLLEGE.) The custom house, on Church street, is of Portland stone, and has apartments for the post office and United States courts. The state house, court house, city hall, hospital, medical college, orphan asylum, and almshouse are the principal other buildings. The New Haven burying ground, containing 18 acres, N. W. of the city, is beautifully laid out. The Evergreen cemetery, on West river, is large and tastefully adorned, and near it is a Catholic burying ground. There are several horse railroads. New Haven has

communication with New York and the principal points in New England by the following railroads: New York, New Haven, and Hartford; New Haven, New London, and Stonington; New Haven, Middletown, and Willimantic; New Haven and Northampton; and New Haven and Derby. It has regular communication with New York by steamboats.—The harbor of New Haven is shallow, and has extensive oyster beds; and the main channel from the junction of Quinepiack and Mill rivers is somewhat circuitous, and not of sufficient depth for large vessels. To meet the channel from the business part of the city two wharves, 3,500 and 1,500 ft. long, have been built, and there are other landings for steamboats. Operations for improving the harbor are in progress. Apart from the coasting trade, the chief commerce is with the West Indies, which the United States commercial reports do not fully exhibit, as much of the business of New Haven merchants is done through New York. There is also a

growing commerce with Europe. The value of imports during the year ending June 30, 1874, was \$1,066,174; of exports, \$592,903; entrances in the foreign trade, 95, tonnage 19,560; clearances, 51, 7,720; vessels belonging in the district, 167, 21,051, viz.: 142 sailing vessels, 13,499; 12 steamers, 4,900; and 13 unrigged craft, 2,652. There are 550 to 650 coastwise entrances and clearances annually. A capital of about \$10,000,000 is invested in manufactures. Clocks are made here very extensively, and are exported to the most distant countries. Carriage making is more largely carried on than in any other part of New England. Iron working, particularly in the lighter and more valuable products of that metal, and the manufacture of India-rubber goods, are prominent industries. Among the other productions are hay cutters, scales, boilers, brass ware, buttons, cars; coach lamps, lace, and trimmings; coffee pots, cutlery, files, fish hooks, needles, firearms, harnesses and saddles, ivory, jewelry, organs, melodeons, pianos, paper, pins, saws, corsets, shirts, and spectacles. There are nine banks of deposit, with an aggregate capital of \$4,664,000; a trust company, with \$100,000 capital; four savings banks, with deposits amounting to \$10,070,693; and two insurance companies, with a joint capital of \$300,000.—The city is divided into ten wards, and is governed by a mayor and a board of aldermen of two and a council of three members from each ward. There are efficient fire and police departments. The streets are well paved, drained, and lighted with gas. The principal charitable organizations are the home for aged and destitute women, the home for the friendless, and two orphan asylums. The valuation of property in 1873 was \$56,556,179; revenue, \$807,421; expenditures, \$726,910 90; city debt, \$790,000. The public schools, besides a high, grammar, and primary schools, embrace two training schools for teachers, two truant schools for boys, two ungraded schools for neglected children, and evening schools for both sexes. The number of school houses occupied in 1873 was 24; number of rooms, 155; number of sittings, 8,151; teachers employed, 200; pupils enrolled, 8,807; average attendance, 6,850. The Hopkins grammar school, an incorporated institution established in 1660, is chiefly designed for preparing boys for Yale college. There are also a collegiate and commercial institute, and more than 20 private schools. The city has five daily, one semi-weekly, and nine weekly newspapers, and four monthly and one quarterly periodicals. The number of churches is 51, viz.: Baptist, 5; Congregational, 13; Episcopal, 10; Jewish, 2; Lutheran, 1; Methodist, 11; Roman Catholic, 7; Second Advent, 1; Universalist, 1.—New Haven was settled in 1638 by a company chiefly from London under Theophilus Eaton, their first governor, and the Rev. John Davenport. It was a distinct colony till 1665, when after a protracted struggle it

was united with Connecticut under the charter of 1662. It was incorporated as a city in 1784. From 1701 to 1875 New Haven was one of the state capitals. (See HARTFORD, vol. viii., p. 489.)

NEW HEBRIDES, a group of volcanic islands in the S. Pacific ocean, N. E. of New Caledonia, between lat. 13° 15' and 20° 10' S., and lon. 166° 30' and 170° 10' E.; area, about 5,700 sq. m.; pop. about 134,000. Besides a great number of islets and rocks, they comprise about 20 islands of considerable size, the most important of which are Espiritu Santo, 70 m. long by about 25 m. broad; Mallicollo, 60 by 28 m., with a good harbor called Port Sandwich, in lat. 16° 25' S., lon. 167° 46' E.; Erromango, Tanna, Ambrim, Annatom, Banks, Sandwich, and Whitsuntide. Aurora, one of the most fertile of the group, said to have been 36 m. long by more than 5 m. broad, disappeared in 1871, leaving no trace of its existence. There is an active volcano in Tanna. Most of the islands are hilly, and there are high mountains. With the exception of Erromango and some smaller ones, they are all well wooded and supplied with good water, and present a luxuriant vegetation. Sandal wood and ebony are found. Yams, taro, shaddocks, bananas, limes, cucumbers, cocoanuts, and a species of sweet potato are cultivated. There are few animals; the most remarkable is a diminutive species of hog, which when full-grown is not larger than a rabbit. The natives, of the Papuan negro race, are less intelligent than the other South sea islanders, and are accused of cannibalism. Their habits are disgusting, their persons filthy, and their faces smeared with turmeric and charcoal. The use of betel nut and chunam is general; and the language is said to possess a similarity to the Malay. They have no canoes, and use a sort of raft, on which they only venture a few hundred yards from the shore.—The group was discovered by Quiros in 1606; but he only saw the N. and largest island, and supposing it to be a portion of the long-sought southern continent, he named it Australia del Espiritu Santo. He speaks of it as one land, and made no attempt to verify his conjecture. Bougainville, more than a century and a half later, ascertained that the N. portion consisted of several islands, which he called the Great Cyclades. Cook discovered the greater part of the S. chain in 1773, and called the whole group the New Hebrides; and as his discovery much exceeded in extent those previously made, this name has superseded that applied by Bougainville. Erromango, one of the most southerly islands, was the scene of the murder of the well known missionary the Rev. John Williams (Nov. 20, 1839).

NEW HOLLAND. See AUSTRALIA.

NEW IRELAND, an island in the S. Pacific ocean, between lat. 2° and 5° S., and lon. 150° 30' and 153° E. It is separated from New Britain on the southwest by St. George's channel, and from New Hanover on the northwest by

Byron's straits; length about 200 m., average breadth 20 m.; area, about 4,300 sq. m.; pop. about 11,000. The hills rise to the height of 1,500 or 2,000 ft., and are clothed from base to summit with the most luxuriant forests. The highest peaks are known as "Mother and Daughter." The timber grows to a great height, many of the trees being 80 or 90 ft., perfectly straight, and 9 ft. in circumference. The indentations of the coast offer several very commodious harbors. The lower tracts are well cultivated, and produce sugar cane, bananas, cocoanuts, yams, and numerous other plants and trees. The inhabitants belong to the Australian negro race, and their villages are very neat. Their canoes are well built, but not large. Dogs, pigs, and turtles are the chief animals. The islanders trade in fancy woods and tortoise shell, the latter of superior quality.

NEW JERSEY, one of the thirteen original states of the American Union, situated between lat. 38° 56' and 41° 21' N., and lon. 73° 54' and 75° 33' W.; extreme length 167 m., average breadth 50 m.; area, 8,320 sq. m. It is bounded N. E. by New York; E. by the Hudson river, which separates it from New York, by New York bay, and the Atlantic ocean; S. by the Atlantic and by Delaware bay; and W. by Del-

State Seal of New Jersey.

aware and Pennsylvania, from which it is separated by the Delaware river. The state is divided into 21 counties, viz.: Atlantic, Bergen, Burlington, Camden, Cape May, Cumberland, Essex, Gloucester, Hudson, Hunterdon, Mercer, Middlesex, Monmouth, Morris, Ocean, Passaic, Salem, Somerset, Sussex, Union, and Warren. The cities, according to the census of 1870, are: Bridgeton, pop. 6,830; Burlington, 5,817; Camden, 20,045; Elizabeth, 20,832; Harrison, 4,129; Hoboken, 20,297; Jersey City, 82,546; Millville, 6,101; Newark, 105,059; New Brunswick, 15,058; Orange, 9,348; Paterson, 33,579; Plainfield, 5,095; Rahway, 6,258; Salem, 4,555; and Trenton, the capital, 22,874. The population of the state and its rank in the Union, according to the federal enumerations, have been:

YEARS.	White.	Free colored.	Slaves.	Total.	Rank.
1790.....	169,954	2,762	11,423	184,139	9
1800.....	194,325	4,402	12,422	211,149	10
1810.....	226,868	7,843	10,551	245,562	12
1820.....	257,409	12,460	7,557	277,426	13
1830.....	300,266	18,303	2,254	320,823	14
1840.....	351,588	21,044	674	373,306	13
1850.....	465,509	23,810	236	489,555	19
1860.....	646,689	25,318	18	672,035	21
1870.....	875,407	30,658	906,096	17

Of the total population in 1870, which included 16 Indians and 15 Chinese and Japanese, 449,672 were males and 456,424 females; 717,153 were native born, of whom 575,245 were born in the state, 74,750 in New York, and 32,947 in Pennsylvania; 188,943 were foreigners, including 54,001 born in Germany, 3,130 in France, 26,614 in England, 86,784 in Ireland, and 5,704 in Scotland. The density of the population was 108.91 to the square mile. There were 183,043 families, with an average of 4.95 persons to each, and 155,936 dwellings, with an average of 5.81 to each. The increase of population from 1860 to 1870 was 34.83 per cent. The number of male citizens 21 years old and upward was 194,109; of persons from 5 to 18 years of age, 262,862; attending school, 158,099. There were 37,057 persons 10 years old and upward unable to read, and 54,687 who could not write; of the latter, 29,726 were of native and 24,961 of foreign birth; 42,821 were 21 years of age and over, of whom 36,431 were white and 6,390 colored, 17,396 males and 25,425 females. The number of paupers supported during the year ending June 1, 1870, was 3,356, at a cost of \$283,341. Of the total number (2,390) receiving support June 1, 1870, 1,669 were of native birth, including 301 colored, and 721 were foreigners. The number of persons convicted of crime during the year was 1,040; in prison June 1, 1870, 1,079, of whom 640 (including 157 colored) were natives, and 439 foreigners. There were 317 blind, 231 deaf and dumb, 918 insane, and 436 idiotic. Of the total population 10 years of age and over (680,687), there were engaged in all occupations 296,036; in agriculture, 63,128, of whom 29,240 were laborers and 32,077 farmers and planters; in professional and personal services, 83,380, including 1,236 clergymen, 26,242 domestic servants, 232 journalists, 39,820 laborers not specified, 888 lawyers, 1,208 physicians and surgeons, and 2,098 teachers not specified; in trade and transportation, 46,206; and in manufactures, mechanical and mining industries, 103,322, of whom 3,823 were blacksmiths, 5,349 boot and shoe makers, and 12,569 carpenters and joiners. The number of deaths was 10,586, or 1.17 per cent. of the population. There were 1,822 deaths from consumption, or 5.8 deaths from all causes to one from that disease; from pneumonia 700, or 15.1 from all causes to one from that disease; from cholera infantum, 783; croup, 215; diphtheria, 177; scar-

UNIVERSITY OF ILLINOIS

let fever, 781; enteric fever, 336; diarrhœa, dysentery, and enteritis, 552. In 1873 the state authorities reported 6,636 marriages, 20,866 births, and 11,479 deaths, including 1,502 from consumption and 638 from cholera infantum.—New Jersey has a direct coast line of 120 m., exclusive of the coasts on the Raritan and Delaware bays; but including smaller bays, islands, and tide-water creeks, this shore line is much longer. On the northeast the Hudson river, and New York, Newark, and Raritan bays, afford good harbors. From Sandy Hook to Cape May there is a narrow sandy beach, intersected at a few points by narrow inlets, and separated from the mainland by long and narrow bays and tide meadows traversed by numerous tidal watercourses, called thoroughfares. These bodies of water form an internal water route, and afford safe harbors for vessels of light draught. They communicate with the ocean through Manasquan, Barnegat, Little Egg harbor, Great Egg harbor, and other inlets. On the Delaware bay there is a belt of tide meadow from 1 to 12 m. wide bordering the water, with no good harbors. The state is well watered by a river system which flows E. into the bays and the Atlantic ocean and W. into the Delaware river and bay. A small portion of the state is drained by the Wallkill, which runs N. E. to the Hudson river. The Hackensack and Passaic rivers empty into the northern end of Newark bay; the Raritan, into Raritan bay; the Nevisink, into Sandy Hook bay; and the Little Egg Harbor or Mullicas river and the Great Egg Harbor river, into the Atlantic. Maurice river, emptying into Delaware bay, is the largest stream of S. Jersey. These are all navigable for distances of 10 to 20 m. from their mouth. The Delaware receives a number of streams from 10 to 40 m. long, but none of them above Trenton are navigable.—The surface of the state in the N. W. portion is mountainous; in the N. E. and central portions, hilly; in the southern, low and gently undulating. The mountains in the north belong to the Appalachian system, and consist of two main ranges: the Blue or Kittatinny mountain, near the Delaware river, known in New York as the Shawangunk mountain, and the Highland range. These are separated by a valley about 10 m. wide, known as the Kittatinny valley. The Highland range consists of a series of parallel ridges whose heights vary from 1,000 to 1,450 ft. above tide water. The most prominent of these are the Ramapo, Trowbridge, Wawayanda, Hamburg, Schooley's, Musconetcong, Scott's, and Jenny Jump mountains. The Blue mountain range, the highest in the state, is from 1,400 to 1,800 ft. above the ocean. The N. E. and central portions of the state consist of a great plain, diversified by the trap ridges of the Palisades including First and Second mountains, Sourland mountain, and Rocky hill, from 300 to 600 ft. high. S. E. of a line connecting Amboy and Trenton the sur-

face is lower and the hills slope more gently. The Nevisink Highlands are the highest, being 375 ft. above the ocean. Very few other elevations in this part of the state exceed 200 ft.—All of the great geological periods are represented in New Jersey, excepting the carboniferous or coal and the Jurassic. The rock formations cross the state in belts from N. E. to S. W. The oldest of these, known as the azoic or archaic formation, constitutes a broad belt forming the Highlands. On the line between New Jersey and New York it is 23 m. wide, stretching from Sufferns to the Wallkill river; on the Delaware it is only 9 m. in breadth. There is also a small outcrop of the rocks of this formation near Trenton; they extend N. E. from Trenton, along the N. side of the canal, about 6 m., and northward along the Delaware about 2 m. A very limited area of these rocks underlies Jersey City. The rocks of this formation are nearly everywhere stratified, and these strata have a strike of N. E. to S. W., and dip generally at a high angle toward the southeast. They are mainly gneiss, crystalline limestone, mica schist and slate, granite, and syenite. The syenitic gneiss greatly preponderates. No fossils are found in them. Near the surface in the S. W. portion of this belt these rocks are much disintegrated, forming a very superior and enduring soil. Toward the northeast they are much firmer, and the outcropping ledges show little change or weathering. The granite and gneiss make good building material, and they are quarried in a few places for this purpose. Magnetic iron ore occurs abundantly in this formation, in beds interposed between the gneissic strata, and also as a mineral component of the rocks. There is a large number of productive mines in this belt in Sussex, Passaic, Morris, and Warren counties; their total product in 1873 amounted to 665,000 tons. About one fifth of the production is annually worked up in the blast furnaces at Ringwood, Boonton, Stanhope, Oxford Furnace, and Phillipsburg, in the state; but the greater portion goes to the anthracite furnaces of Pennsylvania. In the white, crystalline limestone at Ogdensburg and Franklin, in Sussex co., there are large beds of zinc ore associated with franklinite, supplying the extensive zinc works at Newark and Jersey City. Northwest of the azoic formation, and occupying some of the valleys in the Highlands, are the rocks of the Silurian and Devonian epochs. The most extensive of these is the magnesian limestone, a blue sedimentary rock seen in the Kittatinny, German, Musconetcong, Pohatcong, and Wallkill valleys, and to a less extent in a few other localities. Its stone is largely used for building and in the manufacture of lime. Hematite ore, of which there are about a dozen mines, occurs in it. The lowest member in the Silurian system is the conglomerate and sandstone, which makes up the Bearfort or Rough, Greenpond, and Copperas mountains, and other lower ridges, and the thin belt of gray sandstone found be-

tween the gneissic rocks and the magnesian limestone. The latter, known as the Potsdam sandstone, crops out at Franklin and Vernon in Sussex co., and at Oxford Furnace and other points in Warren co. The third member in this system, ascending, is the Hudson river slate, which has an extensive outcrop in the Kittatinny valley, and forms the E. slope of the Blue or Kittatinny mountain. It shows nearly everywhere its tendency to cleavage, and it is quarried at the Delaware Water Gap and at Newton for roofing slate. Some of the thicker and more arenaceous beds are used for flagging stone. In the Blue mountain the gray conglomerate, the equivalent of the Oneida conglomerate, has a wide and unbroken outcrop from the Delaware river to the New York line. Overlying it, and forming the western and lower slope of the Blue mountain, is the Medina sandstone; the rocks are red sandstones and shales, and a few vegetable forms are occasionally seen in them. West of this, and occupying the narrow valley of the Delaware, are several formations or members of the Silurian and Devonian epochs. Southeast of the Highlands there is a wide belt of red shales and sandstones of the triassic period. This occupies a large part of Bergen, Passaic, Essex, Union, Somerset, Hunterdon, Middlesex, and Mercer counties, and is 30 m. wide on the Delaware river. The rocks are red argillaceous shales and sandstone, with a few limited outcrops of calcareous and silicious conglomerates on the N. W. border, near the azoic rocks. Within the limits of this formation there are several long outcrops of trap rock lying between beds of shale and sandstone, forming the well known Palisades, First and Second mountains, Pickles mountain, Sourland mountain, Rocky hill, and others. Narrow dikes of trap are also known. The sandstone is extensively quarried for building at Paterson, Little Falls, Newark, Trenton, Centre Bridge, and in other places. Fossil fish have been found in the rocks of this formation at Pompton, Boonton, and near Somerville. Fossil plants are more common. Copper ores and native copper are common in the altered sandstone near the junction of the trap rocks, occurring irregularly disseminated through the sandstone, and not in veins or beds. Several copper mines were early opened, but none of them are now in operation. The next formation S. E. of the triassic rocks is the plastic clay series belonging to the cretaceous period. In this are the valuable beds of fire clay and potter's clay which are so largely dug in the vicinity of Woodbridge and Amboy, and near Trenton. Fossil wood and leaf prints with a few cretaceous shells are found in this series. This belt follows the Delaware from Trenton S. W. to Salem. The next geological formation on the southeast is the clay marl, occupying a narrow belt entirely across the state. The beds are mainly astringent clays containing a small percentage of greensand. The next belt S. E.

is that of the greensand marl beds, stretching from Sandy Hook to Salem. There are three beds, separated by beds of sand, dipping gently toward the southeast. They are characterized by the mineral glauconite or greensand which makes up most of their mass. (See GREENSAND.) Generally there is some carbonate and some phosphate of lime in these beds, and hence the value of this marl as a fertilizer. Many fossils characterize these beds and help to fix their geological age. The S. E. portion of the state is supposed to belong to the tertiary age. There are beds of calcareous marl near Shiloh, Cumberland co., which are undoubtedly miocene, and are very full of shells. Beds of glass sand, which are extensively worked, occur along Maurice river near Millville, at Winslow, Jackson, and other places. The higher grounds in this part of the state are gravelly, and probably belong to the modified drift. Bog ore is found in many places, generally under the peat or mud of wet meadows. The drift period is represented nearly everywhere throughout the state in the superficial beds of sand, gravel, and boulders. These beds are thicker and the boulders are larger in the northern than in the southern part of the state. The smoothed, polished, and striated rock surfaces so common on the harder rocks also represent this period. Alluvial beds are found in isolated patches, sometimes of great extent, as in the wet meadows along the Paulinskill, Pequest, and Passaic rivers. Peat bogs are also common, although they are not generally of great area. Under some of these, in the limestone districts of Sussex and Warren counties, there are beds of calcareous or shell marl a few feet thick. There are extensive tide meadows bordering the tide waters, from 5 to 10 ft. above low-water level, and still in process of formation. Along the Atlantic coast there is a long line of sand beach, which is geologically a long dune, constantly changing in location, extent, and form. These belong to the present or historic period.—New Jersey offers numerous attractions to travellers, among which are the falls of the Passaic at Paterson; the passage of the Delaware through the Blue mountains, called the Delaware Water Gap; the well known bathing places of Cape May, Long Branch, Deal, Squan beach, Atlantic City, and Tuckerton; Schooley's mountain in Morris co., with a mineral spring on its summit; Lake Hopatcong, Greenwood and Budd's lakes, and other points in the northern highlands. The climate varies much in different parts of the state. In the north, where the country is more elevated, it is much colder than toward the south, where the influence of the ocean and a low situation is felt. The annual mean temperature of the southern end of the state is between 53° and 54°; that of the northern end from 48° to 50°. The annual rainfall is about 44 inches; annual mean barometer, 30. Fevers and ague prevail in the neighborhood of the marshes, but upon the seashore and in the

hilly regions the climate is remarkably healthy. The soil is productive, though of varied character. That of the northern part of the state, including the Kittatinny valley, is characterized by its abundant crops of grain and grass, and rich pasturage. The middle portion of the state, which is the most thickly settled, has been enriched by the judicious use of lime, greensand mark, and other fertilizers, and yields abundant farm crops, market garden products, fruit, &c. The southern part of the state has a light soil, and has been but partially cleared. The nearness of New Jersey to the great markets of New York and Philadelphia has stimulated its farmers to improve their soil. The strip bordering on the Delaware from Trenton to Salem is probably the most skilfully cultivated and productive land in the United States.—The vegetation presents no remarkable features, being similar to that of the central states generally. In the north are found the oak, hickory, and other forest trees, and in the south are valuable pine woods, cedar swamps, and a considerable growth of stunted oaks. The central region is the most thoroughly improved part of the state, and forms a vast market garden from which New York and Philadelphia are in large part supplied. The apples and cider of this locality are famous, and the peaches of the more southerly section are excellent and abundant. Muskmelons, watermelons, sweet potatoes, Irish potatoes, Indian corn, wheat, rye, oats, hay, flax, grass seed, plums, apricots, and cherries are raised; honey, beeswax, and butter are made; and there is also a limited production of barley, tobacco, wine, silk, maple sugar, and hops. Several of the native wild animals, such as the fox, bear, and deer, are still seen in the forests. The total number of farms in 1870 was 30,652, of which 2,993 contained from 3 to 10 acres, 3,476 from 10 to 20, 7,376 from 20 to 50, 9,415 from 50 to 100, 7,299 from 100 to 500, 15 from 500 to 1,000, and 8 over 1,000. The average size was 98 acres. The land in farms was 1,976,474 acres of improved and 1,013,037 of unimproved, including 718,335 of woodland; the percentage of unimproved land to the total in farms was 33.9. The cash value of farms was \$257,523,376; farming implements and machinery, \$7,887,991; wages paid during the year, including value of board, \$8,314,548; estimated value of all farm productions, including betterments and additions to stock, \$42,725,198; orchard products, \$1,295,282; products of market gardens, \$2,978,250; forest products, \$352,704; value of home manufactures, \$144,016; of animals slaughtered or sold for slaughter, \$6,982,152. The productions were 2,099 bushels of spring and 2,299,334 of winter wheat, 566,775 of rye, 8,745,384 of Indian corn, 4,009,830 of oats, 8,283 of barley, 363,983 of buckwheat, 56,221 of peas and beans, 47,05,439 of Irish and 1,550,784 of sweet potatoes, 26,306 of clover and 72,401 of grass seed, 6,095 of flax seed,

521,975 tons of hay, 40,871 lbs. of tobacco, 336,609 of wool, 8,266,023 of butter, 38,229 of cheese, 19,033 of hops, 234,061 of flax, 60,636 of honey, 2,021 of wax, 5,373,323 gallons of milk sold, 24,970 of wine, and 17,424 of sorghum molasses. The total value of all live stock was \$21,443,463. There were on farms 79,708 horses, 8,853 mules and asses, 133,331 milch cows, 3,830 working oxen, 60,327 other cattle, 120,067 sheep, and 142,563 swine. The staple crops of 1873 were reported as follows:

CROPS.	Bushels.	Yield per acre.	Acres.	Total value.
Indian corn.....	10,442,000	36	290,055	\$6,474,040
Wheat.....	1,948,000	16.2	120,247	8,214,200
Rye.....	485,000	14.1	34,397	412,250
Oats.....	2,737,000	26.5	103,283	1,841,130
Barley.....	7,200	24	300	7,920
Buckwheat.....	288,000	16.5	17,454	276,480
Potatoes.....	3,560,000	90	39,555	2,885,200
Hay.....	Tons. 416,300	1.03	404,175	10,199,350

The total value of these crops was \$24,310,580. The number and value of domestic animals in 1874 were reported as follows:

ANIMALS.	Number.	Average price.	Total value.
Horses.....	115,700	\$132 08	\$15,281,656
Mules.....	15,000	146 65	2,199,750
Oxen and other cattle...	88,900	33 86	2,940,854
Milch cows.....	147,900	45 75	6,766,425
Sheep.....	125,900	5 14	647,126
Swine.....	168,000	10 29	1,677,270
Total.....	651,400	\$29,413,081

It is estimated that more than half of all the cranberries produced in the United States are grown in New Jersey. In 1873 it was reported that 7,000 acres of cultivated and 10,000 of wild land were devoted to cranberries, and that the crop amounted to about 125,000 bushels, worth from \$2 50 to \$2 75 per bushel. The chief cranberry counties are Ocean, Atlantic, and Burlington.—The abundant water power of New Jersey, and its facilities of communication with the great commercial cities of the Union by railroads, canals, and rivers, have greatly developed its manufactures. In 1860 the amount of capital invested in manufactures was \$40,521,048, and the value of products \$76,306,104. In 1870 the state ranked seventh in the value of productions, and eighth in the extent of capital invested; next to New York in the production of hats and caps, next to Connecticut in India-rubber goods, next to Pennsylvania in steel, and next to New York and Pennsylvania in refined sugar and molasses. In the manufacture of silk goods and trunks New Jersey ranked above all other states. Of the total value (\$7,755,488) of all the trunks, satchels, and valises manufactured in the United States, \$3,793,000 were produced in New Jersey. The total number of manufacturing establishments reported by the census

of 1870 was 6,636, using 984 steam engines of 32,307 horse power, and 1,132 water wheels of 25,832 horse power, and employing 75,552 hands, of whom 58,115 were males above 16, 11,198 females above 15, and 6,239 youth.

The capital invested in manufactures was \$79,-606,719; wages paid, \$32,648,409; value of materials, \$103,415,245; of products, \$169,-237,732. The statistics of the leading industries were as follows:

INDUSTRIES.	No. of establishments.	Steam engines, horse power.	Water wheels, horse power.	Number of hands.	Capital.	Wages paid.	Value of materials.	Value of products.

The mining interests of New Jersey are important. The number of establishments in 1870 was 49; capital, \$2,501,700; annual productions, \$2,554,475, including iron ore valued at \$2,025,497, slate \$17,338, stone \$411,640, and zinc \$100,000. The products of mines, quarries, and clay banks in 1873 were valued at \$5,000,-000. The fisheries in the neighboring waters are a source of great profit, only five other states exceeding it in this respect according to the census of 1870. There were 947 hands and \$231,231 employed, and the total value of products was \$374,912, including oysters valued at \$152,350.—New Jersey is divided into six customs districts, of which the ports of entry are Newark, Perth Amboy, Tuckerton (district of Little Egg Harbor), Great Egg Harbor, Bridgeton, and Lambertton (district of Burlington). The direct foreign trade is carried on chiefly at Newark, where during the year ending June

30, 1874, the imports amounted to \$10,403 and the domestic exports to \$8,387, and Perth Amboy, where the imports were \$35,458 and the exports \$5,747. A portion of the northern part of the state is in the district of New York, and much of the foreign trade passes through Philadelphia. The movement of vessels in the coastwise trade, and the number registered, enrolled, and licensed, were as follows:

DISTRICTS.	ENTERED.		CLEARED.		REGISTER'D, &c.	
	No.	Tons.	No.	Tons.	No.	Tons.

Ship building is carried on in all of these districts, there having been 75 vessels of 8,302 tons built in 1873.—By the free railroad law passed in April, 1873, monopoly is abolished, and railroads may now be built in all parts of the state under a general law. Among

the states, only Massachusetts and Connecticut have more railroads in proportion to territory than New Jersey. This state had 186 m. in 1845, 466 in 1855, 864 in 1865, 1,125 in 1870, and 1,267 in 1874. The different lines in operation in 1874, with their termini and lengths, were:

The Morris canal extends from Jersey City to Phillipsburg, 101 m., and has a large business in conveying coal from Pennsylvania to New York. The Delaware and Raritan canal connects Trenton on the Delaware with New Brunswick on the Raritan, 43 m., and has a feeder 22 m. long, from Bull's Island (Delaware river) to Trenton. In 1874 the state contained 62 national banks, with a paid-in capital of \$13,908,350 and an outstanding circulation of \$11,092,810, being \$12 24 per capita, 1·1 per cent. of the wealth of the state, and 79·8 per cent. of the bank capital.—The

present constitution of New Jersey was adopted in August, 1844, and came into operation Sept. 2. It secures the right of voting to every white male citizen of the United States 21 years of age, who has resided in the state one year and in the county five months next preceding the election. The general election is held annually on the first Tuesday after the first Monday in November, and all votes are taken by ballot. The legislature consists of a senate of 21 members, one from each county, elected for three years, one third every year, and an assembly of 60 representatives elected

annually. The legislature meets annually on the second Tuesday in January. A majority of each house is sufficient to pass a bill over the governor's veto. The chief executive officers are the governor (salary \$5,000), elected by the people for three years; secretary of state (salary \$200 and fees), appointed by the governor with the advice of the senate, and *ex officio* auditor of accounts; treasurer (salary \$4,000), elected by the legislature on joint ballot for one year; comptroller (salary \$4,000); and the superintendent of schools (salary \$2,000), appointed by the state board of education. Senators and representatives receive during the session of the legislature \$3 a day for the first 40 days, and \$1 50 a day afterward. The judiciary consists of a court of errors and appeals, court of chancery, supreme court, courts of common pleas, orphans' courts, courts of general quarter sessions of the peace, circuit courts, and courts of oyer and terminer. The court of errors and appeals is composed of the chancellor, the judges of the supreme court, and six other judges appointed by the governor. It has appellate jurisdiction only, and is the last court of resort. Three terms are held annually in Trenton. The governor, chancellor, and six judges of this court constitute the pardoning power. The chancellor is appointed by the governor and senate for seven years, and holds a court of chancery three times annually in Trenton; salary \$5,500 and fees. There is also a vice chancellor, whose annual salary is \$5,000. The court of chancery has jurisdiction over all cases in equity, and exclusive original jurisdiction in divorce cases. The supreme court consists of seven justices, appointed for seven years from each of the seven judicial districts. They hold circuit courts and courts of oyer and terminer three times a year in each county, and are *ex officio* judges of the court of common pleas, orphans' court, and court of general quarter sessions of the peace of the several counties. They receive salaries of \$5,000 each, except the chief justice, who receives \$5,200. Three terms of the supreme court are held annually in Trenton. Judges of common pleas, not exceeding three in each county, are also appointed by the legislature for five years, and hold court three times a year in each county. Sheriffs, coroners, and justices of the peace are elected by the people. Justices of the peace have jurisdiction in certain civil suits where the amount in controversy does not exceed \$100. The property of a woman married after March 25, 1852, which she owns at the time of marriage, continues her separate property, free from the control of her husband or liability for his debts. If over 21 years of age, she may make a will, which must not however dispose of any interest to which her husband would be entitled by law at her death. If living with her husband, she cannot convey her property without his concurrence. The grounds for divorce are adultery and desertion for three years. Aliens

may hold real estate. New Jersey is represented in congress by seven representatives and two senators, and has therefore nine votes in the electoral college.—The state debt was contracted during the war, chiefly for the support of families of volunteers, and amounted in 1874 to about \$2,500,000. It is represented by bonds of which about \$100,000 fall due annually. The payment of principal and interest is met by tax and the income of the sinking fund. The amount of money received and disbursed by the state treasury during the year ending Nov. 1, 1874, was as follows:

FUNDS.	Receipts.	Disbursements.
State fund	\$1,707,141 68	\$1,618,416 54
War fund	283,884 55	286,247 25
School fund (including state school tax)	1,363,547 20	1,352,481 00
Agricultural college fund	6,960 00	6,960 00
State library fund	3,550 00	1,211 37
Total	\$3,365,083 43	\$3,265,266 16

The chief expenditures from the state fund included, besides smaller items, the following:

Northern New Jersey lunatic asylum	\$603,000 00
Loans	200,000 00
Printing	118,898 34
State militia	77,066 35
Legislature	65,257 98
Salaries of judiciary	60,850 96
Salaries of state prison	51,954 25
Salaries and fees	46,488 30
Public schools	35,000 00
Appropriation to state reform school	34,500 00
Lunatic asylum	34,112 26
Transportation and costs	33,691 73
State industrial school	23,000 00
Pensions	21,865 73
State house extension	20,000 00
State house expenses	17,000 19
Support of deaf and dumb	16,283 21
Normal school	15,000 00
Support of blind	14,260 11

According to the federal census, the total assessed value of property in 1860 was \$296,682,492, and in 1870 it was \$624,868,971, including \$448,832,127 real and \$176,036,844 personal estate. The total taxable valuation was returned by the state authorities at \$603,665,497 in 1872, and \$612,796,106 in 1873. In 1874 the personal property was valued at \$117,431,284; real estate, \$359,357,510; total, \$619,057,903. Upon the total valuation of the state there is levied a general tax of one and a half mill and a school tax of two mills per dollar. Railroad corporations are taxed one quarter of one per cent. on the value of their roads, equipments, &c. New Jersey has heretofore made no provision for the education of its deaf and dumb, blind, or feeble-minded; but about \$40,000 is annually expended by the state for their support in the institutions of other states. In 1873 a committee appointed pursuant to an act of the legislature, to inquire into the condition and needs of these defective classes, reported that there were in the state not fewer than 500 deaf and dumb, about 600 blind, and more than 1,000 feeble-minded, and recommended the establishment of a state institution for the education of each class.

There are two institutions for the care of the insane. The lunatic asylum in Trenton was opened in 1848, since which time 4,588 patients have been treated. During the year ending Nov. 1, 1874, 840 were under treatment. Of the 655 in the asylum at the close of the year, 106 were supported by their friends, 21 by the state, and 528 by counties. In 1875 an additional asylum for the insane was nearly completed at Morristown, and is one of the largest institutions of the kind in the United States, having accommodations for about 1,000 patients. (See MORRISTOWN.) Prior to 1870, \$60,000 was annually appropriated by the legislature for the maintenance of convicts in the state prison at Trenton; but since that time the institution has been a source of income to the state. During the year ending Nov. 1, 1874, the earnings were \$104,042, including \$101,814 from convict labor, and the expenses \$58,807, leaving a net gain, not including officers' salaries (about \$30,000), of \$45,334. The whole number in confinement during the year was 1,025; at the end of the year, 653. The state reform school at Jamesburg was opened in 1867, and on Nov. 1, 1874, had 184 inmates; the total number during the year was 298. They are chiefly employed in making chairs and shoes and in farm labor. The state industrial school for girls is near Trenton, and in 1874 had 19 inmates. A home for disabled soldiers is supported by the state at Newark, in which 1,365 beneficiaries were cared for in 1874; and a soldiers' children's home at Trenton, which had 150 inmates at the close of 1874.—Prior to April, 1871, New Jersey had no free school system, but its schools were then made free. The tax for school purposes is now assessed and collected by the state instead of the townships, and the funds are apportioned among the different districts according to the school population. Every district is required to maintain a school for at least nine months in the year, or forfeit its share of the apportionment. The permanent school fund amounts to \$857,426. The amount of the income from this fund that is devoted to schools is determined by the legislature, and is now \$35,000 annually; the remainder of the income goes to increase the principal. In 1871 the state gave to the free school fund the proceeds of sales and rentals of all riparian lands lying between high and low water marks, and chiefly in and near the harbor of New York on the New Jersey shore. These lands will add to this fund not less than \$5,000,000, and possibly \$10,000,000. The sources and amount of the funds for the support of the schools for the year ending Aug. 31, 1874, were: 1, the two-mill state tax, which amounted to \$1,225,592; 2, additional state appropriation, including the income of the school fund, \$100,000; 3, interest of the surplus revenue, \$31,573; 4, township tax, \$23,834; 5, district and city tax for teachers' salaries, \$311,161; total, \$1,691,160, besides \$613,238 derived from

district and city taxation for building and repairing school houses. The more immediate supervision of the schools is vested in a state superintendent and county superintendents, all of whom are appointed by the state board of education. County superintendents are authorized to hold examinations and grant certificates to teachers. A law forbidding corporal punishment in schools was enacted in 1867. The condition of the public schools for the year ending Aug. 31, 1874, was as follows:

Number of school districts.....	1,869
“ “ buildings.....	1,498
“ “ departments.....	2,885
Capacity of public schools.....	155,152
Number of unsectarian private schools.....	253
“ of sectarian private schools.....	101
“ of persons between 5 and 15 years old.....	298,000
“ enrolled in public schools (68 per cent.).....	186,892
Average attendance (52 per cent.).....	96,224
Attendance upon private schools (12 per cent.).....	86,527
Number not attending school (25 per cent.).....	71,895
Average time schools kept open.....	9 mos. 12 days.
Number of male teachers in public schools.....	960
Average wages per month.....	\$65 77
Number of female teachers.....	2,256
Average wages.....	\$38 00
Total amount appropriated for schools (\$1,691,160 for maintenance and \$613,238 for building and repairing school houses).....	\$2,304,398
Valuation of school property.....	\$6,000,732
Average annual cost of education per pupil according to school population.....	\$5 67
According to average attendance.....	\$17 57

In several of the manufacturing cities and towns evening schools are maintained for adults and others unable to attend the day schools. There is an institution for training teachers at Trenton, comprising a normal school and a model school. There are two courses of study in the former, one of two and one of three years. In 1873-'74 there were 12 instructors and 269 pupils in the normal, and 17 instructors and 443 pupils in the model school. The Farnham school at Beverly, which is aided by the state, serves as a preparatory institution for the normal school. Since 1871 the state has supported a free library system in the public schools by extending aid to such districts as raise funds for this purpose, and nearly 400 free school libraries have been established and receive annual aid from the state.—New Jersey has four colleges: the college of New Jersey (evangelical Protestant), in Princeton (see PRINCETON); Rutgers (Reformed Dutch), in New Brunswick; Seton Hall (Roman Catholic), in South Orange; and Burlington college (Protestant Episcopal), in Burlington. Rutgers college, organized in 1770, has a classical department with a four years' course, and a scientific department with courses in civil engineering and mechanics, in chemistry and agriculture, and a special course in chemistry. The scientific department of this institution has been designated by the legislature as the state college of agriculture and the mechanic arts, and is therefore entitled to New Jersey's share of the national grant of lands made for this purpose by congress in 1862; and 40 state students are educated in this department free of expense for tuition. An extensive model

farm is connected with it. Several funds have been established for the aid of indigent students and to afford prizes for excellence in scholarship. In 1874-'5 there were 14 instructors and 188 students, including 62 in the scientific department. Seton Hall college was founded in 1856 at Madison, and removed to South Orange in 1860. It affords collegiate, ecclesiastical, and commercial courses. In 1873-'4 there were 13 instructors and 129 students in the collegiate department, and 4 instructors and 33 students in the ecclesiastical seminary. Burlington college, organized in 1846, has a collegiate and a preparatory course. In 1874-'5 there were 11 instructors and 59 students. Instruction in theology is afforded by Drew theological seminary (Methodist), opened in 1867 at Madison, and having in 1874-'5 9 instructors, 9 lecturers, 127 students, a library of 12,000 volumes, and productive funds amounting to \$250,000; the theological seminary of the Presbyterian church in Princeton, organized in 1812, and having in 1874-'5 7 instructors and 97 students; the German theological school (Presbyterian) at Bloomfield, organized in 1869, and having in 1874-'5 5 instructors and 24 students; and the theological seminary of the Reformed (Dutch) church in America at New Brunswick, organized in 1810, and having in 1874-'5 4 professors and 39 students. The last named is the chief training school in the United States for the ministry of that denomination. It is substantially a theological department of Rutgers college, as the Princeton seminary is of the college of New Jersey. The schools of science, besides that of Rutgers college, are the Stevens institute of technology at Hoboken, one of the leading institutions of the kind in the United States (see HOBOKEN), and the John C. Green school of science, connected with the college of New Jersey (see PRINCETON). The state has no medical or law school. There is a business college in Trenton and one in Newark, and New Brunswick has a conservatory of music. The chief institutions for the superior instruction of females are St. Mary's hall, Burlington; the female college at Bordentown; Ivy hall, Bridgeton; Trinity hall, Beverly; and the seminary and female collegiate institute at Pennington. St. Mary's hall (Protestant Episcopal) in 1874 had 28 instructors and 200 students.—According to the census of 1870, there were in the state 1,893 schools of all classes, including 1,531 public, 13 classical, professional, and technical, 278 day and boarding, and 71 parochial and charity. The total number of teachers in all was 3,889, and of pupils, 129,800. The total income was \$2,982,250, including \$49,000 from endowment, \$1,499,550 from taxation and public funds, and \$1,433,700 from other sources, including tuition. The total number of libraries in 1870 was 2,413, containing 895,291 volumes; 777 with 359,612 volumes were private, and 1,636 with 535,679 volumes other than private,

including 14 circulating libraries with 75,250 volumes. The most important libraries are those of the college of New Jersey, which has 28,000 volumes; the theological seminary in Princeton, 25,000; Newark library association, 21,000; the theological seminary in New Brunswick, 20,000; and the state library in Trenton. The total number of newspapers and periodicals reported by the census of 1870 was 122, with a circulation of 205,500 copies, and an annual issue of 18,625,740. There were 20 daily, circulation 38,080; 95 weekly, 120,670; and 7 monthly, 46,800. In 1874 there were 20 daily, 3 semi-weekly, 132 weekly, 1 bi-weekly, and 10 monthly; total, 166. The total number of religious organizations was 1,402, having 1,384 edifices with 573,303 sittings, and property valued at \$18,347,150. The leading denominations were represented as follows:

DENOMINATIONS.	Organizations.	Edifices.	Sittings.	Property.
Baptist, regular.....	164	164	61,913	\$2,376,400
" other.....	4	4	1,200	20,500

—The precise date of the first settlement of New Jersey is not ascertained. The earliest colony was probably planted at Bergen, between 1617 and 1620, by the Dutch of New Amsterdam, who claimed the whole country as a part of New Netherland. In 1623 a Dutch company under Cornelis Jacobson Mey and Adriaen Jorisz built Fort Nassau on the E. shore of the Delaware, a few miles below the present site of Philadelphia. Sir Edmund Ployden obtained a grant of the country on the Delaware from the king of England in 1634, and called it New Albion; and in 1638 a small party of Swedes and Finns purchased land in the same region from the natives, and planted several settlements. The Dutch and Swedes afterward drove out the English colonists, and in 1655 the Dutch under Peter Stuyvesant, governor of New Netherland, dispossessed the Swedes and sent most of them back to Europe. In 1664 Charles II. of England, disregarding the claims of both parties, granted all the territory between the Delaware

and Connecticut rivers to his brother the duke of York, and sent an expedition to take possession of it. New Amsterdam was first conquered, the New Jersey settlements at once submitted, and under the authority of Nicholls, the commander of the expedition and first governor, a patent was granted to immigrants from Long Island and New England. Elizabethtown, Newark, Middletown, and Shrewsbury were now founded. In the mean time, however, the duke of York had sold his claim to Lord Berkeley and Sir George Carteret; they named the tract New Jersey in honor of Sir George, who had been governor of the island of Jersey, and had held it for King Charles in his contest with the parliament. They formed a constitution for the colony, and in 1665 sent out Philip Carteret, brother of Sir George, as governor. He fixed the seat of government at Elizabethtown; but his administration was unpopular, and in 1670 the people revolted and chose James Carteret, an illegitimate son of Sir George, for their governor. Philip Carteret, however, obtained several concessions and promises from the proprietors, which induced the people to submit again to his authority. The first legislative assembly of New Jersey, which had been held under his proclamation in May, 1668, passed a bill of pains and penalties remarkable for its extreme severity, the punishment of death being assigned for no fewer than 12 offences. In March, 1673, Berkeley sold his interest in the proprietorship to John Fenwick and Edward Byllinge, Quakers. In July of the same year the Dutch recaptured New York, and the surrounding country, including the whole province of New Jersey, at once fell into their hands. New Jersey was called by them *Achter Kol*. It reverted to Great Britain by the treaty of 1674, and the question now arose whether the title returned to the proprietors or the king. To avoid all difficulty, the king recognized the claim of Carteret, and made a new grant to the duke of York, who also executed a fresh conveyance to Carteret, covering however only a part of the original territory of New Jersey. But before making this conveyance, the duke had included the province in a commission given to Sir Edmund Andros, governor of New York, who refused to recognize the authority as governor of Philip Carteret, arrested all magistrates who would not submit to his own jurisdiction, and finally, on April 30, 1680, carried Carteret himself prisoner to New York. The duke was at last prevailed upon to acknowledge the claims of the proprietors, and in 1681 the government of Andros came to an end. In the mean time Fenwick and Byllinge, to whom Berkeley had sold his share in the province, conveyed an interest in it to William Penn and two other Quakers, Garven Lawrie and Nicholas Lucas; and Fenwick in 1675 established a Quaker settlement at Salem, near the Delaware. He claimed authority as chief proprietor over all that part of New Jersey S.

W. of a line drawn from Little Egg harbor to a point on the Delaware in lat. 41° N.; and the province continued for some years to be divided into East Jersey, subject to Sir George Carteret and his heirs, and West Jersey, under Fenwick and his associates. In February, 1682, the whole territory was purchased by William Penn and 11 other Quakers. The first governor under the new proprietors was Robert Barclay, a Scotchman, and one of the 12 purchasers, under whom the country became an asylum for the oppressed members of his creed, and for a time enjoyed great prosperity. But the number of proprietors, the frequent subdivisions and transfers of shares, and various other difficulties in the way of good government, soon involved the province in trouble; and in 1702 the proprietors surrendered the rights of government to the crown. Queen Anne appointed Lord Cornbury governor of New York and New Jersey, but each continued to have a separate assembly. In 1708 New Jersey petitioned for a distinct administration, and Lewis Morris was appointed governor. The population was then about 40,000. Until the revolution New Jersey was the scene of no important event, and it was never much exposed to the ravages of the Indians. The last royal governor was William Franklin, the natural son of Benjamin Franklin. A state constitution was adopted in 1776, and throughout the revolution the country was frequently the theatre of war. The battles of Trenton, Princeton, Millstone, Red Bank, and Monmouth were fought on its soil. The first legislature met at Princeton in August, 1776, and chose William Livingston governor. The federal constitution was adopted by a unanimous vote, Dec. 18, 1787. The state capital was established at Trenton in 1790. The present constitution was ratified Aug. 13, 1844. In the summer of 1873 a board of 14 commissioners appointed by the governor agreed upon certain amendments to the constitution. Several of these were approved by the legislature of 1874; but before becoming a part of the constitution they must be approved by the legislature of 1875 and be ratified by the people at a special election held within four months after the dissolution of the legislature. New Jersey furnished 79,511 troops to the federal army during the civil war, or 55,785 reduced to a three years' standard. The legislature of 1870 refused to ratify the fifteenth amendment to the federal constitution, on the ground that the right to regulate suffrage was vested in the respective states. The first geological survey of New Jersey was made in 1839-'40 under the direction of Prof. Henry D. Rogers. A second survey was begun in 1854 by Dr. William Kittell, but was discontinued in 1856. The work was resumed in 1864, with Prof. George H. Cook as state geologist, and is still (1875) in progress. The results obtained up to 1868 are given in the "Geology of New Jersey" (1868) and annual reports. (See supplement.)

NEW JERSEY, College of. See PRINCETON.

NEW JERSEY TEA, the most common name for *ceanothus Americanus*, which is also called, in common with several other plants, red-root. The genus *ceanothus* (a name of unknown meaning), belonging to the buckthorn family (*rhhamnaceæ*), is represented in the Atlantic states by only four species, while on the Pacific coast there are about 20, several of which are large shrubs or small trees, others low prostrate mountain shrubs, and some have ever-green leaves. New Jersey tea is found from Canada to Florida, usually growing in dry woods as a low much-branched under-shrub, seldom over 3 ft. high; it has a dark red root; ovate, finely serrate, three-ribbed, very veiny leaves, which are downy beneath; and minute white flowers in dense clustered panicles. The flower has five-hooded petals on long claws, the same number of stamens, and a single pistil, which in fruit splits into three one-seeded

New Jersey Tea (*Ceanothus Americanus*).

carpels. It blooms in July, and so profusely as to be worthy of a place among ornamental shrubs. The leaves were among the many substitutes used for tea during the revolution. During the civil war they were used in some of the southern states, and were made the basis of an attempted fraudulent speculation at the north. It was announced that the true Chinese tea plant had been discovered in the mountains of a certain county in Pennsylvania, and its identity was certified to by an expert from Assam. After a time the prospectus of a company appeared, with engravings of the true tea leaf; but the fraud was soon exposed. An infusion of the leaves of New Jersey tea, prepared in the same manner as the true tea, has somewhat the taste of the commoner grades of the imported article, but it is probably quite destitute of any stimulating properties. The strong three-ribbed leaves distinguish it at sight from the true tea. The root has some astringency, and has been used in affections of the bowels, and to dye wool a

cinnamon color. A similar species, *C. ovalis*, has narrower, smooth leaves, pointed at both ends, and somewhat larger flowers. Some of the species of the far west are fine ornamental shrubs. *C. thyrsiflorus* is a small tree producing an abundance of light blue flowers, and known as the "California lilac." They are not hardy in the eastern states, though some of them succeed in England.

NEW JERUSALEM, the name applied in Rev. xxi. 2 to the city which John saw coming down from God out of heaven. Emanuel Swedenborg interprets this symbol as signifying the new church whose doctrines he was commissioned to teach. Hence the ecclesiastical organizations of his followers call themselves societies, &c., "of the New Jerusalem," or "of the New Church signified by the New Jerusalem." (For an account of their doctrines see SWEDENBORG, EMANUEL.) Swedenborg himself seems not to have contemplated the formation of such organizations, and gave no instructions for the purpose. In 1788, 16 years after his death, Robert Hindmarsh and others hired a chapel in London, and established public worship and preaching according to his doctrines. Their example was followed in other places, and about the beginning of the present century a general conference was formed of Swedenborgians in Great Britain, which in 1873 embraced 58 societies, containing altogether 4,019 members and 26 ministers; 24 of these societies, containing 2,147 members, were in Lancashire and the neighboring counties. The first Swedenborgian church in this country was formed in Baltimore in 1792; and in 1817 a general convention was called, which has met annually ever since, and in 1873 had connected with it 74 ministers and 93 societies, with 4,408 members, of whom 1,320 were in Massachusetts. There are besides a number of independent societies in the United States and on the continent of Europe, with an aggregate membership of perhaps 1,000. The denomination has no uniform liturgy or discipline, each society being left to itself, very much on the congregational system. Baptism (of infants as well as adults) and the Lord's supper are observed, and the worship and preaching resemble those of Protestants generally.

NEW KENT, a S. E. county of Virginia, bounded N. E. by the Pamunkey river, and S. W. by the Chickahominy; area, about 200 sq. m.; pop. in 1870, 4,381, of whom 2,361 were colored. Its surface is moderately uneven, and the soil light and sandy. The Richmond, York River, and Chesapeake railroad passes through it. The chief productions in 1870 were 20,719 bushels of wheat, 92,676 of Indian corn, 19,959 of oats, 8,600 lbs. of tobacco, and 5,122 gallons of sorghum molasses. There were 358 horses, 661 milch cows, 399 sheep, and 3,078 swine. Capital, New Kent Court House.

NEW LANARK. See LANARK.

NEW LEBANON, a town of Columbia co., New York, bordering on Massachusetts, on the

Harlem Extension railroad, 20 m. E. S. E. of Albany; pop. in 1870, 2,124. In the E. part is a large Shaker settlement (Mount Lebanon) of from 500 to 600 persons (including a few in the adjoining town of Canaan), owning about 4,000 acres of land. They have a large meeting house, a laboratory, a grist mill, five saw mills, a chair factory, two seed establishments, two machine shops, eight dwellings, a stone barn 196 by 50 ft., said to be the most perfect in the country, and seven other large barns. There are 26 buildings used as workshops. Their principal occupation is the raising and putting up of medicinal plants and garden seeds, the preparation of roots and extracts, and the manufacture of brooms and baskets. Of garden seeds and medicinal articles the annual production is about 200,000 lbs. The village of Lebanon Springs is a place of resort for its thermal springs, the largest of which discharges 16 barrels of water per minute. According to the analysis of Dr. Meade, a pint of the water contains 0.25 gr. chloride of calcium, 0.44 gr. chloride of sodium, 0.19 gr. carbonate of lime, and 0.37 gr. sulphate of lime. Gas, composed of 89.4 parts nitrogen and 10.6 parts oxygen, is constantly given out in the proportion of 5 cubic inches for every pint of water. The discharge of this spring supplies several baths, and keeps two or three mills running throughout the year. The waters have a uniform temperature of 73° at all seasons. There are several hotels. The town also contains an extensive establishment for the manufacture of medicinal extracts and pharmaceutical preparations, which makes its own glass ware; and it has the oldest thermometer factory in the United States.

NEW LEON. See NUEVO LEON.

NEW LONDON, a S. E. county of Connecticut, on Long Island sound, bordering on Rhode Island, bounded E. partly by the Pawcatuck and W. by the Connecticut river, and drained by the Thames river; area, about 650 sq. m.; pop. in 1870, 66,570. The surface is hilly, and in the southwest mountainous; the soil is best adapted to grazing. Fishing is extensively carried on. It is traversed by several railroads. The chief productions in 1870 were 16,846 bushels of rye, 247,362 of Indian corn, 174,300 of oats, 17,546 of buckwheat, 331,492 of potatoes, 64,441 tons of hay, 10,000 lbs. of tobacco, 64,738 of wool, 803,406 of butter, and 95,613 of cheese. There were 3,916 horses, 13,116 milch cows, 5,711 working oxen, 10,775 other cattle, 20,565 sheep, and 7,560 swine. There were 703 manufacturing establishments, with a capital of \$11,279,402, and annual products amounting to \$19,797,065, producing carriages and wagons, clothing, cotton goods, cotton thread, firearms, India-rubber goods, iron castings, machinery, paper, woollens, flour, and a variety of other articles. Capitals, New London and Norwich.

NEW LONDON, a city, port of entry, and one of the capitals of New London co., Con-

necticut, on the W. bank of the Thames river, 3 m. above its entrance into Long Island sound, and 40 m. S. E. of Hartford, in lat. 41° 18' 57" N., lon. 72° 5' 4" W.; pop. in 1850, 8,991; in 1860, 10,115; in 1870, 9,576. It is built on a declivity sloping S. and E., and the ground in the rear of the city rises to a considerable height. The streets were not originally laid out with much regularity, but have been greatly improved, and the new quarters are well graded. The private residences, owing partly to the influx of summer visitors who are attracted by the beautiful scenery of the neighborhood, are in many cases elegant and picturesque. The Pequot house, near the entrance of the harbor, has also made this city a fashionable summer resort. The Crocker house, recently built in the heart of the city, is one of the largest and best hotels in the state. Among the public buildings are a handsome granite custom house, a substantial and elegant brown-stone city building in which also the post office is situated, the court house, and the school houses and churches. The town has ample railroad communication by means of the New York, New Haven, and Hartford (Shore Line), the New London Northern, and the Stonington and Providence lines. There are two daily lines of steamers to New York. The largest wharf in New England is in course of construction at this port; it is 1,125 ft. long, 220 ft. wide at the river end, and 150 ft. at the shore end, at which vessels drawing 18 ft. may lie at low tide. The harbor is the best on Long Island sound, and one of the best in the United States. It is 3 m. long and 5 fathoms deep, sheltered by hills, seldom obstructed by ice, and defended by Fort Trumbull at the entrance. This fortress, which has been almost entirely rebuilt since 1840, is one of the best in the country, and mounts 80 pieces of heavy ordnance. It has accommodations for a garrison of 800 men. At the town of Groton, on the opposite side of the river, is Fort Griswold, the scene of the massacre by the British in 1781. (See GROTON.) On the E. bank of the Thames a United States navy yard is in course of construction. The inhabitants of New London have long been actively engaged in the whale fishery, in which the city ranks second only to New Bedford. Recently the seal fishery has been pursued by vessels from this port at Alaska and the South Shetland islands. The cod and mackerel fisheries for the New York and other markets are also important. There is some foreign and considerable coasting trade. The value of exports to foreign countries for the year ending June 30, 1874, was \$90,585; of imports from foreign ports, \$237,714. The number of entrances in the foreign trade was 30, aggregate tonnage 5,084; clearances 18, tonnage 3,026. The number of vessels engaged in the whale fishery was 17, of 2,735 tons; in the cod and mackerel fisheries 98, of 2,107 tons. The number of vessels belonging to the port was 191, with an aggregate tonnage of 20,624, viz.:

166 sailing vessels, tonnage 9,524; 24 steamers, 10,935; and 1 barge, 165. The town contains several iron foundries, machine shops, planing mills, a woollen and silk factory, &c. It has

five national banks, with an aggregate capital of \$975,000; graded public schools, including two high schools; a public library; a daily and a weekly newspaper; and eleven churches.—

New London.

New London was settled in 1649 by John Winthrop, son of the governor of Massachusetts. On Sept. 6, 1781, it was captured by a British force under Benedict Arnold, who set fire to the stores and shipping, and reduced the most valuable part of the town to ashes. They then attacked Fort Griswold at Groton, and massacred the garrison after it had surrendered. Fort Trumbull, not being tenable, as it was much exposed on the land side, had been evacuated.

NEW MADRID, a S. E. county of Missouri, bordering on the Mississippi river, by which it is separated from Kentucky and Tennessee, and intersected by White river; area, 880 sq. m.; pop. in 1870, 6,357, of whom 1,425 were colored. The surface is low and level, and in some places very productive. The remarkable earthquakes of 1811-'12 (see EARTHQUAKE, vol. vi., p. 361) severely injured this region, leaving a large portion of the land, now known as the "sunk country," under water. Various efforts have been made to reclaim the land. The county is intersected by the Cairo and Fulton railroad. The chief productions in 1870 were 3,990 bushels of wheat, 717,495 of Indian corn, and 2,875 of oats. There were 1,150 horses, 1,031 mules and asses, 1,744 milch cows, 699 working oxen, 2,064 other cattle, 465 sheep, and 13,172 swine. Capital, New Madrid.

NEWMAN, Edward, an English naturalist, born at Hampstead, May 13, 1801. He was a printer in London from 1840 to 1869, and published many popular scientific works. His "History of British Ferns" (1840), and "The Insect Hunters, or Entomology in Verse" (1858), have passed through several editions. Among his subsequent works are "Illustrated Natural History of British Moths" (1869), and "of British Butterflies" (1871).

NEWMAN. I. John Henry, an English clergyman, born in London, Feb. 21, 1801. He graduated at Trinity college, Oxford, in 1820, was elected a fellow of Oriel college in 1822, and there assisted Dr. Whately in preparing for publication the "Dialogues on Logic." He was ordained in 1824, in 1825 became vice principal of Alban Hall under Dr. Whately, and in 1826 a tutor of Oriel. He was appointed public examiner in 1827, and vicar of St. Mary's in 1828. In 1829 he opposed the reelection of Sir Robert Peel as member for the university of Oxford, because of that statesman's advocacy of Catholic emancipation. In 1830 he was chosen one of the select university preachers, and at the invitation of Hugh Rose began to write a history of the principal church councils, the first portion of which was published in 1833 under the title of "The Arians of the Fourth Century." Meanwhile the reform measures of Earl Grey, and the spread in England of German anti-dogmatic liberalism, gave rise to a strong conservative opposition in the English church, which Newman joined with the purpose of forming an Anglo-Catholic party. In December, 1832, he went to Italy with Hurrell Froude, and with him began in Rome the "Lyra Apostolica," which appeared monthly in the "British Magazine." Falling sick in Sicily, he returned to England in July, 1833. Soon after his arrival what is known as the "Oxford movement" was inaugurated by John Keble's sermon entitled "National Apostasy." Newman, finding that his associates differed widely as to the way of opposing liberalism and neutralizing the tendencies toward Rome, began the series called "Tracts for the Times," and a series of letters in the "Record" under the

heading of "Church Reform." He now wrote the historical sketches that appeared in the "British Magazine," and were afterward printed collectively as "The Church of the Fathers," aided in editing "The Library of the Fathers," and delivered lectures on "The Prophetic Office of the Church viewed relatively to Romanism and popular Protestantism" (London, 1837). In 1837 appeared his "Essay on Justification," controverting the Lutheran doctrine on that subject, while his "University Sermons" discuss the relation of faith and reason, and investigate the ultimate basis of religious belief. In the summer of 1838 he published a pamphlet on the "Real Presence," in which, seeking to give to the eucharistic doctrine an intellectual basis, he denied the objective reality of space. He now became editor of the "British Critic," and remained so till July, 1841. The bishop of Oxford having in 1838 animadverted publicly on the "Tracts for the Times," Dr. Pusey replied by denying their Romanizing tendencies. This opposition emboldened the tractarian writers, and Dr. Newman defined more and more clearly the relative positions of Anglicanism and Romanism, till his attempt to reconcile the Anglican teaching of the thirty-nine articles with Roman Catholic dogma culminated in Tract No. 90 in February, 1841. He was called upon to withdraw the tract, but refused. When the British and Prussian governments created a bishopric in Jerusalem (1841), he protested against the alliance about to be contracted in the East "with Nestorians, Monophysites, &c." In February, 1843, he made a formal retraction of the charges which he had uttered against the church of Rome, and in September gave up his living and resigned his office as a clergyman. To his house at Littlemore he had invited several persons whose minds were disturbed like his own, and this was represented as an attempted revival of monasticism. He busied himself and his associates with "Translations from Athanasius," and writing a series called "Lives of the English Saints," in order to give the writers "an interest in the English soil and the English church, and keep them from seeking sympathy with Rome." Some thirty writers were engaged in this work, the lives to form a periodical series with Dr. Newman as editor. The first two numbers only, containing the "Life of St. Stephen Harding" and "The Family of St. Richard," were edited by him, the others being published independently by their respective authors. He began his "Essay on the Development of Doctrine" in the beginning of 1845, was received into the Roman Catholic church Oct. 9, and left Oxford finally Feb. 23, 1846. Soon afterward Dr. Wiseman called him to Oscott, and thence sent him to Rome. There he took orders, and returning to England in 1848 established two houses of the Oratory of St. Philip Neri at Brompton and Birmingham, becoming superior of the latter, which in a few

years was transferred to Edgbaston. There he built a large convent and a spacious church, with a school for the sons of the gentry, and poor schools and other pious institutions in the neighborhood. He published in succession "Loss and Gain" (1848); "Sermons to Mixed Congregations" (1849); "Lectures on certain Difficulties felt by Anglicans in submitting to the Catholic Church" (1850); "Lectures on the Present Position of Catholics in England" (1851); and "Lectures on the History of the Turks in its relation to Christianity" (1853). In April, 1853, he was sued for libel by the ex-Dominican Achilli, and lost the suit, the costs of which were paid by public subscription. In 1854 he was appointed by the pope rector of the newly founded Catholic university of Dublin. Here, besides conducting the "Atlantis," the organ of the institution, he delivered several series of discourses and lectures on universities and university education, published in the collection of his works; "Sermons preached on Various Occasions" (1857); and "Callista, a Sketch of the Third Century." He resigned the rectorship of the university in 1859, and devoted himself to his labors and duties in the Oratory. Canon Kingsley having in "Macmillan's Magazine" for January, 1864, accused Dr. Newman and the Roman Catholic priesthood generally of thinking lightly of the virtue of veracity, a correspondence on this subject ensued, which was published in a pamphlet in February. This drew forth a second pamphlet from Kingsley, in which the imputation was renewed and aggravated. Dr. Newman replied in "Apologia pro Vita sua," issued in weekly numbers between April 21 and June 2, with an appendix on June 16, 1864. This work was afterward embodied in his "History of my Religious Opinions" (1865). In 1864 appeared "Verses on Various Occasions," and in 1865 "Letter to the Rev. E. B. Pusey, D. D.," in reply to some assertions in the latter's "Eirenicon," relative to the honors paid to the Virgin Mary. At the approach of the Vatican council a letter from Dr. Newman was published expressing dissatisfaction with the ultramontanes for urging factiously the definition of pontifical infallibility, but professing belief in the doctrine itself. In 1870 appeared a philosophical treatise entitled "An Essay in aid of a Grammar of Assent;" and in 1875, "A History of Arianism." In January, 1875, Dr. Newman published "A Letter addressed to his Grace the Duke of Norfolk, on occasion of Mr. Gladstone's recent Expostulation." A new uniform edition of Dr. Newman's complete works was begun in London in 1870, of which 25 volumes had been issued up to December, 1874. **II. Francis William**, an English author, brother of the preceding, born in London, June 27, 1805. He graduated at Worcester college, Oxford, in 1826, and in November became a fellow of Balliol college, which position he resigned in 1830, being unable conscientiously

to sign the thirty-nine articles previous to taking the degree of M. A. The three following years he spent in the East, and in 1834 he became classical tutor in Bristol college. In 1840 he was chosen classical professor at Manchester New college, and in 1846 professor of the Latin language and literature in University college, London, which office he resigned in 1863. In his works on theological subjects he has taken an exactly contrary course to that of his brother. Among them may be mentioned "Catholic Union: Essays toward a Church of the Future and the Organization of Philanthropy" (8vo, 1844); "A State Church not Defensible," a tract (1846); "A History of the Hebrew Monarchy, from the Administration of Samuel to the Babylonish Captivity" (1847); "The Soul, its Sorrows and Aspirations" (1849); "Phases of Faith, or Passages from the History of my Creed" (1850); and "Theism, Doctrinal and Practical" (1858). His other works include "Four Lectures on the Contrasts of Ancient and Modern History" (1847); "An Appeal to the Middle Classes on the urgent Necessity of numerous Radical Reforms, Financial and Organic" (1848); "On the Constitutional and Moral Right or Wrong of our National Debt" (1849); a tract on "The Crimes of the House of Hapsburg against its own Liege Subjects" (1851); "Lectures on Political Economy" (1851); and "Regal Rome, an introduction to Roman History" (1852). He has also published "A Collection of Poetry for the Practice of Elocution" (1850); "Odes of Horace translated into unrhymed Metres" (1853); "The Iliad of Homer translated into unrhymed Metres" (1856); "Homeric Translation in Theory and in Practice" (1861); "Text of the Iguvine Inscriptions" (1864); "The English and their Reforms" (1865); "A Handbook of Modern Arabic" (1866); "Miscellanies, Academical and Historical" (1869); "The Cure of the great Social Evil, with special reference to recent laws, delusively called Contagious Diseases Acts" (1869); "Orthoëpy, or a simple Mode of accenting English" (1869); and "Europe of the near Future, with three Letters on the Franco-German War" (1871). He assisted in editing a translation of Huber's work on "The English Universities" (1843), and in 1853 brought out an edition of the "Select Speeches of Kossuth." He is likewise author of "Lectures on Logic," of a "Grammar of the Berber Language," and of a work on the "Difficulties of Elementary Geometry." He has in preparation (1875) an English-Arabic dictionary in Roman type, on a new plan.

NEWMARKET, a market town of England, consisting mainly of one long street, wide and well lighted, the N. side of which is in Suffolk and the S. side in Cambridgeshire, 13 m. E. by N. of Cambridge, and 56 m. N. E. of London, with which it is connected by the Eastern Counties railway; pop. in 1871, 4,534. It contains a corn market, assembly rooms, a handsome church, several schools, and a jockey

club. There are 15 establishments for training horses, which is the principal business of the place. It derives its chief importance from the races, seven of which are held annually, viz.: the Craven and the first and second spring meetings, in April and May, at fortnightly intervals; the July; and the first and second October meetings and the Houghton, in October, a fortnight apart. The race course, considered the best in Great Britain, is about 3 m. from the town, and between 4 and 5 m. in circuit. There is also a training ground about 1½ m. long. In the principal church is a monument to Frampton, who was trainer to Queen Anne and to George I. and II. Near Newmarket is Chippendale park, with fine pleasure grounds. An old Roman intrenchment, called the Devil's ditch, runs directly across the heath upon which the race course is situated.

NEWMARKET CAVE. See supplement.

NEW MEXICO, a territory of the United States, situated between lat. 31° 20' and 37° N., and lon. 103° and 109° W.; length on the E. boundary 345 m., and on the W. boundary 390 m.; average breadth N. of the 32d parallel, 335 m.; area, 121,201 sq. m. It is bounded N. by Colorado, E. by Indian territory and Texas, S. by Texas and Mexico, and W. by Arizona. The territory is divided into 13 counties, viz.: Bernalillo, Colfax, Doña Ana, Grant, Lincoln, Mora, Rio Arriba, San Miguel, Santa Ana, Santa Fé, Socorro, Taos, Valencia. Santa Fé, the capital, had 4,765 inhabitants in 1870. The principal other places are Albuquerque, Cimarron, Fernando de Taos, Las Cruces, Las Vegas, Mesilla, Mora, Placita, and Silver City, each having more than 1,000 inhabitants. The population of the territory, according to the federal censuses, has been as follows: 1850, 61,547; 1860, 93,516; 1870, 91,874, of whom 172 were colored and 1,309 non-tribal Indians. The apparent decrease between 1860 and 1870 is due to the setting off of territory to form Arizona and a portion of Colorado. Making allowance for the inhabitants thus transferred, there was an actual increase within the present limits of New Mexico of about 20,000. Next to the District of Columbia it is the most populous territory in the Union. Of the total population in 1870, 86,254 were native and 5,620 foreign born, 47,135 males and 44,739 females. Of the natives, 83,175 were born in the territory; of the foreigners, 3,913 were born in Mexico. The number of male citizens of the United States 21 years old and over residing in the territory was 22,442. There were 21,449 families, with an average of 4.28 persons to each, and 21,053 dwellings, with an average of 4.36 to each. There were 48,836 persons 10 years old and over who could not read, and 52,220 who could not write; of the latter 49,311 were natives and 2,909 foreigners, 23,779 males and 28,441 females; 9,718 were from 10 to 15 years of age, 10,005 from 15 to 21, and 32,497 were 21 years old and upward, of whom 15,031 were males.

The number of blind persons was 159; deaf and dumb, 48; insane, 50; idiotic, 46. There were 24 convicts in prison on June 1, 1870; number of persons convicted of crimes during the preceding year, 95. Of the whole number (29,361) 10 years old and upward returned by the census as engaged in all occupations, there were employed in agriculture 18,668, including 10,847 agricultural laborers and 7,629 farmers and planters; in professional and personal services, 7,535, including 51 clergymen, 1,365 domestic servants, 3,348 laborers, 48 lawyers, 27 physicians and surgeons, 1,116 United States soldiers, and 49 teachers; in trade and transportation, 863; in manufactures and mining, 2,295. Nearly all the inhabitants are of Mexican descent and speak the Spanish language. Much of New Mexico, especially the S. and W. parts, has until recently been subject to Indian incursions, and the Apaches in the south are still somewhat troublesome. The number of tribal Indians (not included in the census) in the territory in 1874, according to the report of the United States commissioner of Indian affairs, was 25,268, viz.: Navajos, occupying a reservation of 5,400 sq. m. in the northwest, partly in Arizona, 9,068, besides 2,000 not on the reservation; Mescalero Apaches, with an agency at Fort Stanton in the southeast, 1,800; Southern or Gila Apaches, on a reservation near the hot springs in the southwest, 400; Capote Utes (500), Weeminuche Utes (750), and Jicarilla Apaches (500), of the Abiquiu or Tierra Amarilla agency, about 100 m. N. W. of Santa Fé, 1,750; Muache Utes (290) and Jicarilla Apaches (460), of the Cimarron agency in the northeast, 750; Pueblos, occupying 19 pueblos or villages in the N. W. part of the territory, 9,500. The Pueblos have several times been decided by the territorial courts to be citizens of the United States, but have preferred to retain their tribal organization, each village having its own government. (See PUEBLO INDIANS.)—The general surface of New Mexico consists of high level plateaus, traversed by ranges of mountains, between which are many broad fertile valleys, and from which rise occasional isolated peaks of great height. The valley of the Rio Grande has an elevation of between 5,000 and 6,000 ft. above the sea near the N. boundary, 4,800 ft. at Albuquerque (lat. 35°), and 3,000 ft. at El Paso, Mexico, near the S. boundary of the territory. The general altitude of the mountain ranges on each side of the valleys of the Rio Grande and the Pecos is between 6,000 and 8,000 ft. above the sea, sometimes, especially in the north, rising to 10,000 or 12,000 ft., the summits being covered with perpetual snow. Mt. Taylor in the Sierra Madre range, S. W. of Santa Fé, rises 10,000 ft. above the valley of the Rio Grande. The general direction of the mountains and streams is from N. to S. The Rocky mountains before entering the territory from Colorado are divided into two ranges. The eastern, formed by lofty peaks and high

continuous ridges, terminates abruptly a few miles S. of Santa Fé; the western, called the Sierra Madre, consists of many detached mountains of less height, with low passes between them, and forms the connecting link with the Sierra Madre of Mexico. Nearly two thirds of the territory lies E. of the Sierra Madre. S. of the termination of the E. range of the Rocky mountains a lofty plateau extends between the Rio Grande and Pecos, interrupted by numerous minor ranges of mountains. The region W. of the Sierra Madre has been imperfectly explored, but is known to contain table lands or *mesas* (often standing apart from each other and bearing great resemblance to gigantic fortresses and castles) and detached ranges of mountains, with many fertile valleys and occasional peaks of extinct volcanoes. E. of the Pecos river and the E. range of the Rocky mountains the country slopes gradually toward the Mississippi river and the gulf of Mexico. The S. E. part of the territory is occupied by the W. portion of the Llano Estacado or Staked Plain, an elevated tract destitute of wood, and of any vegetation except immediately after rain, of which the fall here is slight.—The principal river is the Rio Grande del Norte, which, rising in Colorado and entering New Mexico between the Sierra Madre and the E. range, flows S. through the entire territory, and, after forming the boundary between Texas and Mexico, enters the gulf of Mexico. The Pecos rises on the E. slope of the E. range, flows S. through the E. portion of the territory, and joins the Rio Grande in Texas. These two rivers have many small tributaries, chiefly from the west. The largest of those of the Rio Grande are in the N. part of the territory. The N. E. section is drained by the head waters of the Canadian, a branch of the Arkansas, and the N. W. corner by the San Juan, a tributary of the Colorado of the West. In the southwest are the sources of the Gila, and here also is the Rio de los Mimbres, which flows S. into Mexico. The central portion of the region W. of the Rio Grande contains the sources of the Colorado Chiquito or Little Colorado, which flows N. W. and joins the Colorado of the West in Arizona.—Most of the mountains of the central plateau between the Rio Grande and Pecos are composed chiefly of syenitic rocks, which during their upheaval broke through palæozoic sandstones and carboniferous limestones. The limestones are found generally on the flanks of the ridges, but sometimes on their tops. Both the syenites and carboniferous limestones are traversed by mineral lodes. Dikes of porphyry are frequently met with near the lines of intersection. The plateau itself has underlying it for the most part tertiary and lower cretaceous rocks. The sandstone frequently forms table mountains or *mesas*, and contains in many localities beds of lignite and bituminous coal, 2 to 5 ft. thick, alternating with layers of iron ore, fire clay, and shales. The latter are frequently filled with large fossil leaves. Where-

ever eruptions and overflows of porphyry have acted upon the formations containing coal, the latter has been completely metamorphosed into anthracite of excellent quality. Variegated marls and beds of gypsum are exposed in many localities on this plateau. W. of the Rio Grande the same formations are met with. The extensive layers of lava, spread in several localities horizontally upon the sandstone strata, are a characteristic feature of the geology of New Mexico. Many of the streams flow through deep cañons, that of the Rio Grande W. of Taos being more than 1,000 ft. deep, with perpendicular walls. Mines of anthracite have been opened at the Old Placer mountains. There are hot and mineral springs in many portions of the territory, possessing curative properties. Salt lakes (*salinas*) are numerous, particularly between the Rio Grande and Pecos, S. of Santa Fé; they furnish a large portion of the supply of salt for the territory and adjacent portions of Mexico. The precious metals and copper are abundant, and mines of these were worked in Spanish and Mexican times; more recently lack of capital, want of water in many districts, and Indian hostilities have retarded their development. The annual product of gold for several years past, according to the United States commissioner of mining statistics, has been about \$500,000. The principal mines are those of the Moreno gold fields in Colfax co., on the E. slope of the Rocky mountains, in the N. part of the territory; of the Pinos Altos district in Grant co., in the S. W.; and of the Old and New Placer mountains in Santa Fé and Bernalillo cos. There are also gold mines in the Sierra Blanca, Carrizo, Patos, and Jicarilla mountains in Lincoln co.; in the Magdalena mountains in Socorro co.; in Rio Arriba and Taos cos., N. and N. W. of Santa Fé; and in other places. These are chiefly placer mines, but quartz lodes are worked at some points to a limited extent. Silver is not now largely mined, but there are deposits of it at Pinos Altos, in the Organ mountains in the south, in the Cerillos and Sandia mountains near the centre of the territory, in the Magdalena mountains, and in other places. Copper is found in the Pinos Altos region, where one mine is in operation, yielding about 9,000 lbs. of metal a week; in the Manzano mountains, in Bernalillo and Valencia cos.; in the Mogollon mountains, near the Arizona border; in the Magdalena mountains, and elsewhere. Lead occurs in the Pinos Altos mines, in the Organ mountains, and in other parts of the territory. Iron is found at the Moreno mines, in the Placer mountains, near Pinos Altos, and near Embudo, between Santa Fé and Taos, as well as at other points. Zinc, manganese, quicksilver, and other minerals occur. The census of 1870 returns 17 mines (all gold), of which 12 were placer and 5 quartz; number of hands employed, 177; capital invested, \$2,384,000; wages paid during the year, \$107,550; value

of materials used, \$33,138; of products, \$343,250. The amount of gold from New Mexico deposited at the United States mints and assay offices to June 30, 1874, was \$1,004,755 72; of silver, \$239,574 49.—The climate varies much. Near Santa Fé and in the mountains the winter is severe. N. of Santa Fé the days are never sultry and the nights are always cool. In the south the temperature is mild, being seldom below the freezing point, and rarely rising to extreme heat, owing to the elevation of the surface. The sky is generally clear and the atmosphere dry, so that meat may be preserved for a long time without salt. In the south the rainy season is in July and August. The annual rainfall varies from 10 to 30 inches in different localities. The mean temperature at Santa Fé (lat. 35° 41', elevation 6,862 ft.) for six years has been as follows: spring, 49·7°; summer, 70·4°; autumn, 50·6°; winter, 31·6°; year, 50·6°. For the year ending Sept. 30, 1873, the mean temperature at the same place was 49°; of the warmest month (July), 71°; of the coldest month (January), 29°; total rainfall, 8·59 inches; greatest monthly rainfall (August), 2·79 inches. The highest temperature observed during the calendar year 1873 was 88°; lowest, —5°. The diseases are few. Inflammations and typhoid fevers sometimes appear in the winter season; rheumatism is more prevalent, arising doubtless from the common practice of sleeping on the ground. Pulmonary complaints are scarcely known. The number of deaths in 1870 was 1,180, of which 420 were from general diseases (including 36 from scarlet fever, 11 from typhus fever, 90 from enteric fever, 12 from intermittent fever, 31 from remittent fever, 39 from rheumatism, and 45 from consumption), 60 from diseases of the nervous system, 33 of the circulatory system, 305 of the digestive system, 161 of the respiratory system (including 63 from pneumonia), and the rest from miscellaneous causes. The proportion of deaths from consumption was smaller than in any state or territory except Arizona.—The valleys of nearly all the streams and such portions of the table lands as are within the reach of irrigation are very productive. The most important agricultural regions are the valleys of the Rio Grande and Rio Pecos, which are generally from 1 to 4 m. wide, the former expanding in places to 10 or 15 m. Owing to the slight fall of rain, artificial irrigation is necessary. The supply of water is obtained by constructing from the streams, at the general cost, large canals, called *acequias madres*, of sufficient capacity for an entire settlement, from which each farmer constructs a minor canal to his own land. Some of these main canals are 20 or 30 m. long. Large portions of the table lands too remote or elevated to be irrigated from the streams possess a fertile soil. Whether a supply of water for their irrigation can be obtained by artesian wells or otherwise remains undetermined. Agriculture

is mostly carried on in a very primitive manner. The principal crops are Indian corn, wheat, barley, oats, apples, peaches, melons, apricots, and grapes. The territory is especially adapted to the culture of the grape, the yield of fruit being abundant, and the wine produced of excellent quality. Potatoes do not generally thrive, but cabbages, onions, pumpkins, &c., grow well; and in the south quinces, pomegranates, and figs may be raised. The country is better adapted to stock raising than farming. Large tracts, where agriculture is not practicable, afford abundant pasturage. Owing to the mildness of the climate, artificial shelter is never required. The valleys, foot hills, and table lands are covered with nutritious grasses, the most valuable variety being the mezquite or grama grass, which preserves its nutritive properties and furnishes abundant food throughout the winter. Sheep raising is one of the chief industries of the territory; the flocks are almost entirely free from disease and require little care. The principal forests are confined to the mountain ranges, and consist chiefly of pine, cedar, spruce, and other evergreens. On the foot hills there are extensive tracts of *piñon* or nut pine and cedar, and along the margins of the streams belts of cottonwood, sycamore, and other deciduous trees, while in the south groves of oak and walnut are abundant. The principal wild animals are the deer, mountain sheep, antelope, elk, cougar, ocelot, lynx, bear, coyote, wolf, weasel, hare, squirrel, and beaver. Wild turkeys, geese, ducks, sage hens, prairie chickens, &c., occur.—The number of acres of improved land in farms in 1870 was 143,007; number of farms, 4,480, of which 1,345 contained less than 10 acres each, 1,172 from 10 to 20, 1,293 from 20 to 50, 358 from 50 to 100, 299 from 100 to 500, 9 from 500 to 1,000, and 4 more than 1,000; cash value of farms, \$2,260,139; of farming implements and machinery, \$121,114; amount of wages paid during the year, including the value of board, \$523,888; estimated value of all farm productions, including betterments and additions to stock, \$1,905,060; value of orchard products, \$13,609; of produce of market gardens, \$64,132; of forest products, \$500; of home manufactures, \$19,592; of animals slaughtered or sold for slaughter, \$224,765; of live stock, \$2,389,157. The productions were 338,930 bushels of spring wheat, 13,892 of winter wheat, 42 of rye, 640,823 of Indian corn, 67,660 of oats, 3,876 of barley, 10 of buckwheat, 28,856 of peas and beans, 3,102 of Irish potatoes, 8,587 lbs. of tobacco, 684,930 of wool, 12,912 of butter, 27,239 of cheese, 19,686 gallons of wine, 813 of milk sold, 1,765 of sorghum molasses, and 4,209 tons of hay. The live stock consisted of 5,033 horses, 6,141 mules and asses, 16,417 milch cows, 19,774 working oxen, 21,343 other cattle, 619,438 sheep, and 11,267 swine. There were also 21,467 horses and 128,767 cattle not on farms. The number of manufacturing establishments

was 182, having 13 steam engines of 252 horse power, and 42 water wheels of 659 horse power; number of hands employed, 423; capital invested, \$1,450,695; wages paid during the year, \$167,281; value of materials used, \$880,957; of products, \$1,489,868. The only important establishments were 36 flouring and grist mills, value of products \$725,292; 12 saw mills, \$121,225; and 7 quartz mills, \$399,712. There are no railroads in operation in the territory, but several lines are projected through it. The Texas and Pacific, in progress in Texas, is to pass through the S. portion; the Atchison, Topeka, and Santa Fé is in progress from Granada, Colorado, its present terminus, to Santa Fé, through the N. E. portion of the territory; and the Denver and Rio Grande, in operation to Pueblo, Colorado, and still in course of construction, is intended to pass down the valley of the Rio Grande. The projected line of the Atlantic and Pacific railroad passes through New Mexico along the 35th parallel, but no progress has been made since its completion some years since to Vinita, Indian territory. There are two national banks at Santa Fé, with a joint capital of \$300,000.—The executive power is administered by a governor and secretary, appointed by the president with the consent of the senate for four years, and by an auditor, treasurer, adjutant general, and attorney general, chosen by the territorial legislature. This body consists of a council of 13 and a house of representatives of 26 members, elected by the people for two years. The judicial power is vested in a supreme court, with appellate jurisdiction; district courts, with general original jurisdiction; probate courts, and justices of the peace. The supreme court is held by three judges, appointed by the president with the consent of the senate. The district courts (one in each of the three judicial districts into which the territory is divided) are held by a single judge of the supreme court. There is a probate court for each county. The valuation of property, according to the United States censuses, has been as follows:

YEARS.	ASSESSED VALUE.			True value of real and personal property.
	Real estate.	Personal property.	Real and personal.	
1850...	\$5,174,471
1860...	\$7,018,260	\$13,820,520	\$20,838,780	20,813,768
1870...	9,917,991	7,866,023	17,784,014	81,349,798

The total taxation in 1870 was \$61,014, of which \$34,115 was territorial, \$26,101 county, and \$798 town, city, &c. There was no territorial debt at that date. The receipts into the territorial treasury in 1874 were \$46,317 82; expenditures, \$43,361 59.—Prior to 1871 there were no public schools in the territory. In that year a law was passed organizing a system of free public schools, and placing them under the management of a board of supervi-

sors and directors for each county, consisting of three persons elected biennially, with the probate judge of the county as *ex officio* president of the board. The school fund consists of 25 per cent. of the entire tax on property, a poll tax of \$1 on every male citizen above the age of 21 years, and any "surplus of more than \$500 in the treasury of any county after paying the current expenses of such county." The statistics of the schools for 1873 are as follows:

CLASS OF SCHOOLS.	Number of schools.	Pupils.	Teachers.	Average number of months taught.	Income.
Public schools supported by taxation.....	183	5,625	186	6½	\$29,721 57
Private schools.....	26	1,370	53	9	27,100 00
Pueblo schools.....	5	107	7	6	4,000 00
Total.....	164	7,102	196	\$60,821 57

Of the public schools, 10 were taught in English, 111 in Spanish, and 12 in both languages. The Pueblo schools were all English. Of those classed as private several are conventual and other Catholic schools; 7 were English and 19 mixed. According to the census of 1870, the number of schools of all kinds was 44, with 72 teachers, 1,798 pupils, and an income of \$29,886. In the same year there were 116 libraries with 39,425 volumes, of which 83 with 29,805 volumes were private. Of those not private, 24 were church libraries, with 3,250 volumes; 3 Sabbath school, 760; 2 school, college, &c., 1,200; 2 court and law, 210; 1 territorial, 4,000; and 1 circulating, 200. The number of church organizations was 158, with 152 edifices, 81,560 sittings, and property to the value of \$322,621. Of these, 152 organizations, with 149 edifices, 80,710 sittings, and property to the value of \$313,321, were Roman Catholic. There were also a Baptist, a Methodist, a Presbyterian, and three Episcopal organizations. In 1874 one daily (English and Spanish) and 11 weekly (5 English and 6 English and Spanish) newspapers and one semi-monthly periodical were published.—New Mexico was among the earliest of the interior portions of North America visited by the Spaniards; and distant as it is from the sea, the adventurous spirit of that people led them here nearly a century before the English had landed on the shores of New England. Alvar Nuñez (Cabeça de Vaca), with the remnant of those who accompanied Narvaez to Florida, reached New Mexico before 1537, and made a report to the viceroy of Mexico of what they saw. The expedition of Marco de Niza followed in 1539, and that under Coronado the next year. The latter traversed the country N. of the Gila occupied by the Pueblo Indians, and pushed his way eastward beyond the Rio Grande to the country of the *cibola* or bison, and is the first who speaks of that animal, which he calls "a new kind of

ox, wild and fierce, whereof the first day they killed fourscore, which sufficed the army with flesh." The great prairies and desert plains of New Mexico are so truthfully described by Castaneda, the historian of the expedition, that no doubt remains of his having crossed the entire country. In 1581 other adventurers under Capt. Francisco de Bonillo reached the country, and on their return made known the mineral wealth existing there, which caused the name of New Mexico to be applied to it. About this period Agustin Ruiz, a Franciscan missionary, entered the country, and was soon after murdered by the Indians. A more successful official of the government was Don Antonio Espejo, who took with him a body of men to protect the missions. The viceroy of Mexico sent Juan de Oñate to take formal possession of the country in the name of Spain, and to establish colonies, missions, and forts there. The year of his arrival is by some writers stated to be 1595, by others 1599. The missionaries met with great success in Christianizing the native tribes. The Pueblo Indians were more ready to adopt the new faith than the roving tribes; and it is a singular fact that on rediscovering some of these Pueblos, when they had been without any priest for nearly a century, many of the Christian rites and doctrines were found among them, though strangely blended with their own religion. Espejo found the people considerably advanced in civilization. They wore garments of cotton of their own manufacture. Their arms were large bows, and arrows terminated with sharp-pointed stones; their long wooden swords were also armed with sharp stones. They carried shields made of the raw hides of bison. Some of the people lived in stone houses several stories high, the walls of which were ornamented with pictures; these lived in the valleys and cultivated the soil. In the villages were seen a great many idols, and in every house was a chapel dedicated to some evil genius. Oñate is said by historians to have been the most successful of all the officials sent to New Mexico. Many new missions were established, mines were opened and worked, and the country was in a flourishing state. But the enslavement of the Indians by the colonists, who compelled them to labor in the mines, was too much for them to bear. They made several ineffectual efforts to rid themselves of their oppressors, and finally in 1680 drove out the Spaniards, and recovered the whole country as far south as El Paso del Norte. It was not until after several attempts that the Spaniards regained possession of the country in 1698. In 1846 Santa Fé was taken by a United States force under Gen. Kearny, who soon after conquered the whole territory from Mexico. In 1848 it was ceded to the United States by the treaty of Guadalupe Hidalgo. A territorial government was organized by the act of Sept. 9, 1850. The region S. of the Gila river, known as the Gadsden

purchase, was obtained from Mexico by the treaty of Dec. 30, 1853, and was annexed to New Mexico by the act of Aug. 4, 1854. The territory then contained, besides the region within its present limits, the whole of Arizona and a portion of Colorado and Nevada. The tract (about 14,000 sq. m.) E. of the Rocky mountains and between the 37th and 38th parallels was annexed to Colorado by the act of Feb. 28, 1861. Arizona was set off by the act of Feb. 24, 1863; and by the act of May 5, 1866, the N. W. corner of Arizona was annexed to Nevada. The question of the admission of New Mexico as a state has several times been before congress. At the close of the 43d congress, March, 1875, a bill for its admission failed to become a law.—See "New Mexico," by Elias Brevort (Santa Fé, 1874). (See supplement.)

NEW MILFORD, a town of Litchfield co., Connecticut, on the Housatonic river and railroad, 40 m. W. by S. of Hartford; pop. in 1870, 3,586. The principal village, on the left bank of the river, is neatly laid out with wide and well shaded streets, has a handsome common, and is supplied with pure water. It has a national bank, a savings bank, a weekly newspaper, a court room for the sessions of the district court, four churches, and about 25 stores. It is the centre of the tobacco trade of the entire valley, and has 10 warehouses; it also contains manufactories of paper, buttons, and woollen cloths.

NEW ORLEANS (Fr. *La Nouvelle Orléans*), the capital, chief city, and commercial metropolis of Louisiana, the ninth city of the United

States in point of population, nearly coextensive with the parish of Orleans, situated on both banks (but chiefly on the left) of the Mississippi river, 100 m. above its mouth, and 960 m. in a direct line S. W. of Washington; lat. of custom house, 29° 57' N., lon. 90° W. The river here has a general E. and W. direction. The older portion of the city is built on the left bank, on the convex side of a bend of the river, from which circumstance it derives its familiar sobriquet of the "Crescent City." In the progress of its growth up stream, it has now so extended itself as to follow long curves in opposite directions, so that the river front on the left bank presents an outline somewhat resembling the letter S, and 11 or 12 m. in extent. The city includes, on the left bank, the town of Carrollton, formerly belonging to the parish of Jefferson, and the whole of the parish of Orleans, except the portion lying between Bayou Chef Menteur and the Rigolets pass; and on the right bank, the town of Algiers. The greater portion of this region is not built up, but consists of market gardens, swamps, canebrakes, and bayous. The boundaries of the city on the left bank are: on the west, the upper line of Carrollton and the line of the old Jefferson and Lake railroad; on the north, Lake Pontchartrain; on the east, Bayou Chef Menteur; and on the south, Lake Borgne, Bayou Bienvenu, Fisher's or Fisherman's canal, and the Mississippi. On the right bank, Algiers is bounded N. E. by the Mississippi river and by the line of Ptolemy street, running southeasterly (nearly as a continuation of Canal street on the left bank),

New Orleans.

and by other lines zigzagging more easterly, and terminating at Point Becca on the Mississippi. That portion of the parish of Orleans which alone has not been included in the city consists of a series of islets called Les Petites Coquilles, from the extent to which

small shells enter into the composition of their soil. These islets surround a body of water from Lakes Pontchartrain and Borgne which is called Lake Catharine. At the Pontchartrain end of the Rigolets pass, on one of these islets, stands Fort Pike; on another, at the

Lake Borgne end of the Rigolets, stands Fort Macomb. Near the western border of Bayou Chef Menteur stands Fort Wood. Fort Pike is in lat. $30^{\circ} 10' N.$, lon. $89^{\circ} 38' W.$, about 30 m. from the centre of the drainage sections of the city. Fort Wood is in lat. $30^{\circ} 8' N.$, lon. $89^{\circ} 51' W.$ Fort Macomb is about 6 m. S. E. of Fort Pike, and is virtually if not actually abandoned. Fort Pike, being surrounded by salt water, is healthy, while Fort Wood, standing in the midst of marshes, is very insalubrious. From the western boundary of the city to the northeastern (that is, from Carrollton upper line to Bayou Chef Menteur) the distance is about 22 m.; greatest breadth, at the N. E. extremity, nearly 10 m.; breadth from the lake to the river, in the drainage sections, $7\frac{1}{2}$ m.; least breadth, from Lake Pontchartrain to Bayou Bienvenu, about 5 m.; total area of the present statutory city, about 150 sq. m. The actual city, however, is comprised within the drainage sections, of which not more than one half is closely inhabited, while the other half comprises much that is but barely redeemed from original swamp. These sections cover an area of 26,026 acres, or about $40\frac{3}{4}$ sq. m. They are bounded by lines which have been run for a contemplated protection levee, and by the river. The W. line is the upper line of the city from the river to the lake, a distance of nearly $5\frac{1}{4}$ m.; the N. line skirts the shore of the lake for nearly $4\frac{1}{2}$ m.; the E. line is irregular, running from the lake to the river, a total distance of about $7\frac{3}{4}$ m. It is proposed to make this protection levee sufficiently broad at the top to form a good road. On the lake shore considerable progress has already been made, the levee along the river having long since been built. The region enclosed by these lines is lower than the surface of the Mississippi at high water, and besides has a slight general declination toward the lake. Somewhat further back than its centre it is crossed by an irregularly curved ridge, called the Metairie ridge on the W. side of the bayou St. John, and the Gentilly ridge on the E. side. Along these ridges run a bayou and a road bearing the same name, but the bayou Gentilly is better known, at least in its eastern course, as the bayou Sauvage, the name originally given to it. The bayou St. John, running southerly, from about the centre of the protection levee line along the lake, for a distance of nearly 4 m., is continued by the Carondelet canal some 2 m. further in a southeasterly direction to what is known as the Old basin, which stands at the end of Toulouse street, at a distance of about half a mile from the river. About two fifths of a mile from the W. extremity of the lake protection line the New Orleans canal, generally called the New canal, starts parallel to the bayou St. John, and runs S. and S. E. about $6\frac{1}{2}$ m. into what is known as the New basin at the end of Julia street, about three quarters of a mile from the river. Connected with these bayous and canals are a number of others by

means of which the city within the limits we are considering is drained. Many new ones are contemplated, several have lately been constructed, old ones have been lengthened, deepened, and otherwise improved, and some useless or objectionable ones have been filled up. By the bayou St. John and the New canal small vessels bring large quantities of articles from Mobile, Pensacola, the lake shores, and their vicinities. These are, besides some cotton, principally lumber, shingles, sand, shells, bricks, tar, oysters, wood, charcoal, fire clay, and garden produce. As many as 50 or 60 vessels have been seen in the basins at the same time. Some of these are large schooners, and a few small stern-wheel steamboats have plied among them. North of the Metairie bayou, near the western protection levee line, was the famous Metairie race course; and south of the bayou, somewhat nearer the levee line, is the Oakland race course. On the same ridge, between the New canal and the bayou St. John, somewhat nearer the latter, is the old city park. Here are numbers of fine large oaks and other trees, as there are also around the race courses and more or less along the whole ridge. This park has never had any proper attention paid to it, and is now but little frequented. A little east of the bayou St. John, on the Gentilly ridge, is a spot called the fair grounds, where periodical fairs, generally annual ones, are held. There is a race course here also.—The streets of New Orleans, in width, length, and general appearance, are second to those of no city of its size. As far back as Claiborne street, those running in general parallelism with the river and with each other present an unbroken line from the lower to the upper limits of the city, a distance of about 12 m. Those at right angles to them, or rather to the levee, run from the Mississippi toward the lake with more regularity than might be expected from the very sinuous course of the river. Claiborne, Rampart, St. Charles, Elysian-fields, Esplanade, and Canal streets are about 200 ft. wide, with a banquette or sidewalk about 12 ft. wide on each side, a central portion 25 ft. wide bordered on each side by a row of trees and a sidewalk of ample width, and a wide road between this central ground and each of the main banquettes. On the central portion railroad tracks are laid for several lines of street cars. In Canal street there are many very fine stores and some fine private residences. A number of streets are substantially paved with oblong granite blocks about a foot square by two feet long. Some of them are shelled, and afford very pleasant driving; but many are unpaved and in very wet weather scarcely available, and in dry weather intolerably dusty. Some of the finest streets in the city are in this condition, as Jackson street, and St. Charles street in the greater length of its upper portion. There are ten public squares in the city, counting as such Tivoli circle and the polyhedral oblong Coliseum place. With the exception of Jackson

square and Douglas square, which are highly cultivated and well kept, trees and lawns constitute the only horticultural cultivation these squares exhibit. Most of them are enclosed with iron railings, but some are barely more than in embryo. In Lafayette square a fine white marble statue of Franklin, of life size, executed by Hiram Powers, has been erected. A colossal bronze statue of Henry Clay, by Hart, in Canal street, and that of Jackson in Jackson square, are the only others in the city. All parts are traversed by street railroads, extending in all directions between the river and the ridge, from the upper to the lower line of the city. There are over 20 lines, all of which, with one exception, have one terminus in Canal street.—Chief among the public buildings is the custom house, in which are also the United States marshal's office and the post office. It was commenced 27 years ago, and is an extensive and solid structure, covering a whole square, and built of massive blocks of granite, with immense pillars of white marble and heavy iron staircases, and other fittings correspondingly substantial. The post office, the fitting up of which has lately been completed, is one of the most elegant and commodious in the country. The St. Charles hotel, covering half a square, surpasses the custom house in elegance of front and of entrance, with its spacious balcony and portico, lofty and handsome Corinthian pillars, and large and tasteful rotunda. The city hall, situated in St. Charles street, opposite Lafayette square, is perhaps the most artistic of the public buildings of the city. It is in the Ionic order, principally of marble, with a wide and high flight of steps leading to an elegant portico supported by eight columns. The mint is in the Ionic order, covering about the same area as the city hall, but not so handsome. No coining has been done there since the war, but congress has taken steps to recommence operations. The United States assistant treasurer has his office there. The view presented by the St. Louis cathedral, and the adjacent court buildings, with Jackson square, the open levee, the river, and the country on the right bank in front of them, and the handsome row of Pontalba buildings on each of the other sides of the square, which is beautifully adorned with evergreen shrubbery and flowering plants, with the fine equestrian statue of Andrew Jackson by Mills, and with well kept shell walks, is one of the most interesting afforded in New Orleans. There are many fine churches, some yet unfinished, one of which, a Catholic church in Common street, promises to be one of the most substantial and beautiful in the city. The Catholic church of St. John the Baptist, on Dryades street, between Calliope and Clio streets, which was opened in 1872, is a very elegant building. Another new place of worship worthy of note is the synagogue of Reformed Israelites, called the Temple Sinai, in Carondelet street. Parti-colored bricks and pointing give its walls a light airy appearance,

and it has a handsome portico, flanked by two towers capped with tinted cupolas. The Gothic windows are filled with beautifully stained glass. The old Gothic St. Louis cathedral, originally built by Don Andres Almonaster y Roxas, burned, and rebuilt in 1850, has often been described and represented. It has an imposing façade surmounted by a lofty steeple and flanked by two towers, each surmounted by a smaller steeple. Among the others worthy of note is the Jesuits' church of the Immaculate Conception with a college attached, in Baronne street, at the corner of Common; St. Patrick's church, in Camp street; the first Presbyterian church, in Lafayette square; St. Alphonsus Catholic church, in Constance street; and Trinity church (Episcopal), in Jackson street, which has lately been much improved and repaired. There are 33 cemeteries, about one sixth of which are within the inhabited limits of the city; three are Jewish, one is masonic, and one odd fellows'. A number are situated in Canal street, near Metairie ridge, and on this ridge adjacent. The old Metairie race course has lately been purchased and joined to them, and promises to become one of the most beautiful in the country. Those without the limits of the city are all more or less beautified with magnolia, cypress, willow, and other trees, and with a variety of flowering plants. The great peculiarity of these cemeteries is that, from the nature of the soil, which is almost semi-fluid at a depth of 2 or 3 ft., all the tombs are above ground. Some of these are very costly and beautiful structures of marble, iron &c.; but the great majority consist of cells, superimposed on each other, generally to the height of 7 or 8 ft. Each cell is only large enough to receive the coffin, and is hermetically bricked up at its narrow entrance as soon as the funeral rites have been performed. In most instances a marble tablet appropriately inscribed is placed over the brickwork by which the vault (or oven as it is called by many) is closed. It is a general custom to visit the cemeteries on All Saints' and All Souls' days (Nov. 1 and 2) every year, and to have the tombs decked with flowers, garlands, immortelles, and other tributes to the memory of the dead. Near the Battle monument, in St. Bernard parish, a national cemetery, wherein lie remains of deceased soldiers of the Union, has been established.—New Orleans has been known ever since its foundation to have suffered much from febrile diseases, and especially from yellow fever. Sauvolle, brother of Iberville and Bienville, founders of the city, died of *la fièvre*; and numbers of colonists and troops died of *les maladies de l'été* (summer diseases of febrile character). The distinction of these from yellow fever has been argued, but by no means proved. Apart from yellow fever, however, the healthfulness of New Orleans is not surpassed by that of any large city; and including all risks, the natives and thoroughly acclimated residents

compare favorably with those of any other community in respect of health or longevity. Yellow fever prevailed with some severity in 1799, and has repeatedly ravaged the city during the present century. Some of the most memorable epidemics were those of 1819, '22, '29, '33, '35, '37, '39, '41, '43, '47, '53, '58, and '67. Even in the most fatal seasons the natives and older residents have been to a great extent exempted, most of the mortality occurring among strangers and foreigners.—The population of New Orleans has increased with great rapidity. In 1769 it was 3,190; in 1785, 4,980; in 1788, 5,331; and in 1797, 8,056. According to the federal censuses it has been as follows: 1810, 17,243; 1820, 27,176; 1830, 46,310; 1840, 102,193; 1850, 116,375; 1860, 168,675; 1870, 191,418, of whom 50,456 were colored and 48,475 foreigners. In 1875 the number of inhabitants was estimated by local authorities at more than 210,000. Of the total inhabitants in 1870, 90,279 were males and 101,139 females; there were 25,941 males and 28,657 females between the ages of 5 and 18, and 47,737 males 21 years old and upward, of whom 38,586 were citizens. Of the foreigners, 17,361 were born in Great Britain (of whom 14,693 were natives of Ireland), 15,239 in Germany, 8,845 in France, 1,571 in Italy, 960 in Spain, 936 in Cuba, 668 in Switzerland, and 593 in the West Indies, exclusive of Cuba. There were 39,139 families and 33,656 dwellings. Of the total population, 28,063 attended school, of whom 945 were foreign born and 5,025 were colored. There were 28,109 persons 10 years old and upward who could not read, and 31,826 who could not write, of whom 5,450 were foreigners, 6,915 white, and 24,884 colored. Of 66,092 persons 10 years old and upward engaged in all occupations, 31,235 were employed in personal and professional pursuits, 17,404 in trade and transportation, 16,074 in manufactures, mechanical and mining industries, and 1,319 in agriculture. Since 1870 the births have averaged about 4,480 per annum, and the marriages about 1,860. The deaths in 1867 numbered 9,580; in 1868, 4,838; in 1869, 5,593; in 1870, 6,943; in 1871, 5,595; in 1872, 6,122; in 1873, 7,505; in 1874, 6,798.—There are three railroads connecting with northern, eastern, and western roads, running from New Orleans: the New Orleans, Jackson, and Great Northern, by Jackson and Canton, Miss., Grand Junction, Tenn., and Cairo, Ill.; the New Orleans and Mobile, by Les Petites Coquilles, a bridge over the Rigolets, the watering places on Lake Borgne, and Mississippi sound, Mobile, and roads running thence; and Morgan's Louisiana and Texas (formerly the Opelousas), crossing by ferry to Algiers, and running thence to Brashear, on the Atchafalaya. There are also a railroad to Donaldsonville, crossing the river by ferry and running up the left bank; and the Pontchartrain railroad, running to the lake and connecting by a boat with Madisonville,

Mandeville, Covington, and adjacent points on the lake. There are steamship lines running to Havana by Florida ports, to Baltimore *via* Havana and Key West, to Philadelphia *via* Havana, to Florida, to New York (several lines), to Boston, to Texas ports, to Vera Cruz, to Liverpool (several lines), to Havre, and to Bremen; and others, including one to Rio de Janeiro, are about being established. Including those of the railroads and that of the "Slaughter-house Company," seven ferry boats cross the river at short intervals to and from various points on the respective banks of the river. Among late improvements on the levee is a line of sugar sheds, affording protection to dealers in that staple. These, with 26 cotton presses, 20 cotton pickeries, 40 cotton brokers, 20 cotton buyers, and over 100 cotton factors, with their various employees and servitors, suggest the origin and ramifications of the chief industries of New Orleans. The customs district, of which New Orleans is the port of entry, embraces nearly the entire valley of the Mississippi, with ports of delivery at various points. The direct foreign commerce of a large extent of country accordingly is transacted through this port. In the value of its exports and of its entire foreign commerce it ranks next to New York, though several ports surpass it in the value of imports. The entire sugar and rice crops of the state are brought here for shipment, while the cotton crop of Louisiana, most of that of Mississippi, and much from Arkansas and Texas, are likewise brought here, making New Orleans the first cotton market in the country. The number of entrances in the foreign trade for the year ending June 30, 1874, was 840, of 630,940 tons; clearances, 855, of 658,513 tons; belonging to the port, 574 vessels, of 91,768 tons, of which 30, of 19,824 tons, were sea-going, and 150, of 37,201 tons, river steamers; entrances in the coastwise trade the previous year, 472, of 300,879 tons; clearances, 533, of 300,104 tons. The value of imports and exports from and to foreign countries for the eight years ending June 30, 1874, has been as follows:

YEARS.	Imports.	Exports.
1866-'67.....	\$11,142,249	\$85,426,851
1867-'68.....	11,386,858	60,175,896
1868-'69.....	11,414,898	75,590,224
1869-'70.....	14,993,754	108,147,847
1870-'71.....	19,427,288	95,246,791
1871-'72.....	18,542,188	90,802,849
1872-'73.....	19,933,344	104,598,732
1873-'74.....	14,583,864	98,715,710

The sugar product from 1870' shows an annual decrease in quantity and value, but more serious decrease has been felt at other periods. Between 1834 and 1861 the yield varied from 30,000,000 lbs., valued at \$2,700,000, in 1835, to 528,321,500 lbs., valued at \$25,095,271, in 1861; during the civil war it fell to 10,780,000 lbs., valued at \$1,994,300. The product and value for four years have been as follows:

1870, 168,878,592 lbs., \$14,260,636; 1871, 146,906,125 lbs., \$12,487,020; 1872, 125,346,493 lbs., \$10,027,717; 1873, 103,241,119 lbs., \$8,122,575. Similar fluctuations are noticed in the statistics of cotton from 1860 to 1874:

YEARS.	Receipts, bales.	Value.	YEARS.	Receipts, bales.	Value.
1860-'61.	1,849,312	\$92,465,600	1867-'68.	668,395	\$68,510,487
1861-'62.	88,800	1,769,040	1868-'69.	841,216	98,825,025
1862-'63.	22,078	5,107,082	1869-'70.	1,207,333	120,129,633
1863-'64.	131,044	46,677,872	1870-'71.	1,548,136	101,015,574
1864-'65.	271,015	73,820,398	1871-'72.	1,067,011	94,430,473
1865-'66.	787,386	140,312,185	1872-'73.	1,382,958	116,163,472
1866-'67.	780,490	97,629,299	1873-'74.	1,322,106	94,580,000

The rice crop shows on the whole a very large increase during the seven years from 1867 to 1874; the yearly product has been as follows:

YEARS.	Bbls.	YEARS.	Bbls.
1867-'68.	21,663	1871-'72.	29,973
1868-'69.	29,960	1872-'73.	52,206
1869-'70.	57,956	1873-'74.	96,546
1870-'71.	87,585		

In corn there has been an effort of late years to create a large foreign trade, which has met with fair success. The exports to transatlantic ports in 1873-'74 were, according to one authority, 1,034,348 bushels, against 695,925 in 1872-'73. The total value of the principal articles received from the interior from 1863-'74 to 1873-'74 is shown in the following table:

YEARS.	Value.	YEARS.	Value.
1863-'64.	\$79,233,948	1869-'70.	\$200,820,496
1864-'65.	113,549,285	1870-'71.	170,100,414
1865-'66.	201,722,179	1871-'72.	169,756,667
1866-'67.	168,343,569	1872-'73.	140,000,000
1867-'68.	127,459,561	1873-'74.	170,000,000
1868-'69.	167,559,658		

The receipts of leading articles for 1872-'73 and 1873-'74 were as follows:

ARTICLES.	1872-'73.	1873-'74.
Apples, bbls. and boxes.	113,984	74,293
Bacon, casks and hhds.	40,335	27,985
Bacon, boxes.	10,933	7,915
Bacon, hams, tcs.	20,401	18,578
Green meat, hhds.	11,748	8,349
Green meat, boxes.	3,551	3,076
Meats, lbs. in bulk.	1,459,208	2,378,974
Bagging, pieces.	7,409	8,960
Butter, firkins and kegs.	32,152	22,344
Bran, sacks.	191,830	117,373
Beef, bbls. and tcs.	6,769	9,374
Cotton seed, sacks.	839,738	908,993
Cheese, boxes.	52,330	38,231
Candles, boxes.	61,797	54,630
Coal, bushels.	5,841,264	4,943,406
Corn, bushels.	1,877,910	1,433,472
Corn, sacks.	1,384,127	1,316,236
Corn meal, bbls.	151,465	169,373
Flour, bbls.	1,046,124	1,001,504
Hides.	439,522	376,073
Hay, bales.	165,693	152,050
Lard, tcs.	50,257	31,683
Lard, kegs.	55,669	39,536
Lime, bbls. western.	49,905	44,935
Malt, sacks.	55,721	62,602
Molasses, bbls.	150,640	151,531
Molasses, half bbls.	5,340	5,262

ARTICLES.	1872-'73.	1873-'74.
Oats, sacks.	559,513	466,372
Onions, bbls.	26,260	15,081
Oils, cases.	16,788	12,636
Oils, bbls.	23,203	28,663
Oil cake, sacks.	98,528	70,479
Potatoes, bbls.	201,597	176,420
Pork, bbls.	101,324	76,427

Whiskey, bbls.	33,559	27,069
Wool, sacks.	12,972	14,080
Wheat, bushels, in bulk.	None.	323,052

The manufactures of the city are not extensive. According to the census of 1870, the parish of Orleans contained 911 manufacturing establishments, employing 517 steam engines and 5,640 hands; capital invested, \$5,751,985; amount of wages paid during the year, \$2,554,554; value of materials used, \$4,566,543; of products, \$9,980,278. The principal manufacturing in 1875 were 5 of cotton-seed oil, 8 of sirup and cordial, 7 of tobacco, 3 of fertilizers, 3 of vinegar, 13 of soap, 5 sugar refineries, 5 distilleries, and 15 breweries. There were also 3 gas companies, 2 ice-manufacturing companies, 5 dry-dock companies or firms, 42 insurance companies, 23 banking institutions, 5 tow-boat companies, and 24 custom-house warehouses, arranged in four classes. —For municipal purposes the city is divided into seven districts, Algiers constituting the fifth, Carrollton the seventh, and the rest of the territory on the left bank the other five. It forms part of the first two congressional districts of the state, and for state legislative purposes is divided into 17 representative districts (in some cases with adjacent parishes)

and 6 senatorial districts. The government of the city is administered by a mayor and seven administrators (of finance, commerce, accounts, water works and public buildings, assessments, improvements, and police, respectively) elected by the people for two years. The salary of the mayor is \$7,000 a year, that of each of the administrators \$6,000. Two coroners are elected for the same period, one serving in the districts below Canal street, the other in those above it (Algiers, or the fifth district, being included in the upper), at a salary of \$5,000 and \$7,000 each, respectively. There is no city police proper, but a body called metropolitan police, which is virtually a state militia police or state police militia, under the command of the governor, includes in its duties those of policing the city. Its organization is controlled by a board of police commissioners, five in number, appointed by the governor, and having for its president *ex officio* the lieutenant governor, and the city administrator of police as a member *ex officio*. The board appoints a superintendent, who ordinarily commands the force. A portion of the body is regularly mounted on suburban duty, and another portion is devoted to harbor duty. The annual expenditure for the body is about \$260,000. A fire alarm and police telegraph is under the control of the police board. All police expenses are paid by a city tax. There are ten police stations in which persons arrested are confined until examination. There are five municipal, police, or recorders' courts, in which minor offences are disposed of, and others sent before higher courts. Of the least grave of these the first district court has cognizance; the superior criminal court of the more heinous ones. Minor offenders are confined in the workhouse, others in the parish prison, and convicted felons are sent to the state penitentiary in Baton Rouge. Capital punishments are carried out in the parish prison. The recorders are appointed by the governor, are paid by the city \$2,500 per annum each, and have to remit to the city all fines levied. The judges of the district courts receive a salary from the state each of \$5,000 per annum, except the judge of the superior district court, who is paid \$7,500. The civil administration of justice in cases involving less than \$100 is effected through eight courts held by justices of the peace, two in the first district and one in each of the other districts of the city. For amounts above \$100 there are six district courts, all sitting in the same building, adjacent to the St. Louis cathedral. The judges and clerks of these courts are elected by the people for four years. The state supreme court sits in New Orleans from November to May, in a building contiguous to the St. Louis cathedral. The United States district and circuit courts sit in the custom house. The fire department is an extensive and influential organization. The city contracts with it for the extinction of all fires, which costs about \$160,000 a year. This is all

devoted to the general expenses of the association, the support of widows and orphans, the purchase of engines, horses, hose, carriages, and other apparatus, and the erection and repair of engine houses, &c. The members of the association, with the exception of the engineers, housekeepers, and hostlers, give their services voluntarily. There are 18 engine companies, all of whom have fine steam engines, besides four hook and ladder companies. Fire alarms, for which there are more than 100 stations, indicate the precise locality of the station from which they are sent. The fire departments in Jefferson, Algiers, and Carrollton are separate organizations, and have nine engines, several of which are hand machines.—The water of the Mississippi was introduced into the city for domestic uses in 1836. In 1868 the city assumed its reserved right of purchasing the works, paying for them \$1,300,000 in city bonds. They are situated a mile and a half above Canal street, about 200 yards from the river. About 11,000 hydrants and 12,000 fire plugs are attached to them; but many of the former are cut off from supply in consequence of inability or unwillingness to pay the rates charged for water by the city. These are \$12 per annum for each family of four, and \$1 additional for each additional inmate. Most of the dwellings are also provided with large cisterns for rain water. According to the census of 1870, the assessed value of real and personal estate (which in 1860, before the recent additions to the city's jurisdiction, was computed at \$125,284,305) was \$146,718,888; its true value, \$185,625,187. The total taxation not national was \$4,191,417, of which \$3,050,000 was imposed by the parish, and \$1,141,417 by the state. The public debt of the city was stated to be \$26,500,000. The state assessment rolls for 1874 show a taxation of \$1,986,082 52.—Near Jackson square are the several buildings constituting the French market. Their extent and antique appearance, the abundance and varied character of their supplies, the number of various races seen, and the Babel of languages heard there, have given this market a world-wide fame, which it still deserves. There are 20 other markets, several of which are noteworthy for their neatness, substantiality, and commodiousness. They are farmed out by the year to the highest bidders, who reimburse themselves by the rents of stalls. For 1875 they yielded to the city about \$260,000. Besides these public markets there were three wholesale and about 80 private ones, the latter of which a late act of the legislature prohibited. The former transact their business at the abattoir, constructed by a corporate company styled "The Crescent City Live Stock Landing and Slaughter-house Company," on a property 240 acres in extent. It is situated on the left river bank adjacent to the lower line of the city. The establishment comprises two cattle-landing wharves; 12 covered cattle pens, each having

an area of over 1,000 sq. ft.; 28 open pens, each with an area of about 1,125 sq. ft.; 18 other pens for sheep, hogs, &c.; two receiving pens, each of an area of 600 sq. ft., for cattle immediately to be slaughtered; a slaughter house for cattle in 22 divisions, each of an area of 800 sq. ft.; a slaughter house for smaller animals well supplied with hot as well as cold water, and covering an area of 21,200 sq. ft.; and 22 stables. These buildings are separated from each other by wide and well constructed causeways, and are lofty and airy. Attached to them are two steam engines by which a plentiful supply of water is commanded and the fluid offal is pumped off, covered hide vats, an apparatus for the rapid curing of hides, and a Barbarin patent gas apparatus for lighting the whole establishment. Several dwellings and other buildings are also comprised within the property of the slaughter-house company. The average number of cattle slaughtered is about 1,000 a day in winter and about 700 in summer. The slaughtering of any of these animals elsewhere within the city limits is prohibited by law. An inspector, appointed by the governor, examines all cattle killed and certifies to their fitness for food.—The Howard association is one of the most prominent charitable bodies in the world, in view of the wide extent of its operations, the immense amounts it has disbursed, and the vast number of patients it has succored. Its special mission has been to labor for the relief of sufferers in epidemics, particularly of yellow fever and cholera. In these cases its operations have extended to every city and district in the south which has been afflicted. In seasons of epidemic infliction it has been the depository of contributions from all parts of the country as well as from the citizens of New Orleans. The hospitals, infirmaries, and asylums in the city are some 55 in number. Prominent among them are the Hôtel-Dieu and Charity, Luzenberg, and smallpox hospitals; the Orleans, Touro, and Circus street infirmaries; the Jewish widows' and orphans' home; and the John McDonogh asylum. The Charity hospital, founded by Don Andres Almonaster y Roxas in 1784, is widely known. It has stood on its present site, in Common street, since 1832, affording a refuge to an average of 500 or 600 patients in ordinary seasons, and to nearly or quite double the number in others. Its domestic management is in the hands of the sisters of charity. It depends almost or entirely upon state appropriations, and hitherto has been well supported. The Hôtel-Dieu, half a mile further back from the river, is a very fine hospital established by the sisters of charity, and supported entirely by receipts from patients, some of whom are nevertheless beneficiary. It occupies a full square, and is surrounded by a well kept garden of shrubbery and flowers. Other prominent institutions are the Poydras female orphan asylum, in Magazine street, in the sixth district, the St. Anna's

widows' asylum, the St. Vincent's orphan asylums, the indigent colored orphan asylum, the convent de la Sainte Famille for colored widows, and the German Protestant asylum. The Touro almshouse, founded by Judah Touro, was burned during the civil war by colored troops who had occupied it. Unsuccessful efforts have been made to induce congress to grant an appropriation for the restoration of the buildings. Besides the relief afforded through the various channels already noticed, much more is derived from the freemasons, odd fellows, and numerous similar societies.—To almost all the churches Sunday schools are attached, and a large proportion of them have also regular day schools connected with them. The Catholic church schools are very largely attended, the charges being very low, and in many cases entirely remitted. The public schools in the city are under state control, although the city is called upon to pay the taxes by which they are supported, amounting at present to \$360,000 a year. The state board of education, consisting of the state superintendent and six division superintendents, appointed by the governor on the state superintendent's recommendation, elect 18 directors for the city, who choose the assistant superintendent, secretary, assistant secretary, teachers, porters, &c. There are nearly 80 schools, including one boys' high school and two girls' high schools. The other schools are of five grades. There are employed on the average 425 teachers, of whom about nine tenths are females. The salaries vary from \$2,400 a year for the principal and \$1,500 for associates in the boys' high school, to an average of \$766 for teachers in the lowest grade. Teachers in the first grade of grammar schools get \$1,500. There are very few private schools of any importance except those attached to religious bodies, and the great majority of others are for young ladies. The Peabody normal institute is supported from a fund bequeathed for such purposes by George Peabody. The Straight university, founded by Mr. Seymour Straight, is exclusively for colored students. It has a corps of six teachers and an average attendance of 100 students. Its instruction is of good grammar school grade. There are separate schools, both public and private, for colored pupils; and a few colored pupils have been admitted into some of the public schools which are nominally exclusively attended by white pupils. Yet the general opposition to "mixed schools" is very deep-seated and resolute in the minds of the white population. The "Agricultural and Mechanical College," founded under a congressional grant of scrip for over 200,000 acres of land, opened in May, 1874, is a thoroughly "mixed school." As yet nothing has been taught in practical agriculture or mechanics. It has been established in one of the university buildings in the city, and has a professor of mathematics, a professor of chemistry, a tutor in mechanical drawing, and a tutor in modern languages and

history. The board of control have taken steps for a permanent location of the college at Chalmette, St. Bernard parish, on land belonging to the state, to be added to by the purchase of adjacent property on which there are suitable buildings. They report in January, 1875, actual assets to the amount of \$240,300 77, and further contingent assets to the amount of \$170,800, making a total of \$411,100 77. The state university comprises only two departments, law and medicine, but both of these are of very high order, and are very largely patronized, especially the medical department, which during the past several years has had an annual average of nearly 200 students and of about 65 graduates. The state constitution requires a literary department to be connected with the university, but the legislature has hitherto neglected to provide for it. Children are sent to Virginia, to the north, or to Europe for a higher education. A dental college exists, but has not many students. There are four commercial colleges. There is an academy of sciences, founded in 1853, but it has suffered from lack of encouragement and support. To some of the educational establishments there are libraries attached, as to the Straight university and the boys' high school; but these are very limited in extent and character. There is a library belonging to the city and another to the state, which are still respectable, but very far from what they have been. The state library was removed and greatly damaged by neglect and pilfering during the war. Some of the clubs of the city have small libraries. There are a few good private libraries, but they have shared the common fate.—There are about 20 clubs in the city, prominent among which are the Boston, the Pickwick, the Shakespeare, and the Jockey clubs. The Jockey club has a beautiful house and highly decorated and cultivated grounds, on property purchased from the fair grounds. The Shakespeare club gives occasional dramatic performances which are always largely and fashionably attended. The existing theatres properly so called are the St. Charles, the Varieties, the academy of music, the opera house, and the National or Globe. Of these, the St. Charles and the academy are the only two which have been able to continue in operation with success during the late unprosperous times. Besides the theatres there are a score or more of halls in which entertainments of various kinds are given. The principal of these are the masonic hall in St. Charles street, odd fellows' hall and St. Patrick's hall in Camp street, opposite Lafayette square, exposition hall in St. Charles street, and Grünewald hall in Baronne street, between Canal street and the university buildings. The lyceum hall in the city hall, which was built for such purposes, has been transformed into public offices. Among the societies which have been formed for the purpose of festival celebrations are that known as the "King of

the Carnival" or "Rex," in which an effort was made to merge all others, the "Mistick Krewe of Comus," the "Twelfth Night Revelers," and the "Knights of Momus." From Christmas to Lent these various associations give entertainments and processions through the streets, with a gaiety and universal enjoyment unequalled elsewhere in the United States, and culminating in a display of profusion and *abandon* on Mardi gras or Shrove Tuesday which have made them widely famous.—There are in New Orleans 7 daily (1 French and 1 German), 1 semi-weekly, and 12 weekly newspapers, besides a monthly and a bi-monthly periodical. The number of churches is 142, viz.: Baptist, 22; Congregational, 8; Episcopal, 12; Evangelical Protestant, 5; Jewish, 6; Lutheran, 4; Methodist Episcopal, 22; Methodist Episcopal, South, 11; Presbyterian, 12; Roman Catholic, 38; Swedenborgian, 1; Unitarian, 1.—The site of New Orleans was surveyed in 1717 by De la Tour; it was settled on in 1718, but abandoned in consequence of overflows, storms, and sickness; resettled in 1723, held by the French till 1769, then by the Spanish till 1801, and by the French again till 1803, when, with the state, it was ceded to the United States. It was incorporated in 1804, and in 1836 it was divided into three municipalities, each with a separate government; but in 1852 these municipalities were consolidated, and the limits of the corporation were extended to include the town of Lafayette, lying in the adjacent parish of Jefferson. In 1870 (before the census) Algiers was included within the city limits, and by the same act the corporation was extended over the entire parish of Orleans on the left bank, except Les Petites Coquilles, which are said to have been omitted through a misapprehension in regard to the legal boundaries of the parish. The city of Jefferson, Jefferson parish, was also annexed by this act, and in 1874 Carrollton was added from the same parish. New Orleans was made the capital of the state by the constitution of 1868. The most memorable event in the history of New Orleans, from its transfer to the United States to the breaking out of the civil war, was the battle on Jan. 8, 1815, for an account of which see JACKSON, ANDREW. The battle was fought on the plains of Chalmette in the parish of St. Bernard, 4 m. from the city, where stands an unfinished marble monument.—New Orleans, being the largest city of the south, its principal shipping port, and the commercial entrepot of the valley of the Mississippi, was of great importance during the first two years of the civil war. Its population mainly sympathized with the movement for secession, and directly after the passage of the South Carolina ordinance the city came practically into the hands of the state authorities, who took possession of the forts below, which commanded the passage of the Mississippi, and on Feb. 1, 1861, seized the United States mint and custom house; and soon after

the city was occupied by a considerable confederate force. Plans for its recapture were at once formed by the federal government; but the first definite action took place in February, 1862, when a combined naval and military force, under Commodore Farragut and Gen. Butler, was sent thither. The main obstacle to its advance was Forts Jackson and St. Philip, on opposite banks of the Mississippi, about 83 m. below New Orleans. They were supposed to be very strong, and there was a considerable fleet stationed above them; but on April 24 Farragut succeeded in passing the forts and destroying the vessels above. Passing up the river, he met little opposition, and reached New Orleans, which was entirely commanded by his fleet. He then demanded the formal surrender of the city. The confederate military force had been withdrawn, and the civil officers declared that they had no authority to make a formal surrender; but it was agreed that Farragut should take peaceful possession. In the mean while the forts below, which Farragut had merely passed, were given up, and on May 1 Butler took formal possession of New Orleans as military governor. He ruled the city with great vigor until Dec. 14, when he was superseded by Gen. Banks. Since the close of the war the city has been the scene of several disturbances, growing mainly out of the conflicting pretensions of the two parties claiming to be the legal authorities of the state of Louisiana.

NEW PHILIPPINES. See CAROLINE ISLANDS.

NEWPORT, a S. E. county of Rhode Island, consisting of a small portion of the mainland

and several islands, including Rhode, Canonicut, and Prudence islands in Narragansett bay, and Block island, S. W. of it; area, 136 sq. m.; pop. in 1870, 20,050. It has an undulating surface and a generally fertile soil, and contains large quantities of coal. The Old Colony railroad terminates in Newport. The chief productions in 1870 were 92,975 bushels of Indian corn, 76,980 of oats, 16,661 of barley, 92,878 of potatoes, 39,044 lbs. of wool, 266,775 of butter, and 17,229 tons of hay. There were 1,426 horses, 3,659 milch cows, 1,620 working oxen, 2,007 other cattle, 19,930 sheep, and 2,615 swine. The total number of manufacturing establishments was 184, with a capital of \$993,350, and annual products amounting to \$2,346,232. The most important were 1 copper-smelting establishment, 2 manufactories of cotton goods, 3 of furniture, 1 of cotton and woollen machinery, 6 of brick and stone, 10 of fish oil, 5 of tin, copper, and sheet-iron ware, 3 of upholstery, 14 flour mills, and 13 ship yards. Capital, Newport.

NEWPORT, one of the capitals of the state of Rhode Island, on the W. shore of Rhode island, and on Narragansett bay, 5 m. from the ocean, and 22 m. S. S. E. of Providence, in lat. 41° 29' N., lon. 71° 19' 12" W.; pop. in 1870, 12,521. It is a port of entry, and has a fine harbor, which may be entered at all times without a pilot, and is safe, commodious, and deep enough for the largest ships. It is defended by Fort Adams on Brenton's point. The city is on a declivity facing the harbor, and contains a state house, custom house, city hall, the Redwood library with 20,000 vol-

Newport.

umes, the People's library (free) with 15,000 volumes, the masonic hall, armory hall, and numerous elegant private residences. Its salubrious climate, refreshing ocean breezes, facilities for sea bathing, and charming natural scenery have rendered it one of the most

popular summer resorts in the United States, and the visitors during the fashionable season are numbered by thousands. The whole S. portion of the island is now dotted over with villas, and there are several large hotels. The older part of the city is interesting for its quaint

and picturesque appearance. The "old stone mill," whose origin and purpose were once a theme of much learned discussion, and which is still asserted by some antiquaries to have been built by the Northmen 500 years before the arrival of Columbus; the ruined Fort

Old Mill, Newport.

Louis, at the entrance of the harbor, and its surrounding rocks, called "the Dumpings;" Fort Adams, one of the most costly and extensive fortifications in the Union; the "Purgatory Rocks" and "Hanging Rocks;" the "Spouting Cave," and "the Glen," are the principal objects of interest. The beaches are excellent for bathing, and for promenades at low tide. Bellevue avenue, 2 m. long, and lined with villas, is at fashionable hours crowded with elegant equipages; and a fine drive, called the "Ocean drive," has lately been laid out along the southern shore of the island. A favorite resort is Touro park, given to the town by Judah Touro, who was born here. The Jewish cemetery and synagogue are still carefully preserved through bequests left by him, although there are now no Jews to use them. The commerce of Newport is now very limited, and its manufactures are almost confined to a few cotton mills, a brass foundry, and lead works. The value of imports for the year ending June 30, 1874, was \$11,135; of exports, \$19,544; vessels belonging in the district on that date, 135, tonnage 8,660. The city is connected with Boston by the Old Colony railroad, and daily steamers from New York to Fall River, Mass., touch here.—Newport was

settled in 1638 by 17 colonists from Roger Williams's party, headed by William Coddington. The settlers were early distinguished for their enterprise as merchants and navigators, and for their activity in the whaling business. As early as 1764 their trade with the West Indies employed 150 vessels, and 14,000 hhd. of molasses were annually imported, to be converted into rum for the African market. Some years before the Boston tea party the British armed sloop *Liberty*, stationed here to exact an odious tax, was burned in the harbor. During the revolution 8,000 British and Hessian troops were quartered on the town, and its commercial interests have never recovered from the injury which they inflicted. They destroyed 480 houses, robbed the library, then the finest except one in America, burned the shipping, cut down all the groves and orchards for fuel, and carried off the town records. Before this period Newport had been a favorite resort of men of science and letters, and was noted for the opulence and refinement of its inhabitants. Bishop (then Dean) Berkeley resided here 2½ years, and built a house which is still standing in the adjacent town of Middletown. It was here that he composed his celebrated work, the "Minute Philosopher." Commodore O. H. Perry was born near Newport, and is buried there, with a monument to his memory. A bronze statue of his brother, Commodore M. C. Perry, a native of Newport, has lately been placed in Touro park. It is by J. Q. A. Ward, and has bass reliefs on the pedestal, representing Commodore Perry's exploits in Mexico, Japan, and elsewhere.

NEWPORT, a city of Campbell co., Kentucky, on the Ohio river, immediately above the mouth of the Licking, and opposite Cincinnati, 63 m. N. N. E. of Frankfort; pop. in 1850, 5,895; in 1860, 10,046; in 1870, 15,087. It is handsomely built on an elevated plain commanding a fine view, and is ornamented and made attractive by numerous shade trees. In the city and its suburbs are a large number of elegant residences. Communication with Cincinnati is maintained by a steam ferry and a splendid new iron bridge for ordinary travel and railroad trains. There is a suspension bridge over Licking river between Newport and Covington, and a street railroad running over this bridge and the Covington and Cincinnati bridge connects the three cities. A street railroad also connects Newport with the two villages of Dayton and Bellview, situated on the Ohio river above the town. The Louisville, Cincinnati, and Lexington railroad passes through the city. It is noted for its excellent schools. There are several large rolling mills, iron foundries, saw mills, and various manufactures. The city contains a bank, a United States arsenal and military post, a daily and weekly newspaper, and ten churches. The principal courts of the county are held here.

NEWPORT. I. A municipal and parliamentary borough and market town of Monmouth-

shire, England, on the right bank of the river Usk, about 5 m. from its mouth, and 20 m. S. W. of Monmouth; pop. in 1871, 27,069. It is largely engaged in ship building, and has several iron foundries, nail works, and manufacturing of anchors, chain cables, &c. There is a dock capable of admitting large vessels. In 1872 there entered the port 2,573 British vessels, tonnage 279,159, and 363 foreign vessels, tonnage 91,429; cleared, 8,110 British vessels, tonnage 718,063, and 566 foreign vessels, tonnage 179,868. The imports of foreign and colonial merchandise were valued at £362,245, the exports at £2,233,770; the gross amount of customs duties was £51,374. The town is connected with Gloucester and Cardiff by railway, and with Pontypool by railway and the Monmouthshire canal. Of the castle of Newport, which is supposed to have been built by the earl of Gloucester, a son of Henry I., only a square tower and a part of the great hall remain. In 1839 it was the scene of the chartist insurrection for which John Frost and others were found guilty of high treason and transported for life. **II.** A municipal and parliamentary borough of Hampshire, England, in the isle of Wight, on the left bank of the river Medina, which is navigable for small vessels, 18 m. S. S. E. of Southampton; pop. in 1871, 8,522. Lace and agricultural implements are manufactured.

NEWPORT, Christopher, one of the founders of the colony at Jamestown, Va. He commanded the three vessels which carried out in 1606 the first settlers of that colony, and was one of the council appointed by the king for governing the province. After visiting Powhatan with Capt. John Smith and others, he returned to England in June, 1607. He came back the next year with supplies and 120 emigrants, chiefly goldsmiths and gentlemen, "packed hither," says Smith, "by their friends to escape ill destinies." As their object was gold, "there was no talk, no hope, no work, but dig gold, wash gold, refine gold, load gold;" and some yellow mica having been discovered near the present site of Richmond, Newport filled his vessels with it under the impression that it was gold, and carried it to England. He subsequently returned to Virginia in the fleet conveying Lord Delaware and the new charter to the colony, but was wrecked in the Bermudas, where they built a vessel with which they reached their destination. Newport's "Discoveries in America" was first published in vol. iv. of *Archæologia Americana*, in 1860.

NEW PROVIDENCE, one of the Bahama islands, near the centre of the group, and containing Nassau, the seat of government; pop. about 9,000. It is 17 m. long from E. to W., and 7 m. broad. It was colonized by the English in 1629, and twice taken from them by the Spaniards, but finally restored at the peace of 1783. It is more hilly than most of the other islands of the group, has some fertile land, and produces good fruits.

NEW ROSS, a parliamentary borough of Ireland, partly in Wexford and partly in Kilkenny county, on the Barrow, 2 m. below its junction with the Nore, 73 m. S. S. W. of Dublin; pop. in 1871, 6,738. The river, which admits vessels of 600 tons to discharge at the quay at all times of the tide, and those of 800 at high springs, is crossed by an iron bridge, with a draw. The town has a fever hospital, dispensary and lying-in hospital, union workhouse, and barracks. Above and below the town is an important salmon fishery, in which more than 800 men are employed.

NEWRY, a parliamentary borough and river port of Ireland, on the borders of the counties of Down and Armagh, on the Newry water and canal and the Dublin and Belfast junction railway, 34 m. S. W. of Belfast, and 57 m. N. of Dublin; pop. in 1871, 14,181. There are two Roman Catholic churches, one of which is the cathedral of St. Patrick, Dromore, two convents, and several Protestant churches. The chief manufactures are linen, cotton, iron, beer, and cordage; and there are numerous mills, distilleries, and potteries. Extensive water works have recently been erected. The town exports large quantities of butter, grain, and cattle. Its principal trade is with Liverpool and Glasgow, but it has also some foreign commerce. The river, which is here crossed by four stone bridges, admits vessels of 600 tons to the town and of 1,000 tons 6 m. below. The imports in 1872 were valued at £368,835, and the exports at £20,180.

NEW SOUTH WALES, a British colony occupying the S. E. part of Australia, stretching along the S. Pacific ocean from Cape Howe to Point Danger, bounded N. by the colony of Queensland, E. by the Pacific, S. by the colony of Victoria, and W. by the interior territory of the colony of South Australia. It extends between lat. 28° and 37° 30' S., and lon. 141° and 154° E. Its greatest length, E. and W., is about 780 m.; greatest breadth, N. and S., 620 m. The area, according to an official statement, is 323,437 sq. m.; according to a planimetric calculation, believed to be more correct, 308,560. The population according to the census of April 2, 1871, was 503,981; on Jan. 1, 1873, it was officially computed at 539,190. The colony of Queensland, extending from lat. 26° to 30° S., was formerly the Moreton Bay district of New South Wales, and was separated from the latter colony in June, 1859. In 1873 New South Wales was divided into 118 counties, of which 20, which have been settled a long time, are called the old counties; the others, called the new counties, are principally in the interior.—The coast line presents in general bold perpendicular cliffs of sandstone, occasionally interrupted by low sandy beaches, some of which stretch a considerable distance inland, and appear to have been covered by the sea at no very remote period. There are numerous indentations along the shore, some of which form excellent harbors. The most

important are Port Stephens, Port Hunter, Port Jackson, Botany bay, Jervis bay, and Twofold bay.—The principal ranges of mountains are the interior ranges, the great dividing chain, and the coast ranges. The former lie near the western boundary of the colony, and form the western watershed of the Darling river; the loftiest elevation is Arrowsmith, 2,000 ft. The great dividing chain extends throughout the whole length of the E. and S. E. coasts of Australia, and forms the main watershed of the country. It consists of seven main branches, viz.: the New England range, highest point Ben Lomond, 5,000 ft.; the Liverpool range, highest point Oxley's peak, 4,500 ft.; the Blue mountain, Cullarin, Gourock, and Maneroo ranges; and the Muniong range, highest point Kosciusko, 7,176 ft. All this series is connected with the Cordillera, dividing the E. and W. watersheds. The coast ranges lie E. of the great dividing chain, and parallel to it for a considerable distance. They generally form the edge of the elevated table land upon which lies the great dividing chain. The loftiest peak is Mount Seaview, 6,000 ft. The space between the mountains and the sea has an undulating wooded surface, broken by spurs from the mountain range, and in some places covered with dense brushwood. The ground to the west continues rugged and mountainous for a considerable width, and at last assumes the form of an elevated plateau, a great part of which remains unexplored. Several considerable rivers rise on the W. side of the mountains, but have only the first part of their course in New South Wales. The more important are the Murray, Murrumbidgee, Lachlan, Darling, Bogan, and Macquarie. The rivers E. of the mountain range are mostly small, and many of them are dry during part of the year. The chief are the Hawkesbury, Hunter, Macleay, Shoalhaven, Clarence, and Richmond.—The prevailing rock on the E. side of the mountains is sandstone, and on the W. granite. Much of the sandstone belongs to the carboniferous system, and there are several workable seams of good coal. The Newcastle field on the Hunter river is excellent, and contains five seams, two of 5 ft. and three of 3 ft. in thickness. This field is worked extensively, and the produce, after supplying colonial demands, is shipped to India, China, and California to supply steamers. Several other fields are known, and one is worked at Wollongong. Iron ore is found in many places, and some of it is worked. Rich copper ore is abundant in and around Wellington district. Fine pebbles are so plentiful in the Hunter river that it is supposed in some part of its course to flow over rocks of jasper, agate, opal, and chalcedony. But all these were regarded as comparatively unimportant after the discovery of rich deposits of gold in May, 1851. Gold has since been found in numerous places throughout the colony, and in the territories both N. and S. of

it. Near the frontiers of Victoria, particularly in the counties of Wellesley and Wallace, it occurs in several localities; and N. of these it is met with in several other counties, and is found on the banks of the Macquarie river. There are considerable deposits about the Peel and its tributaries, and also on the Fitzroy river somewhat beyond the N. frontier. Australia being in the southern hemisphere, the seasons are the reverse of ours; December is there midsummer, and June midwinter. Summer extends over December, January, and February; and the mean heat during these three months is about 80° at noon, tempered by the sea breeze, which begins to blow regularly along the coast about 9 in the morning, and continues till evening. The whole colony is subject to hot winds, which are liable to happen three or four times during the summer, and which blow from the northwest, raising the thermometer to 125° when exposed to their influence. These winds seldom last longer than a few hours, and are succeeded by a very heavy squall from the south, generally accompanied by thunder and rain, cooling the atmosphere immediately. At Sydney the average annual temperature is 64°; that of spring being 65°, of summer 72°, of autumn 66°, and of winter 55°, showing an annual average range of the thermometer of 17°. The temperature of the country above the mountains is much lower, and at some places snow falls in winter. The annual fall of rain is 52 inches at Port Jackson, and 62 at Port Macquarie. Droughts are frequent, but the climate is both healthful and agreeable, and its influence is highly beneficial in consumptive diseases.—For 5 or 6 m. from the seacoast the country is in general barren, the soil being mostly composed of drift sand covered with a stunted vegetation. Some rich and fertile districts occur at intervals. Further inland well wooded and fertile valleys lie between the hills, but the land on the E. side of the Blue mountains is as a general rule much inferior both for agriculture and pasture to that on the W. Above the range it consists of a dry black soil, covered with open forests and luxuriant herbage. Wheat, barley, oats, rye, grasses, maize, tobacco, and small quantities of cotton, are all profitably cultivated in different parts of the colony; and potatoes, cabbage, carrots, parsnips, turnips, peas, beans, cauliflowers, lettuces, cucumbers, pumpkins, sweet potatoes, yams, and plantains thrive remarkably well. At Sydney the market is supplied with green peas all the year round; very few vegetables degenerate, and many are more productive than elsewhere. Peaches, apricots, nectarines, loquats, oranges, pears, plums, figs, pomegranates, raspberries, strawberries, mulberries, and melons attain great perfection. The N. districts produce pineapples, bananas, guavas, lemons, citrons, and various other tropical fruits, while W. and S. of Sydney the apple, currant, gooseberry, and cherry are found to grow well. In 1871, 4,152 acres were planted with the vine,

and the grapes are of the finest quality. The total number of acres under cultivation was 417,801. There were 304,100 horses, 2,014,888 horned cattle, 16,278,697 sheep, and 213,193 swine. The climate is particularly well suited to all these animals. Horses are exported in large numbers to India; horned cattle grow to an immense size; and the wool of the sheep is very superior. Asses, mules, and goats are seldom seen. The camel has been introduced for exploring purposes, but has not thriven. Llamas, alpacas, and vicuñas have been introduced. Domestic fowl of every description thrive remarkably well, and are reared at small expense. Fish are abundant on the coasts; and there is a kind of fresh-water codfish in the Murray river which weighs sometimes as much as 70 lbs. Oysters are plentiful, and turtles are procured from the N. part of the colony. Much of the soil of New South Wales is very fertile. Within a few years the improved agricultural machines have been introduced, but the attention of the colonists is still devoted chiefly to the produce of the pasture lands, wool, hides, and tallow. In 1871 the amount of wool exported was 48,700,000 lbs., valued at £4,700,000. Very superior wines are made, resembling Sauterne, Barsac, hock, and claret. In 1873 more than 200 wine presses were in operation. The chief manufactures are leather and a kind of woollen cloth called "colonial tweed," which is exceedingly durable and in high favor among the settlers. Sugar refining is carried on to a considerable extent at Sydney; and there are extensive distilleries, breweries, various sorts of mills, foundries, tallow-boiling establishments, and docks, in different places throughout the colony. The total number of manufactories of all kinds in 1872 was 6,242. The imports in that year were valued at £9,208,496, of which £3,569,559 were from the United Kingdom and the British colonies; the exports at £10,447,000, of which £3,710,000 were to the United Kingdom and British colonies, including wool to the value of £2,782,000. The exports included also gums, bark, copper ore, and timber. In 1871, 1,891 vessels of 706,019 tons entered the ports, and 2,123 of 794,460 tons cleared. Four fifths of all were under the British flag. Gold in its natural state is subject to a duty of 2s. 6d. an ounce on leaving the colony, and so appears in the custom-house returns; but the coined gold, having already paid this tax in the shape of mint charges, is allowed to pass free. Some of the imports from the neighboring colonies, the whole produce of the whale fisheries, and the greater part of what is received from the South sea, are merely transhipped in the ports of New South Wales while *in transitu* to other parts of the world. The first railway was projected in 1846, to connect Sydney with Melbourne. In 1872 the aggregate length of railways in the colony was 405 m. There are 570 post offices. Sydney is the capital; the other principal towns are East and West Maitland,

Liverpool, Bathurst, Goulburn, Windsor, Newcastle, Yass, Penrith, and Paramatta. There is a university at Sydney, with two affiliated colleges; and in 1871 the colony had 1,450 schools, with 2,089 teachers and 77,889 pupils. There is a branch of the London mint, which issues gold coin, current in all the neighboring colonies and in Mauritius, Ceylon, and Hong Kong. The public press includes three daily newspapers and several other periodicals published at Sydney, and newspapers at Maitland, Bathurst, Goulburn, and other places.—The government of New South Wales consists of a governor appointed by the crown, an executive council chosen by the governor, and two houses of legislature, one nominated by the governor and called the legislative council, and the other elected by the people and called the legislative assembly. No allowance is paid to any of these members, except to those of the ministry or executive council, which is composed of the colonial secretary, the treasurer, the postmaster general, the solicitor general, the attorney general, and the minister of lands and public works. These ministers are all required to possess seats in the house of assembly, and retain their offices only so long as they can secure a majority in this branch of the legislature. The qualifications required for a voter are that he should be a householder, or if living in lodgings that he shall be earning wages at the rate of £100 a year, and that he should have resided six months in the colony. All voters are eligible to membership. The house of assembly, composed of 72 members, makes laws within the colony not repugnant to those of Great Britain; it regulates the revenue, and makes all appropriations for the public service. Measures passed by it do not become law till they have been approved by the legislative council and the governor, who has power to dissolve the house at pleasure. The revenue is derived from import duties and miscellaneous taxes, and from the proceeds of the sale of public lands and licenses to depasture. In 1872 it amounted to £2,794,274, and the expenditures to £2,362,482. For 1874 the revenue was officially estimated at £3,168,935. The public debt on Sept. 30, 1873, amounted to £10,829,885.—According to the census of 1856, barely a third of the population of New South Wales was born in Australia; about 75,000 were supplied by England and Wales, 50,000 by Ireland, 16,000 by Scotland, 5,000 by Germany, and 2,000 by China. The population now (1874) includes a large admixture of Chinese, many Americans, and some of almost all European nationalities. From 1866 to 1872 the total number of immigrants exceeded 150,000, while about 100,000 emigrated. The emigration included 4,917 Chinese, while the number of Chinese immigrants was only 1,520. The number of births in each of the seven years from 1866 to 1872 was more than double that of the deaths, and in 1870 and 1871 it was three times as large. In appearance and character the na-

tive-born part of the community bear a strong resemblance to those of Anglo-Saxon descent in the United States. Since the establishment of the colony in 1787-'8, the total number of convicts sent into it from Great Britain up to 1840, when the importation ceased, was 54,383. Many whose progenitors came to New South Wales as prisoners are intelligent and estimable members of the community. Some of the emancipists, and several of their descendants, are among the wealthiest people in the colony. The religious division of the inhabitants in 1871 was as follows: Church of England, 229,243; Presbyterians, 49,122; Wesleyans, 36,277; Congregationalists, 9,253; Roman Catholics, 147,627; Mohammedans and other Asiatic creeds, 7,455; the remainder belonged to various minor denominations. For information concerning the aborigines, the native animals, botany, geology, and history of New South Wales, see AUSTRALIA. — See Lang's "New South Wales" (new ed., 2 vols., London, 1875).

NEWSPAPERS, printed sheets published at stated intervals, chiefly devoted to intelligence on current events. Newspapers were preceded in antiquity by the Roman *Acta Diurna*, which were daily, official, written reports of public occurrences; and in modern Europe by periodical publications in manuscript. Of the origin of newspapers in England, Alexander Andrews says ("History of British Journalism," London, 1859): "First we have the written news letter furnished to the wealthy aristocracy; then, as the craving for information spread, the ballad of news sung or recited; then the news pamphlet, more prosaically arranged; then the periodical sheet of news; and lastly the newspaper." The first regular series of weekly newspapers hitherto discovered was entitled "The Weekly Newes from Italy, Germanie, &c." (1622). The "English Mercurie of 1588," long regarded as the first printed English newspaper, was proved a forgery in 1839 and again in 1850 by Thomas Watts of the British museum. Prominently connected with most of the early weekly sheets, which appeared under the name of "Weekly Newes," "Times Newes," "Newes," &c., was Nathaniel Butter, who is regarded as the father of the regular newspaper press. The first attempt at parliamentary reporting was made in 1641; the first advertisement was inserted as early as 1648, and the first paper exclusively devoted to advertisements and shipping intelligence appeared in 1657. The news given in the papers treated chiefly of foreign affairs. Home politics were scarcely discussed till after the abolition of the star chamber in 1641. Various partisan sheets were published during the civil war, chiefly under the name of "Mercuries," and counting among their most eminent editors Needham, Birkenhead, Digby, and Heylin, the last regarded as the ablest of them all. Many of the papers were notorious for their eccentricity and coarseness, and still more for their bitterness. After the restoration the censorship of

the newspapers became more stringent. A semi-official organ, edited by Sir Roger L'Estrange, who was the licenser of the press, and held for some time a kind of monopoly of journalism, was supplanted in 1665 by the "Oxford Gazette," published during the temporary removal of the court to that city on the outbreak of the plague. On the return of the royal family to the metropolis (1666) it appeared as the "London Gazette," and, as the official organ of the government, was placed under the control of the under-secretary of state. The press was for a long time subjected to many persecutions, and the licensing act was not abolished until after the accession of William and Mary. In the mean time the first commercial newspaper, the "City Mercury," was published in 1675; the first literary paper, the "Mercurius Librarius," in 1680; the first sporting paper, the "Jockey's Intelligencer," in 1683; and the first medical paper in 1686. From that year to 1692, 26 new journals sprang into existence, including the first bearing the title of a reform paper, the "Mercurius Reformatus;" the first publication in the style of "Notes and Queries," the "Athenian Mercury;" the first ladies' paper, the "Ladies' Mercury;" the first agricultural and an increasing number of literary journals. Daily newspapers did not make their appearance until the 18th century. The first daily morning newspaper was the "Daily Courant" (1709), consisting of but one page of two columns, and containing five paragraphs translated from foreign journals. The leading London weekly journals at that time were mostly sold for a penny; supplements with the latest news commanded an extra price. Home affairs were then little discussed; foreign news supplied the staple of newspaper information, and correspondents were employed in the principal cities of Europe. In 1726 appeared the first number of the "Craftsman," which obtained for a time a circulation of nearly 12,000 copies. In 1730 200 half sheets a month were issued in London alone, besides daily and weekly journals. The aggregate number of copies of newspapers sold in England in 1757 was about 7,000,000; in 1760, 9,000,000; and in 1767, upward of 10,000,000. The "North Briton," edited by Wilkes, who was so conspicuous in consolidating the liberty of the press, first appeared in 1762. The "Englishman," established in the same year, attracted attention in 1766 on account of several of Burke's contributions. The letters of Junius began to appear in 1767 in the "Public Advertiser," and contributed powerfully to raise the political importance of the daily press. The leading daily journals of London in the latter part of the 18th century were the "Morning Chronicle" (founded in 1769), the "Morning Post" (1772), the "Morning Herald" (1781), the "Times" (1785), and the "Morning Advertiser" (1794). The "Times," destined to eclipse all other English journals, originally appeared under the name of the

"Daily Universal Register." It was printed and published by John Walter of Printing House square, who, in the impression of Jan. 1, 1788, added to the original name of his journal that of the "Times." Its circulation at the beginning of this century was only 1,000 copies a day, while that of several others was about 4,000. The "Morning Chronicle" and "Morning Post" were at this time the most important of the London journals, and both possessed great literary merit as well as political influence; Coleridge, Southey, Lamb, Wordsworth, and several of their friends writing for the "Post," while Fox and Sheridan were among the "Chronicle's" contributors. In 1813 there were 56 journals in London, of which 8 were published every morning, 7 every evening (the first evening paper having been established as early as 1778), 7 every other evening, 16 every Sunday (the first Sunday paper had appeared in 1788), and 18 weekly on other days. The "Courier" was then considered the best informed daily journal. The remarkable success of the "Times" was ascribed to a firm attitude toward the government and a freedom from party ties; to an efficient system in securing the earliest transmission of news; to a constant care in improving the mechanical resources of the paper, and in securing the best available talent; and above all to the application of steam power to its printing press in 1814, the number for Nov. 29 in that year being printed on one of König's newly invented machines. In 1815 the number of newspapers in the United Kingdom amounted to 252, viz.: 55 in London (15 daily), 122 in other parts of England and Wales, 26 in Scotland, and 49 in Ireland; and Cobbett's weekly "Political Register," established at the beginning of the century, was sold in 1817 to the extent of 50,000 copies a week. After the close of the Napoleonic wars the growth of English journalism was exceedingly rapid, and in the course of a decade the increase both in the number and circulation of newspapers was very great. On Jan. 29, 1829, the "Times" came out on a double sheet, composed of 8 pages of 48 columns. The reform excitement greatly increased the sale of that and of other journals, and nearly 13,000,000 copies of newspapers passed through the post office in 1830. In 1832 there was one newspaper to every 55,000 of the population, against one to 90,000 in 1821, and one to 110,000 in 1782. The free expression of political opinion through the press was rather increased than checked by the fact that the editors of various unstamped newspapers, among them the violent "Poor Man's Guardian," were prosecuted during the discussion on the reform bill. In 1833 the number of journals published in the United Kingdom was about 400, and of copies passing through the post offices of Great Britain and Ireland nearly 42,000,000.—A new stimulus was given to newspaper enterprise in 1836 by the reduction of the stamp duty from four

pence to a penny, causing in the first year of the full operation of the new act an increase of 8,000,000 in the stamps issued, and of 61 in the number of newspapers, which a year before the reduction was 397, and a year afterward 458. Fourteen of the new journals were established in London alone, including a short-lived ultra-liberal morning newspaper called "The Constitutional" (in place of the old "Public Ledger"), of which Laman Blanchard was the editor, Thornton Hunt the sub-editor, Douglas Jerrold the dramatic critic, and Thackeray the Paris correspondent. A socialist organ was published by Robert Owen, the "New Moral World," and a Chartist organ by Feargus O'Connor, the "Northern Star." The "Economist," celebrated for its collections of financial and commercial statistics and disquisitions, was established in 1834 by James Wilson (died in 1860), whose ability, first manifested in the conduct of this journal, raised him to the secretaryship of the treasury. The "Illustrated London News," the first of the great illustrated newspapers, was founded in 1842 by Herbert Ingram. The stamps on newspapers in the United Kingdom increased from 65,000,000 in 1843 to 71,000,000 in 1844. The railway mania produced in London many newspapers devoted to railway matters, their number amounting to about 30 in 1845, but only three of them survived the crisis of 1846. The "Daily News" was established in 1846, under the editorship of Charles Dickens; he was soon succeeded by Charles Wentworth Dilke, who established in connection with it the "Express" evening journal. The "Daily News" at one time enjoyed a circulation second only to that of the "Times." The ordinary daily circulation of the latter rose from 23,000 in 1846 to 29,000 in 1848, and to 36,000 in 1852. In 1854, during the Crimean war, its average daily circulation was 51,648, about double the aggregate of all the other daily morning journals, which was only 26,268. The number of newspaper stamps issued in 1854 in the United Kingdom was about 120,000,000. In 1855 the stamp duty was totally abolished as a tax, making it optional with the publishers to use the stamp as a means of paying postage on such copies of their impressions as were to be sent through the mails. The five-penny papers, except the "Times," which followed their example later, immediately reduced their price to 4d., the six-penny weekly papers to 5d., and the three-penny papers (which were established on the abolition of the four-penny tax in 1836) to 2d.; while a great number of penny weekly and daily papers sprang up. The prices of the leading metropolitan dailies have since been still further reduced, as will be seen by consulting the list given below; but of the many new daily papers established since 1855, only the "Daily Telegraph," the "Standard," and the "Pall Mall Gazette" have taken a permanent place among the leading London journals. The following is a list of the principal

daily newspapers now (1875) published in London, with their prices and some indication of their character :

MORNING PAPERS.

- Times**—established Jan. 1, 1788; 3*d.*; politics independent; free-trade.
DAILY TELEGRAPH—established June 2, 1855; 1*d.*; politics liberal. Remarkable for enterprise in collecting news, and for its correspondence.
STANDARD—established June 29, 1857; 1*d.*; organ of the conservative party.
DAILY NEWS—established Jan. 21, 1846; 1*d.*; politics liberal and independent. Its correspondence and critical articles have always held a high rank.
MORNING POST—established in 1772; 3*d.*; politics liberal-conservative; the chief fashionable journal, devoted largely to social topics.
MORNING ADVERTISER—established Feb. 8, 1794; 3*d.*; politics liberal and independent; largely devoted to the interests of merchants and tradesmen.
PUBLIC LEDGER—established in 1759; 2½*d.*; exclusively commercial.
FINANCIER—established in March, 1870; 2*d.*; financial and commercial.
DAILY RECORDER—established in November, 1869; 3*d.*; financial.

EVENING PAPERS.

- EVENING STANDARD**—established in 1827; 1*d.*; now forms an evening edition of the "Standard."
PALL MALL GAZETTE—established in 1865; 2*d.*; politics liberal; remarkable for literary ability, and in part a literary review.
ECHO—established in December, 1868; ½*d.*; independent; general newspaper.
GLOBE—established in 1803; 1*d.*; politics conservative.
SHIPPING AND MERCANTILE GAZETTE—established in January, 1836; 5*d.*; commercial.

There are also several local daily papers, like the "Daily Chronicle and Clerkenwell News" and others, devoted to London interests exclusively, or to particular localities. The "London Gazette," the organ of publication for official acts, appointments, &c., appears twice, and several other papers (in one or two cases summaries of news for the foreign mails) thrice a week. There are more than 150 weekly papers in London; they include "Punch" and such literary organs as the "Athenæum," "Saturday Review," "Spectator," "Academy," &c., and a very great number of papers devoted to special branches of science and art and occupations and classes of society. Among the weekly papers which reach the highest circulation are the "Illustrated London News" and the "Graphic," the latter an illustrated paper of very great artistic merit. Both devote much space to the illustration of current events.—French newspapers date their origin from the publication of the *Mercure françois* (1605-'45), a kind of historical compilation. Their more immediate prototype was the *Gazette* issued by Théophraste Renaudot in 1631, and continued under the name of *Gazette des Recueils* and *Gazette de France* till about 1789, appearing generally once, and for some time twice a week, and at length daily. A poetical newspaper, which chiefly treated of local gossip and scandal, was published by Loret for about 15 years during the second half of the 17th century. The *Mercure galant* (1672), a species of literary journal, was succeeded by the *Nouveau Mercure* and *Mercure de France*, which

was discontinued in 1815. The *Journal Étranger*, edited by the abbé Arnaud and Frémois, and having among its contributors Rousseau, Grimm, and Prévost, existed till 1763, when Arnaud became one of the editors of the *Gazette de France*. The *Moniteur*, the official organ of the government, was founded in 1789 and treated of moral and political subjects; while some of its contemporaries, especially the notorious *Nouvelles à la Main*, contained a budget of scandalous intelligence. From the close of the 17th century to the middle of the 18th, many weekly and monthly journals were published in Paris, chiefly literary and scientific, with which the most eminent men of France were connected. The first daily political newspaper was the *Journal de Paris, ou Poste du Soir* (1777–1825). The first political editor who attracted general attention was Linguet, who was connected from 1774 till 1783 with the *Journal de Politique et de Littérature*, better known under the title of *Journal de Bruxelles*, although it was issued in Paris. The famous *Courrier de l'Europe* was published in London (1776-'89) twice a week for 6*d.* a number; on its staff were Morande, Brissot, and the count de Montlosier. The revolution gave a powerful impulse to French journalism, and Mirabeau's *Courrier de Provence* (1789) became the precursor of thousands of newspapers of every description, the most violent of which was Marat's *Ami du Peuple*. After the 18th Brumaire all the political journals of Paris excepting 13 were suppressed by the first consul, and under the empire only five were permitted to appear, viz.: the *Moniteur*, *Gazette de France*, *Journal de Paris*, *Journal des Débats* (under the temporary name of *Journal de l'Empire*), and *Petites Affiches*. The condition of the press did not much improve after the restoration. The censorship was replaced in 1825 by securities to be furnished by each proprietor of a Parisian journal to the extent of 200,000 francs, and somewhat less in the provinces. The increase of the stamp duty from 5 to 10 centimes caused the price of the leading journals to be raised from 72 to 80 francs a year. The *Journal des Débats* was originally founded Aug. 29, 1789, by the printer Baudouin, Barrère, and Louvet, passed in 1800 into the hands of Louis François Bertin the elder, and has since remained the property of the Bertin family. It was conspicuous for the support of existing authorities, but after the restoration it advocated a moderate liberalism. Its literary and scientific departments have always held the highest rank; and, besides many others of nearly equal fame, it has counted among its regular contributors Royer-Collard, Malte-Brun, Geoffroy Saint-Hilaire, Saint-Marc Girardin, Jules Janin, Michel Chevalier, Philarrète Chasles, Prévost-Paradol, and Hippolyte Taine. The *Journal des Débats* has continued to hold its prominent place through all the political changes of recent years, and still advocates a policy of moderate liberalism. One

of the most prominent journals during the latter part of the restoration was the *Globe*, which counted among its contributors Guizot, Cousin, Jouffroy, and the duke de Broglie, and afterward Rémusat, Saint-Marc Girardin, and Carnot. Many of its writers were brought into political prominence by the revolution of 1830, after which the *Globe* appeared for a few years as an organ of St. Simonism. The *Constitutionnel*, established in the early period of the restoration, opposed the elder Bourbons, and reflected in a great measure the views of aspiring and influential politicians of the higher middle class and of the military and civil aristocracy created by Napoleon. Thiers and Mignet wrote largely for this journal until toward the end of the restoration, when they found a more energetic outlet for their liberal opinions in the *National*; and shortly after the July revolution the *Constitutionnel* lost its political influence. The *National*, founded at the beginning of 1830, rapidly gained importance through the influence of Louis Philippe, Talleyrand, Laffitte, and other opponents of the elder branch of the Bourbons; and its first editorial staff comprised Thiers, Mignet, and Carrel. It contributed powerfully to the overthrow of the government of Charles X., soon after which it became, under the sole editorship of Carrel, equally opposed to that of his successor. Carrel was succeeded by Bastide, and the latter by Armand Marrast; and the *National* took as prominent a part in the overthrow of Louis Philippe as it had in that of Charles X. The foundation in 1836 of the *Presse*, by Émile de Girardin, at 40 francs a year, half the price of the leading journals, called the cheap press into existence. A powerful means of the success of the *Presse* and of the *Siècle*, which also reduced its price to 40 francs, was the publication of novels in their *feuilletons*, for which the services of Eugène Sue, Alexandre Dumas, and other celebrated writers were enlisted at extravagant prices. The fortunes of the *Constitutionnel* were also revived under the editorship of Dr. Véron, by the reduction of its price, and by the publication in its *feuilletons* of *Le Juif errant*, for which he paid Eugène Sue 100,000 francs. Sainte-Beuve was for a long time its literary critic. Under the direction of Véron, the *Constitutionnel* increased its circulation to upward of 20,000; and the general influence of the cheap press, and its handmaid the *feuilleton*, increased the aggregate of subscribers from 70,000 in 1835, when the number of the principal daily journals in Paris was 20, to 180,000 in 1845, when there were 26. The *Siècle* became the favorite paper of the lower middle classes, and reached in 1846 a circulation of upward of 40,000. Within three months after the revolution of 1848, about 400 new journals sprang into existence, many of which were ultra socialistic or democratic. The principal organ of the moderate republicans was still the *National*, and of the more radical party

the *Réforme*, founded by Godefroy Cavaignac and edited by Flocon. After June, 1848, the newspapers were again required to deposit security and pay stamp duty, and many were consequently obliged to stop. The estimated daily circulation of newspapers in Paris in 1850 was: of republican organs, 129,000; Orleanist and legitimist, 83,000; Bonapartist, 65,000; total, 277,000. The *coup d'état* of Dec. 2, 1851, terminated the existence of the *National*, as well as of many other liberal organs. The restrictions imposed under the second empire were extremely unfavorable to the growth of the French political press, and comparatively few new papers attained other than literary importance during the earlier years of Napoleon's rule. In 1853, instead of the former multitude of Parisian daily journals, there were but 14 having the slightest importance; of these the following are noteworthy: the *Journal des Débats*, *Presse*, *Siècle*, *Constitutionnel*, *Pays*, *Patrie*, *Univers*, *Assemblée nationale*, *Gazette de France*, *Union*, and *Charivari*. The *Moniteur* was the official journal till 1869, when it was replaced by the *Journal officiel*. Of later origin than those just named were the *Temps*, *France*, *Avenir national*, *Opinion nationale*, *Liberté*, *Courrier français*, *Époque*, *National*, *Paris-Journal*, the long prominent *Gaulois*, and the very successful *Figaro*. All of these met with some success and influence, though only the last has attained any remarkable permanent position. Nearly all were subjected to frequent prosecutions, and several were suppressed. It was only in the later years of the empire that the political press again became a formidable power in France. Rochefort's *Lanterne* (1868), a weekly publication entirely devoted to attacks upon the emperor and his party, marks an epoch in the history of French journalism, and attained a most extraordinary success and influence. The *Rappel*, *Cloche*, *Marseillaise*, *Journal de Paris*, and many other political sheets sprang up and became involved in endless difficulties with the government; but their influence was great and their circulation in some cases phenomenal. The revolution of Sept. 4, 1870, had much the same influence upon the French press as that exercised by the proclamation of the republic in 1848; calling into existence a multitude of new papers, many of which attained considerable temporary success in spite of the Prussian siege and the disturbed state of the capital. Such were the *Vérité*, *Constitution*, *Mot d'Ordre*, *Patrie en Danger*, *Bien public*, and *Soir*. The communal insurrection, largely excited by and under the partial guidance of journalists of the revolutionary order, gave rise to an immense number of popular journals, most of them of the most violent character; but only one or two survived the downfall of the commune. Prominent among them were the *Ori du Peuple*, *Paris libre*, *Sociale*, *Bonnet Rouge*, *Commune*, *Affranchi*, *Réveil du*

Peuple, Père Duchêne, and Montagne. Among the more prominent journals which have appeared since the suppression of the commune and the return of political affairs to the ordinary channel, are the *République française*, the *Radical* (which was suppressed after a brief existence), and the *XIX^{me} Siècle*. In all, Paris has 791 periodicals, of which 113 are political, 90 scientific, 78 religious, 58 devoted to fashion, 42 legal, 39 financial, 14 military, 9 naval, and 8 architectural.—Italian newspapers are traced to the early *gazzette* of Venice of the 16th century, many volumes of which in manuscript are preserved in the Magliabecchian library, while one printed copy dated 1570 is in the British museum. In more modern times the principal newspapers consisted at first only of those serving as official organs of the respective authorities, as the *Diario di Roma* and *Gazzetta di Napoli*. The *Voce della Verità*, published in Modena (1831), was ultra conservative; and the *Antologia*, established ten years earlier in Florence, was ultra liberal. The total number of Italian newspapers in 1836 was 171; in 1845, 205. After the accession of Pope Pius IX. in 1846, Italy produced an enormous crop of new journals, chiefly revolutionary, which were discontinued in 1849; and with the exception of Sardinia, the Italian press was again put under restraint until 1859-'60. The changes of those years conferred an almost complete freedom upon the whole Italian press, and called into existence a great number of new political journals. In 1859 the Turin *Opinione*, which is still an important Italian journal, reduced its price to one sou. With the *Diritto*, another important paper, the *Opinione* was removed to Florence in 1865, on the removal of the capital to that city. Between that year and 1870 Florence remained the central point of Italian journalism, and all parties were represented there by political newspapers; but on the second transfer of the seat of government to Rome nearly all of these again removed thither, and are now published in the new political centre. The chief of them, besides the *Opinione* already referred to, are the official organ, the *Gazzetta ufficiale del Regno d'Italia*, and *L'Italie*, published in French and looked upon as the organ of the department of foreign affairs.—The first regular newspaper in Spain was the court journal, *Diario de Madrid*, established about the middle of the 18th century. After the establishment of the liberty of the press in 1834, nearly 20 political journals were started in Madrid alone, and more than 40 were published there in 1844, the *Heraldo* (*moderado* organ) circulating 7,000 daily. Satirical and humorous papers have played an important part in the history of Spanish journalism, and many of the ablest writers are engaged in the conduct of literary, scientific, artistic, and religious papers. About 30 journals were published at the beginning of 1861 in Madrid, the most important of which were the *Clamor publico* and *España*; and in

1863 the total number in Spain was 279, of which 93 were devoted to special scientific or literary branches. After the political reaction of 1866 all the more influential liberal papers were suspended. Many of them were renewed in 1868, but without force or vigor, and suffering constant official persecution. At this time the *Diario español*, *Política*, and other journals, represented the liberal party; the absolutist organs were the *Esperanza*, *Pensamiento español*, *Lealtad*, and several other papers; the *Español* and *España* were ministerial organs. Portuguese newspapers are confined to the organ of government, the *Diário do Governo*, and some half dozen other journals published in Lisbon, and to a corresponding number in Oporto and other cities.—German newspapers were preceded by irregular publications of news, a specimen of the oldest of which, dated in 1494, is preserved in the university library of Leipsic. Summaries of events, generally in Latin, and with such titles as *Relationes Semestrales*, *Relationum Historicarum Pentapulus*, &c., were frequently published at stated intervals in Germany during the 16th century. The first regular journal was a weekly paper established in 1615 by Egenolph Emmel, a bookseller at Frankfort, and published at his own expense. In imitation of this the *Frankfurter Oberpostamts-Zeitung*, the oldest successful German paper, was founded in 1616 by the postmaster, Johann von der Birghden. Beginning as a weekly, it was many years later made a daily paper, and as such existed till 1866. This was followed by newspapers in all the leading cities of Germany, and by the middle of the 17th century they had become subject in most cases to government censorship, and generally contained little besides official publications. One considerable journal, *Der Hamburgische Correspondent*, was founded in 1714; but with this exception the history of the German press is unimportant until the period of the French revolution, when many political papers sprang up in Germany as elsewhere. The *Vossische Zeitung*, still an important journal of Berlin, and the *Spener'sche Zeitung*, which held a prominent place until the year 1874, when it stopped publication, had been founded before that period, but were almost exclusively literary until the events of 1789-'93. In 1798 appeared at Tübingen the *Allgemeine Zeitung* (now of Augsburg), destined to surpass in success and permanence all other German journals. It was founded by Cotta the publisher, and was at first called *Neueste Weltkunde*, but almost immediately changed to its permanent title. It suffered from repeated government persecutions on account of its outspoken character; and in 1799 it was transferred from Tübingen to Stuttgart, in 1803 to Ulm, and in 1824 to Augsburg, the present place of publication. Its conductors have been successively Posselt, Huber, Stegmann, Kolb and Mebold, Kolb and Altenhöfer, and since Kolb's death in 1865 Altenhöfer alone. After the beginning of the

present century the growth of the German press was very rapid, though for a time the French rule prevented the existence of any really national school of journalism, and political papers of consequence only appeared after 1813. Kotzebue's *Russisch-deutsches Volksblatt* (Berlin), Niebuhr's *Der Preussische Correspondent*, Brockhaus's *Deutsche Blätter*, Görres's *Der Rheinische Mercur*, and *Der Deutsche Beobachter* of Hamburg were among the most influential journals of this period, though most of them were short-lived. Vienna had at this time the Austrian official organ, the *Wiener Zeitung*, and *Der Oesterreichische Beobachter*, which was regarded as semi-official. In Berlin, the *Preussische Staatszeitung* was founded about 1816. In 1819 a decree of the Bundestag placed the press throughout Germany under an exceedingly strict censorship, and thus its rapid increase was again suddenly checked. The French revolution of 1830 gave a fresh impetus to its progress, and called into existence several radical journals, as Siebenpfeiffer's *Westbote*, Wirth's *Deutsche Tribune*, and *Der Freisinnige* by Rotteck and Welcker; but most of them were suppressed in 1833. Among the ablest journals published between that period and the revolution of 1848 was the *Rheinische Zeitung*, established in Cologne in 1841, where it continued until 1850. The increase from 1840 to 1848 was steady and moderately rapid. Several noteworthy journals attained success during this period, the more important being the *Leipziger Allgemeine Zeitung* (begun in October, 1837), which in 1843 changed its name to that of *Deutsche Allgemeine Zeitung*, and the *Kölnische Zeitung*. The *Bremer Zeitung* and *Weserzeitung* also gained their first importance at this time. The revolution of 1848 caused the birth of a great multitude of journals, most of them of the violent political order, and very short-lived. In 1849 the total number of German newspapers, excluding purely scientific and literary journals, was 1,551. This includes the German papers of Austria, Switzerland, and the Baltic provinces of Russia. From that date the number steadily increased; in 1855 it was estimated at 1,600, besides 860 scientific and literary journals; and in 1868 the number of journals of all kinds was 2,566, of which 761 were entirely political. The wars of 1866 and 1870-'71, the unification and rapid advance in power of the German empire, and other causes have contributed to foster the growth of the German press. Its gain in influence in Europe has been accompanied by a corresponding increase in ability, and it is now more prominent than ever as a political power. In March, 1872, the most trustworthy statistics obtainable gave the number of German journals as follows (excluding all purely literary and scientific publications not properly included under the name of newspaper): in Prussia, 951; Bavaria, 250; Saxony, 119; Würtemberg, 102; Baden, 72; Hesse, 53; Mecklenburg-Schwerin, 51; other states of the empire,

145; total, 1,743. The principal dailies in Berlin (1875) are the *Vossische Zeitung*, *Volkszeitung*, *Staatsbürgerzeitung*, *Nationalzeitung*, *Neue Preussische Zeitung* (commonly known as the *Kreuzzeitung*), *Norddeutsche Allgemeine Zeitung* (semi-official), *Post*, and *Zukunft* (democratic). The *Börsenzeitung* and *Bank- und Handelszeitung* are the principal financial journals. The *Staatsanzeiger* and (since 1871) the *Reichsanzeiger* are official, corresponding to the London "Gazette." The *Intelligenzblatt* is an important local sheet, and is the favorite for advertisements. *Kladderadatsch* is a humorous weekly corresponding to the London "Punch," and there are great numbers of other weekly papers. In all, Berlin in 1871 published 175 newspapers, including weeklies and similar periodicals. Leading journals of the empire outside of Berlin are the very influential *Augsburger Allgemeine Zeitung*, already mentioned, the *Kölnische Zeitung*, the *Hamburger Correspondent*, the *Deutsche Allgemeine Zeitung* of Leipsic, and the *Stettiner Zeitung*. The Austrian press is much inferior to that of the German empire, and has had its growth almost entirely in Vienna. In 1846 there were in the whole territory of Austria but 155 periodicals of all classes, and among them only 41 political journals, most of which were practically made up from the *Wiener Zeitung*, the official government organ. The revolution of 1848 called forth in Austria as elsewhere a multitude of political newspapers; but they were unimportant and short-lived. Only within the last decade has Austrian journalism attained a greater influence; and this is now almost entirely centred in the Vienna press. The chief journals of that city, besides the official *Wiener Zeitung*, are the *Neue freie Presse* (which in ability and influence rivals the foremost journals of the German empire), the *Presse*, and the *Abendpost*; and there are several cheaper journals of wide circulation, such as the *Morgenpost*, *Fremdenblatt*, and *Vorstadtzeitung*. Outside of Vienna are the *Bohemia* at Prague, the *Mährischer Correspondent* at Brünn, and the *Triester Zeitung* at Trieste.—The first regular series of Hungarian newspapers was published in Latin in 1721, and the first in the vernacular tongue appeared in 1781 in Presburg. The principal Hungarian journals shortly before the revolution of 1848-'9 were the *Jelenkor* ("Present Age"), the organ of Count Széchenyi, *Világ* ("Light"), *Budapesti híradó* ("Buda-Pesth Intelligencer," edited by Count Emil Dessewffy), *Pesti hírlap* ("Pesth Journal," edited by Kossuth), and the *Pesther Zeitung*, in German. Among the most celebrated journals which sprang up during the revolution were the *Közlöny* ("Organ"), the revolutionary *Moniteur*, and *Kossuth hírlapja* ("Kossuth's Journal"), edited by Bajza. Among the principal newspapers which have appeared in Hungary since the revolution are the *Budapesti napló* ("Buda-Pesth Diary"), edited by

Baron Kemény, the *Hon* ("Fatherland"), edited by Jókai, and the *Pesther Lloyd*, in German. In 1868 the total number of journals and similar periodical publications was 205, 53 being political; 111 were printed in Hungarian, 29 in Slavic languages, 55 in German, 6 in Roumanian, and 4 in Italian.—The first Turkish newspaper appeared in French in 1795, but the actual founder of journalism in Turkey was Alexandre Blacque (father of Blacque Bey, late Turkish minister to the United States), who established at Smyrna in 1825 the *Spectateur d'Orient*, which, under its subsequent title of *Courrier de Smyrne*, exerted considerable influence during the Greek revolution. The official journal has appeared in French since 1831 under the title of *Moniteur Ottoman*, and in Turkish since 1832 under that of *Ta'quimi Vaqâi*. The leading Constantinople journals are now the *Journal de Constantinople* in French, the *Dyeridei Havadis* in Turkish, and the "Levant Herald" and "Levant Times" in English; besides which several other papers in French, Italian, modern Greek, and Armenian are published in various parts of the Ottoman empire. A modern Syrian newspaper has been published by missionary enterprise since 1850 at Oroomiah. Armenian journals have existed at various periods in Vienna, Venice, Transcaucasia, Calcutta, Madras, and Singapore, some of which are still in existence.—The origin of Greek newspapers dates from the national independence. The centre of Greek journalism is Athens. The number of periodicals published in Greece is more than 80, of which about 75 are in the Greek language. The leading political journal of Athens is the *Spectateur d'Orient*, a semi-monthly journal published there in French since 1852. There are journals published at Syra, and in the Ionian islands; there are several publications in English and Italian as well as in Greek.—Newspapers were established in the Low Countries before they were known in Great Britain, France, or Germany. The earliest appears to have been the *Nieuwe Tydinghen*, published at Antwerp by Abraham Verhoeven in 1605. No copy of this journal anterior to 1619 is now known to exist, and it is somewhat uncertain whether it was from the beginning a regular periodical. It was followed by the *Port-Tydinghen*, which was published between 1637 and 1644, and was the foundation of the *Gazette van Antwerpen*, which continued till 1827. At Brussels at least two newspapers were in existence between 1637 and 1645. The *Annales politiques* of that city was a famous journal of the last century, and the Austrian government subscribed for 1,200 copies of it annually. It was so popular that a pirated edition was regularly printed and circulated. The most noted Belgian journals at the present day are the *Moniteur belge*, the official paper, the *Indépendance belge*, an organ of the liberal party, and *Le Nord*, a Russian organ, published in Brussels, and conducted with much abil-

ity. Independent newspapers are the *Écho de Bruxelles* and the *Journal de Belgique*, both published at Brussels. Holland has numerous newspapers, but none of much political importance. The principal ones are the *Handelsblad* of Amsterdam, the *Courant* of Haarlem, and the *Staats Courant* and the *Journal de la Haye*, both published at the Hague.—In proportion to its population, Switzerland has a more productive periodical literature than almost any other European nation; and the Swiss political and general press is especially flourishing. In 1868 there were 375 journals of all classes, of which 246 were printed in German, 116 in French, and 13 in Italian. Most of these papers are circulated in small neighborhoods, discuss local affairs, and have little political influence; but a few, such as *Der Bund* in Bern, the *Neue Züricher Zeitung*, the *Journal de Genève*, and the *Gazette de Lausanne*, are more widely known and read.—Peter the Great took a personal part in the establishment of the first Russian journal, published at Moscow in 1703. Journals appearing once or twice a week are published in almost every chief city of the Russian governments; but the principal seats of Russian journalism are St. Petersburg and Moscow. There is no journal in Russia which corresponds exactly to the French *Moniteur*. The "Gazette of the Senate" is official in regard to the publication of laws, ukases, and other regulations of a strictly administrative character. Other official organs are the *Journal de St. Pétersbourg*, published in French, for information in regard to the imperial court and to foreign affairs, and the "Northern Post," concerning the interior administration. During the reign of Nicholas the "Northern Bee" had considerable influence. The *Invalide russe* is a semi-official organ in military affairs. The "Police Gazette" of St. Petersburg relates chiefly to police regulations. Among the other daily journals are the "Son of the Fatherland," the "St. Petersburg Gazette," and the "Commercial Gazette," which last is published both in Russian and German; and the most prominent of them all is the *Golos* ("The Voice"). The most popular humorous journal is *Iskra* ("The Spark"). The principal daily journals of Moscow are the "Russian Messenger," the "Police Gazette," and the "Moscow Gazette," the oldest and most influential political journal of the empire, edited by Katkoff. In the Baltic provinces daily journals are published in German, particularly in Riga. The journals of Finland are published in Swedish, and those of Poland and Lithuania in Polish. Owing to the restrictions on the press, however, the Polish journals of Warsaw and Wilna are insignificant compared with those published in Galicia, such as the *Cracow Czas* ("Times") and the *Lemberg Gazeta Narodowa* ("National Gazette"), or in Posen. In Kazan a journal is published in Tartar, in Astrakhan one in Kalmuck. Odessa has daily

journals in French and Italian.—The earliest newspaper in Sweden was the *Ordinarie Post-Tidning*, established in 1643; but the journals had little political influence till 1820, when the *Argus* appeared at Stockholm. Since then the *Fäderneslandet* and the *Aftonbladet* have been the principal journals of the capital, the former conservative, the latter liberal. There is a newspaper published in every considerable town of the kingdom; the total number of periodicals published in 1867 was 179. The *Christiania Intelligentsedler*, founded in 1763, is the oldest newspaper in Norway. The *Constitutionnelle* at Bergen is the organ of the government; and the *Morgenblad*, established at the same place in 1819, is the journal of the popular party. The oldest newspaper of Denmark is the *Berlingske Tidende*, which was first published in 1749 in German, but now appears in Danish. Until 1830 Copenhagen had but two journals, and those of little influence. In 1849 the number of political papers in the kingdom was 36. The total number of periodicals is now upward of 200.—In China, a species of newspaper has existed at Peking for centuries under the title of *King Chau*, "Court Transcripts," which is commonly called by Europeans the "Peking Gazette." It is compiled from the papers presented before the general council of the empire, and constitutes the principal medium available to the people for ascertaining what is going on in the country. Couriers are despatched to all parts of China bearing copies of these papers to the high provincial officers. Anybody is permitted to print these documents without note or change, and to sell them to the people. In the provinces thousands of persons find employment in copying and abridging them. In 1827 an English weekly newspaper, the "Canton Register," was established at Canton; and in 1836 a similar journal, the "Canton Press," made its appearance. At present the "North China Mail" and "Shanghai Herald" at Shanghai, and the "China Mail" at Hong Kong, are the principal English newspapers in that quarter. In the island of Penang the "Prince of Wales Island Gazette" was founded in 1805, suspended for some years, and revived in 1833. At Singapore, the "Singapore Chronicle" was established in 1823; at the same place the "Straits Times" is now published.—In India, "Hicking's Gazette" was established at Calcutta, in January, 1871; and in 1795 the Bengal *Hurkuru* made its appearance and still continues, the oldest of the Indian newspapers. It became a daily in April, 1819. Until 1835 the press in India was restrained either by a censorship or by the right assumed by the East India company of deporting to Europe obnoxious editors. (See BUCKINGHAM, JAMES SILK, and DUANE, WILLIAM.) A law in 1835 removed all arbitrary restrictions upon the press. On the outbreak of the sepoy mutiny in 1857, an act was passed prohibiting the use of the press except under a

license; this act, however, was by its term limited to one year from date. The leading English journals now in existence in Hindostan are the "Friend of India" at Serampore, the "Gazette" and "Englishman" at Calcutta, the "Athenæum" and "Spectator" at Madras, the "Herald" at Bangalore, the "Times," "Telegraph," and "Gazette" at Bombay, the "Gazette" at Delhi, the "Observer" at Poonah, and the "Chronicle" at Lahore. At Calcutta and at some other cities there are newspapers in the native languages.—The first newspaper in Australia was the "Sydney Gazette and New South Wales Advertiser," founded in 1803 by George Howe. At present a great number exist in the various colonies, of which the principal dailies are: at Melbourne, the "Argus," the "Age," and the "Herald;" at Sydney, the "Herald" and the "Empire." In New Zealand the "Southern Cross," "New Zealand Gazette," and a number of other papers are published. Several are published in Tasmania, at Hobart Town and Launceston, and also several in Cape Colony, the first of which was the "South African Commercial Advertiser," established in 1824.—In the Hawaiian islands several newspapers are published in Hawaiian and English. The chief of the latter are the "Honolulu Gazette" and "Pacific Advertiser." In Japan there are several papers in English, the "Japan Herald" of Yokohama being the best known; in the native language there is an official government gazette, and within a few years several political journals, modelled upon those of Europe, have been begun at Tokio (Yedo).—Among the countries of South America, Brazil, with a total of about 60 dailies and a very large number of weeklies and periodicals, has the most important press. The leading papers are of course published at Rio de Janeiro; the number of periodical publications of all kinds in that city is 58. The leading dailies are the *Diario official* and the *Jornal do Rio*. There are also four English and four French newspapers, and one German. An influential daily, the *Diario de Bahia*, is published at Bahia. The press of the Argentine Republic, having its chief activity in Buenos Ayres, ranks next to that of Brazil. "The Standard," published in English, is the leading daily; others are the *Tribuna*, the *Nacional*, and the usual *Diario official*. There are also papers in French, German, and Italian. Venezuela has several important dailies, chief among them the *Federalista* and the *Opinion nacional*, published at Carácas. Peru has a very influential press, the *Comercio* and *Heraldo* of Lima having a wide circulation outside the country as well as in it. In all, Peru has nearly 40 journals. In Chili the *Ferrocarril*, *Independiente*, and *Mercurio* are the most important among the eight dailies of Santiago. Valparaíso has four dailies, of which the *Mercurio*, *Patria*, and "West Coast Mail" are important. The press of the United States of Colombia is unimportant; the papers

are numerous, but very ephemeral. The longest-lived and best known is the *Tradiccionista* of Bogotá. The "Panama Star and Herald," which can hardly be classed as a Colombian paper, has considerable commercial importance. In Mexico the oldest and most important daily is the *Siglo XIX.*; there are also the *Universal*, *Revista Universal*, *Idea Progresista*, and *Iberia*, all published in the city of Mexico. At Vera Cruz the *Pensamiento* is an important paper. In Cuba the chief journals are the following, at Havana: *Diario de la Marina*, *España*, *Progreso*, and *Voz de Cuba*. Three dailies are published at Cienfuegos, two at Santiago, two at Matanzas, and two at Sagua la Grande.—The first American newspaper was issued at Boston, Sept. 25, 1690. It was printed by Richard Pierce and published by Benjamin Harris, and was intended to be issued once a month, but was immediately suppressed by the authorities. The only copy known to be in existence is in the state paper office in London, and it is headed "Publick Occurrences, both Foreign and Domestick." The "Boston News Letter," published by John Campbell, appeared April 24, 1704, and continued to be issued weekly till 1776. It was followed by the "Boston Gazette," Dec. 21, 1719; and the "American Weekly Mercury" was issued by Andrew Bradford at Philadelphia, Dec. 22, 1719. On Aug. 17, 1721, James Franklin, elder brother of Benjamin Franklin, established at Boston the "New England Courant" (weekly), which soon became involved in a violent controversy with the Rev. Increase Mather and other ministers on the subject of inoculation, and was so free in its remarks on public affairs, that in 1722 the legislature issued an order forbidding James Franklin "to print or publish the 'New England Courant' or any other pamphlet or paper of the like nature, except it be first supervised by the secretary of this province." James Franklin's name was consequently taken from the paper, and that of Benjamin, then but 16 years of age, and an apprentice in the office, was substituted. In the "Courant" he began his literary career, and at this period he was one of the most frequent and pungent of its writers. On Oct. 16, 1725, William Bradford, father of Andrew Bradford of Philadelphia, began the publication of the "New York Gazette," the first newspaper issued in that city. In 1728 Benjamin Franklin established in Philadelphia the "Pennsylvania Gazette," which continued under different publishers till Nov. 3, 1845, when it was merged in the "North American." In 1754 four newspapers were published in Boston, two in New York, two in Philadelphia, and the "Virginia Gazette" at Williamsburg, which was first issued in 1736 by William Parks, who had previously published for nine years the "Maryland Gazette" at Annapolis. In 1776 seven were published in Massachusetts, one in New Hampshire, two in Rhode Island, four in Connecti-

cut, four in New York, nine in Pennsylvania, two each in Maryland, Virginia, and North Carolina, three in South Carolina, and one in Georgia—in all, 37. These were all weeklies, with the exception of the "Advertiser" of Philadelphia, which was semi-weekly. During the revolution the principal journal in Boston was the "Gazette," established in April, 1755. In this journal John Adams, under the signature of Novanglus, wrote in 1775 a series of papers in defence of the colonial cause. The "Massachusetts Spy," edited by Isaiah Thomas, the historian of American printing, was established in Boston March 7, 1771, and removed to Worcester in 1775, where it is still published under the title of the "Worcester Spy." In New York, during the revolution, Rivington's "Royal Gazette," established in 1773, was a zealous supporter of the royal cause, and was discontinued soon after the peace of 1783. In 1797 was established the "Commercial Advertiser," now the oldest of New York newspapers. In 1800 the number of newspapers in the United States had increased to 200, of which several were dailies, the first daily having been the "Pennsylvania Packet, or the General Advertiser," called afterward the "Daily Advertiser," which continued to be issued daily from 1784 to 1837. In 1801 the "Evening Post" was founded by William Coleman, and William C. Bryant, William Leggett, and Parke Godwin have been its editors. The "National Intelligencer" was founded at Washington by Samuel Harrison Smith, and was first issued as a tri-weekly on Oct. 31, 1800. Joseph Gales became connected with it in 1807, and continued its editor till his death in 1860. In 1812 he took into partnership his brother-in-law, William W. Seaton, by whom the journal was edited till January, 1865. It was issued as a daily from January, 1813, to 1869, when it was discontinued. From 1800 to 1810 the number and circulation of American newspapers largely increased. By the census of 1810 the number of journals was 359, of which 27 were dailies, and the total annual issue was 22,321,000 copies. In 1824 there were 11 daily newspapers in Philadelphia and 12 in New York, with a circulation varying from 1,000 to 4,000 copies. In 1828 the whole number had increased to 852, with a yearly issue of 68,117,796 copies. In 1830 the number was estimated at 1,000. The census of 1840 returned 1,631 newspapers, with a yearly issue of 195,838,673 copies; in 1850 the number had reached 2,526 newspapers, with 5,142,177 circulation, and a yearly issue of 426,409,978 copies; in 1860, 4,501 newspapers, 13,663,409 circulation, yearly issue 927,951,548 copies; and in 1870, 5,871 newspapers, 20,842,475 circulation, yearly issue 1,508,548,250 copies. Rowell's "American Newspaper Directory" (New York) gives the following table showing the number of newspapers published in the United States and territories and British America in 1874:

STATES.	Daily.	Weekly.	STATES.	Daily.	Weekly.
Alabama.....	10	78	Oregon.....	4	33
Arkansas.....	4	55	Pennsylvania....	74	485

About one seventh of the daily papers print tri-weekly or semi-weekly editions; nearly every daily issues a weekly; a few journals issue only semi- or tri-weekly editions; the weekly total includes religious, literary, agricultural and horticultural, technical and professional, illustrated, and miscellaneous papers.—In 1833 a “penny paper” called “The Sun” was established in New York by Benjamin H. Day, but it soon passed into the hands of Moses Y. Beach. It was at first about 10 inches square, and being sold for one cent, grew rapidly into a circulation of 60,000 copies. It was afterward enlarged, and its management and character having been changed in 1867, its circulation was greatly increased, the price being two cents. In 1835 James Gordon Bennett began the publication of the “New York Herald,” at first as a penny paper, but afterward raised the price to two cents, and subsequently to four cents. At his death it passed into the hands of his son, James Gordon Bennett, jr., by whom it is now conducted. On April 10, 1841, the “Tribune” was founded by Horace Greeley, and it was edited by him till his nomination for the presidency in 1872, when he was succeeded by White-law Reid. Politically it is now independent. The “New York Times” was established in 1850 by Henry J. Raymond. “The World” was established in June, 1860, as a religious daily, and in July, 1861, united with itself the “Courier and Enquirer.” In 1862 it was purchased by Manton Marble, who made it a democratic journal, and who still edits it. “The Graphic,” established in 1873, was the first attempt in this country to publish an illustrated daily paper. The “Herald,” “World,” and “Times” are published every day in the year, and their Sunday issues are sold at five cents. In 1849 the New York “Journal of

Commerce,” “Courier and Enquirer,” “Tribune,” “Herald,” “Sun,” and “Express” combined to form the “New York Associated Press,” of which the “Times” on its establishment in 1850 became a member; the “World” when founded in 1860 was made a participant in its news privileges, and in 1861 by absorbing the “Courier and Enquirer” became a member. The association collects and distributes to the newspapers the latest news by telegraph from all quarters, at an annual expense (in 1875) of about \$1,000,000. The New York “Evening Post,” “Commercial Advertiser,” and *Staats-Zeitung* buy their telegraphic news from the associated press, as also do the local associations known as the “New York State Associated Press,” the “Western Associated Press,” the “New England Associated Press,” and the “California Associated Press.” The “American Press Association,” organized in Boston in July, 1870, is independent. Some of the New York weekly papers, as “Harper’s Weekly,” “Frank Leslie’s Illustrated Newspaper,” and the “New York Ledger,” have an immense circulation, that of the last having at times exceeded 400,000 a week. A noteworthy one is the chief American sporting paper, “The Spirit of the Times,” founded by William T. Porter, Dec. 10, 1831, conducted by him for 25 years, and merged in the present journal of the same name, originally “Wilkes’ Spirit of the Times,” under the management (still continued) of George Wilkes. The religious newspapers, of which the earliest was the “Boston Recorder,” established in 1815, are weekly. The chief of these published in New York are the “Observer” and “Evangelist,” Presbyterian; “Independent,” Congregational; “Churchman,” Episcopal; “Christian Advocate,” Methodist; “Examiner,” Baptist; “Liberal Christian,” Unitarian; “Christian Intelligencer,” Reformed; “Christian Union,” Congregational; “Morning Star,” Freewill Baptist (chief office at Dover, N. H.); “Tablet,” Roman Catholic; “New Jerusalem Messenger,” Swedenborgian; and the “Jewish Messenger.” Many country publishers now purchase “auxiliary papers,” having one side filled with general matter, and print the other side for their respective localities. Newspapers in foreign languages were published in the United States in 1874 as follows: German, 310—58 in Pennsylvania, 50 in New York, 33 in Ohio, 25 in Wisconsin, 24 in Illinois, 16 in New Jersey, 15 in Indiana, 14 in Missouri, 11 in Iowa, 9 in California, 7 in Texas, 6 each in Kentucky, Michigan, and Minnesota, 4 each in Maryland, Kansas, and Nebraska, 2 each in Massachusetts, Connecticut, Virginia, Louisiana, and Colorado, and 1 each in Delaware, the District of Columbia, West Virginia, South Carolina, Georgia, Tennessee, Dakota, and Oregon; French, 28—18 in Louisiana, 5 in New York, 2 in Massachusetts, and 1 each in Rhode Island, Illinois, and California; Scandinavian, 19—8 in Illinois, 3 in Minnesota, 2 in New York, and 1 each in Iowa,

Wisconsin, Kansas, Nebraska, Utah, and California; Spanish, 16—7 in New York, 6 in New Mexico, and 3 in California; Dutch, 6—5 in Michigan and 1 in Iowa; Italian, 2—1 each in New York and California; Welsh, 4—3 in Pennsylvania and 1 in New York; Bohemian, 5—2 in Nebraska, and 1 each in Ohio, Iowa, and Wisconsin; Polish, 2—1 each in Illinois and Missouri. There is a Portuguese paper in New York, a Chinese in San Francisco, and a Cherokee at Tahlequah, Indian territory. (See PERIODICAL LITERATURE.)

NEWSTEAD ABBEY, the family seat of Lord Byron, situated on the verge of Sherwood forest, England, $8\frac{1}{2}$ m. W. of Nottingham. The building was originally a priory of black canons, founded in 1170 by Henry II., and at the dissolution of the monasteries was granted by Henry VIII. to Sir John Byron. It was then a fine specimen of the early Anglo-Gothic, unsurpassed in elegance of composition and deli-

Newstead Abbey.

cacy of execution, and "stood embosomed in a happy valley," the slopes of which were covered by the broad oaks of Sherwood forest. The new possessor converted a portion of the building into a dwelling; and his successors have altered, embellished, or added to it, until it presents a singular mingling of opposite styles of architecture. The fifth Lord Byron, great-uncle of the poet, pulled down a large part of the house, cut down extensive plantations, and did all he could to injure the estate, from some cause of irritation against his son and heir, who however died before him. In 1817 Byron parted with Newstead for £180,000 to Col. Thomas Wildman, an old schoolfellow, who carefully preserved whatever relics of the poet he found there, and spent more than £200,000 on the reparation of the property, which on his demise in 1859 was put up at auction, the reserved price being £180,000. As the highest bid was but £121,000, the

estate was bought in by Col. Wildman's representatives, and subsequently it came into the possession of William Frederick Webb, who now (1875) owns and occupies it.

NEW TESTAMENT. See BIBLE.

NEWTON, the name of counties in six of the United States. **I.** A central county of Georgia, bounded S. W. by South river, and intersected by Yellow and Ucofauhatchee rivers, all three uniting at its S. extremity to form the Ocmulgee; area, about 400 sq. m.; pop. in 1870, 14,615, of whom 6,014 were colored. It has an undulating surface and a soil very fertile near the streams. It is intersected by the Georgia railroad. The chief productions in 1870 were 38,414 bushels of wheat, 192,587 of Indian corn, 31,974 of oats, 23,455 of sweet potatoes, 5,770 bales of cotton, 5,871 lbs. of wool, 67,455 of butter, 9,887 of honey, and 1,512 gallons of molasses. There were 968

horses, 1,112 mules and asses, 1,936 milch cows, 489 working oxen, 2,293 other cattle, 3,602 sheep, and 7,704 swine; 2 manufactories of cotton yarn, 9 tanneries, and 4 saw mills. Capital, Covington. **II.** A central county of Mississippi, drained by the head branches of the Chickasawha river; area, about 625 sq. m.; pop. in 1870, 10,067, of whom 3,386 were colored. It is intersected by the Vicksburg and Meridian railroad. The chief productions in 1870 were 2,492 bushels of wheat, 201,704

of Indian corn, 7,205 of oats, 30,262 of sweet potatoes, 3,399 bales of cotton, 5,650 lbs. of wool, 42,030 of butter, and 1,311 gallons of molasses. There were 1,256 horses, 643 mules and asses, 2,737 milch cows, 1,238 working oxen, 3,763 other cattle, 4,205 sheep, and 12,920 swine. Capital, Decatur. **III.** A S. E. county of Texas, separated from Louisiana by the Sabine river and drained by its branches; area, 964 sq. m.; pop. in 1870, 2,187, of whom 831 were colored. The surface is undulating toward the south and somewhat hilly in the north. The soil of the bottom lands is highly productive, but much of the upland is poor and sandy. Timber is abundant. The chief productions in 1870 were 51,303 bushels of Indian corn, 11,890 of sweet potatoes, 1,001 bales of cotton, and 4,574 gallons of molasses. There were 556 horses, 1,370 milch cows, 6,208 other cattle, 1,456 sheep, and 4,331 swine. Capital, Newton. **IV.** A N. W. county of Ar

kansas, drained by the Buffalo fork of White river and its head branches; area, about 900 sq. m.; pop. in 1870, 4,374, of whom 9 were colored. It has a diversified surface, much of it still covered with forests, and a generally fertile soil. The chief productions in 1870 were 9,830 bushels of wheat, 169,825 of Indian corn, 13,645 lbs. of tobacco, 43,292 of butter, 14,019 of honey, and 3,472 gallons of sorghum molasses. There were 1,148 horses, 1,232 milch cows, 781 working oxen, 1,549 other cattle, 2,355 sheep, and 14,126 swine. Capital, Jasper. **V.** A N. W. county of Indiana, bordering on Illinois, bounded N. by the Kankakee river, and intersected in the S. by the Iroquois; area, about 400 sq. m.; pop. in 1870, 5,829. Beaver lake, a considerable body of water, is in the N. part. The surface is level, and in parts swampy. It is traversed by the Pittsburgh, Cincinnati, and St. Louis railroad. The chief productions in 1870 were 23,802 bushels of wheat, 142,096 of Indian corn, 111,333 of oats, 18,855 of potatoes, 8,456 lbs. of wool, 155,755 of butter, and 14,854 tons of hay. There were 2,814 horses, 2,362 milch cows, 6,987 other cattle, 3,320 sheep, and 4,995 swine. Capital, Kentland. **VI.** A S. W. county of Missouri, bordering on Kansas and the Indian territory, and drained by branches of the Grand or Neosho river; area, about 750 sq. m.; pop. in 1870, 12,821, of whom 350 were colored. It is intersected by the Atlantic and Pacific railroad. The chief productions in 1870 were 67,725 bushels of wheat, 359,945 of Indian corn, 81,045 of oats, 26,982 of Irish and 6,879 of sweet potatoes, 16,480 lbs. of tobacco, 10,387 of wool, 90,824 of butter, and 15,619 gallons of sorghum molasses. There were 3,134 horses, 2,496 milch cows, 894 working oxen, 4,072 other cattle, 6,511 sheep, and 16,077 swine; 5 flour mills, 6 saw mills, and 1 manufactory of pig lead. Capital, Neosho.

NEWTON, a city of Middlesex co., Massachusetts, on a curve of the Charles river, which bounds it N., W., and S., and on the Boston and Albany and the Boston, Hartford, and Erie railroads, 8 m. W. of Boston; pop. in 1840, 3,351; in 1850, 5,258; in 1860, 8,382; in 1870, 12,825; in 1875, estimated at 17,000. The surface is high and undulating, the scenery beautiful, and the situation healthy. The city is divided into six wards, and contains nine post villages, viz.: Auburndale, Chestnut Hill, Newton, Newton Centre, Newton Highlands, Newton Lower Falls, Newton Upper Falls, Newtonville, and West Newton. There are ten railroad stations. Near the centre of the city there is a cemetery, with a diversified surface partly improved, embracing 82 acres. Many of the residents do business in Boston, but considerable manufacturing is carried on in the city, the river furnishing extensive water power at the upper and lower falls. The principal articles produced are braid and cordage, boots and shoes, carriages, print cloths, dye stuffs, emery cloth, glue, hosiery, ornamental goods, photograph frames, ink, paper,

shoddy, soap, and rolling mill products. There are a national and a savings bank. The city is lighted with gas and has a fire department. The valuation of property in 1872 was \$24,256,854; in 1874, \$28,081,445; city debt at the close of 1874, \$387,000. At Newton Centre is the Newton theological institution, founded by the Baptists in 1826. The buildings occupy the summit of a hill commanding a fine view. The regular course is three years. Tuition and room rent are free. In 1873-'4 it had 5 resident professors, 1 other instructor, 72 students, and a library of 12,000 volumes. Lasell female seminary, at Auburndale, established in 1851, is beautifully situated, and embraces instruction in the English branches and a four years' classical course. In 1873-'4 it had 11 instructors and 42 students. The most important of the other educational institutions is the English and classical school at West Newton, established in 1854. The public schools embrace a high, a training, 8 grammar, and 8 primary schools, and have an average attendance of about 2,000 pupils. There are several libraries: the free library, with 8,500 volumes; the Athenæum library; the Newton Centre library, 1,500 volumes; and the Lower Falls library, 1,500 volumes. The city has two weekly newspapers, two asylums for male and female orphans and destitute children, and 25 churches, viz.: 4 Baptist, 7 Congregational, 3 Episcopal, 5 Methodist, 2 Roman Catholic, 1 Swedenborgian, 2 Unitarian, and 1 Universalist.—Newton was settled in 1630, and was incorporated as a town in 1679. A city charter was granted in 1873.

NEWTON, Alfred P. See supplement.

NEWTON, Charles Thomas, an English archæologist, born in Herefordshire in 1816. He graduated at Oxford in 1837, and from 1840 to 1852 was an assistant in the department of antiquities in the British museum. In 1856, while vice consul at Mytilene, he discovered at Boodroom (anc. Halicarnassus) the site of the Mausoleum. (See HALICARNASSUS.) He was engaged in other interesting excavations from 1856 to 1859, and enriched the British museum with numerous sculptures, inscriptions, vases, coins, and other relics. In 1860 he became consul at Rome, and in 1861 keeper of the Greek and Roman antiquities in the British museum. His wife, who was known as an artist, died Jan. 2, 1866.

NEWTON, Gilbert Stuart, an English painter, born in Halifax, Nova Scotia, Nov. 2, 1794, died in Chelsea, England, Aug. 3, 1835. On the death of his father he removed in 1803 with his mother to Boston, and was instructed in painting by his maternal uncle, Gilbert Stuart. About 1816 he went to Italy; and after studying a while at Florence and elsewhere, he went in 1817 to London and became a student in the royal academy. Here he formed an intimacy with Charles R. Leslie and Washington Irving. He early adopted a style founded on that of Watteau, and attracted

notice by his "Forsaken" and "Lovers' Quarrel," from Molière's *Dépôt amoureux*, which were engraved for the "Literary Souvenir" of 1826. Among his other works are "Shylock and Jessica," "Yorick and the Grisette," "The Abbot Boniface," "A Poet reading his Verses to an impatient Gallant," "Macheath," "Lear attended by Cordelia and the Physician," "The Vicar of Wakefield restoring Olivia to her Mother," and "Abélard in his Study," most of which have been engraved. He was elected a member of the academy in 1833. In 1832 he revisited the United States. Shortly after his return in 1833 he exhibited symptoms of mental aberration, and the last two years of his life were passed in a lunatic asylum.

NEWTON, Sir *Isaac*, an English philosopher, born at Woolthorpe, Lincolnshire, Dec. 25, 1642, died in Kensington, a suburb of London, March 20, 1727. He was a posthumous and only child, like Kepler, and was born prematurely. He was descended, according to his own account, from Sir John Newton of Westby in Lincolnshire, and according to another from a Scotch family in East Lothian. When he was three years of age, his mother, having married again, gave him to the charge of his maternal grandmother. He went to school at Skillington and Stoke till his 12th year, when he was sent to the free school at Grantham, six miles from his native hamlet, taught by a Mr. Stokes. He ranked low in his classes for some time, but being ill treated by the boy who stood next above him he determined to defeat his opponent in class work, and applied himself with such resolution to his books that he at length stood at the head of the whole school. He was usually less interested in the sports of his schoolmates than in constructing little mechanical contrivances, in which he showed marked facility of imitation and invention. He arranged a set of pins or gnomons upon the adjacent houses so as to mark the time of day by their shadows; the arrangement served as a sort of town clock, and was known as "Isaac's dial." On the outside wall of his house at Woolthorpe there is still a sun dial which he must have carved there. There were formerly two, but the stone on which the other was cut was removed in 1844 and presented to the royal society. In 1656 his mother, again a widow, took him to help in the management of the farm at Woolthorpe; but such was his passion for study that he found little time to look after the concerns of the farm. His mother sent him back to Grantham, where he was fitted to enter Trinity college, Cambridge, in 1661. It does not appear that he showed a marked preëminence in the studies of the university, but he extended his acquirements beyond the prescribed routine in several directions. In the winter of the year in which he was elected scholar (1664), or earlier, he invented his binomial theorem, to which he had been led by investigations into the problem of the quadrature of the circle,

and directed his attention to the subject of circles or halos around the moon, of which he gave the theory in his treatise on optics. In 1665 he took the degree of B. A., and probably in the same year invented fluxions.—At this period the thoughts of philosophers were strongly directed to the telescope. Huygens had constructed instruments which revealed the rings and satellites of Saturn. Descartes had explained the theory of refraction, and had pointed out how glasses could be ground of such a shape as to unite parallel rays of light in a focus. Still these glasses had the great defect of giving a confused image, which was thought to be owing to imperfect manufacture, and Newton applied himself to grinding them with more accuracy. But he also experimented with a ray of light, and soon came to the conclusion "that light was not homogeneous, but composed of rays, some of which were more refrangible than others." This showed him that the defect of the lens of the refracting telescope was inherent and not accidental. He accordingly abandoned his attempts to improve that instrument, and devoted himself to the construction of a reflecting telescope, which James Gregory of Aberdeen, in view of the defects of the refracting medium, had already invented. While Newton was engaged on this, the plague forced him to retire to Woolthorpe (1666), and it was more than two years before he resumed his researches. During his retreat at Woolthorpe (whether in this or the previous year is uncertain) he first conceived the identity of gravity with the force which holds the planets to their orbits, and made his first test calculations; but, starting with the erroneous estimate then entertained of the earth's mass, he failed to verify the happy conjecture (see *ASTRONOMY*); and it was not till about 1680 that he resumed work upon the problem. On the cessation of the plague he returned to Cambridge, was made junior fellow in October, 1667, and senior fellow in March, 1668, and graduated M. A. in July of the same year. In the autumn of 1668 he completed a reflecting telescope 6 in. in length, magnifying 40 times, which enabled him to see Jupiter's satellites and the phases of Venus. This was the first reflecting telescope ever directed to the heavens, for Gregory never completed the instrument which he had invented. Compared with the much earlier refractors of Hevelius and Huygens, however, this was a small and ill-made instrument. In the autumn of 1671 Newton made another, which was sent up in December "for his majesty's perusal." It is carefully preserved in the library of the royal society of London. His mind appears to have been much occupied at this time and for many years afterward with "chemical studies and practices." His celebrated letter (1669) of advice to Mr. Aston, who was about to set out for a tour of the continent, reveals a strong belief in the doctrines of alchemy; and he cer-

taily pursued his experiments to a late period of his life in the hope of effecting some valuable transmutations.—In 1669 he became Lucasian professor of mathematics at Cambridge, and during that and the next year spent considerable time in writing notes for a Latin translation of Kinckhuysen's algebra. In 1669–72 he delivered a course of lectures on optics in the university, and from time to time communicated to the royal society the results of his researches on light and colors. The new doctrine of the compound nature of light involved Newton in a long and acrimonious controversy both at home and abroad. Newton considered light to consist of material particles. Hooke believed it to result from a series of undulations of an elastic medium pervading all bodies. With this theory, which Huygens maintained in common with Hooke, Newton's alleged discovery seemed incompatible, and was accordingly strenuously resisted. On the other side Newton himself rejected Huygens's beautiful law of double refraction in Iceland spar, "founded on the finest experimental analysis of the phenomena," because it was presented as a corollary of the undulatory theory. Hooke in the one case, and Newton in the other, failed alike to see, or refused to admit, that the principle in question was true or false independently of what light is, or how it is propagated. It is remarkable that Newton should have missed, in the course of his optical experiments and the controversy which followed, the discovery of the different dispersive powers of different bodies. The opinion that all bodies produce spectra of equal length under the same angle of refraction, though "unsupported by experiments," observes Brewster, "and not even sustained by any theoretical views, seems to have been impressed upon his mind with all the force of an axiom; and when, under the influence of this blind conviction, he pronounced the improvement of the refracting telescope to be desperate, he checked for a long time the progress of this branch of science, and furnished to future philosophers a lesson which cannot be too deeply studied." From 1671 to 1676 his optical researches and the disputes in which they involved him seem to have occupied most of his time. He wrote to Leibnitz, Dec. 9, 1675: "I was so persecuted with discussions arising out of my theory of light, that I blamed my own imprudence for parting with so substantial a blessing as my quiet to run after a shadow." In January, 1672, he was elected fellow of the royal society; but he offered his resignation in March, 1673, on the ground of being unable to attend the meetings. An interesting document in Newton's handwriting, entitled "A Scheme for establishing the Royal Society," has been brought to light by Sir David Brewster. His desire, it seems, was to convert the royal society into an institution like the academy of sciences in Paris. On Dec. 9, 1675, he sent to the society his "Hypothesis

explaining the Properties of Light" (reprinted in the "Philosophical Magazine," September, 1846), and his "Explanation of the Colors of Thin Plates and of Natural Bodies," which Brewster says "is perhaps the loftiest of all his speculations." The phenomena of colors he ascribes to a supposed property of light, which he calls "fits of easy reflection and transmission." The theory is that every particle of light, from its first discharge from a luminous body, possesses, at equally distant intervals, dispositions to be reflected from and transmitted through the surfaces of bodies upon which it is incident. This appears to have been his last communication to the society on optical subjects. In 1704 he published his great work on optics; much of it was written as early as 1675, and most of the remainder about 1687.—In 1679 Newton's attention was recalled to the subject of universal gravitation by a letter from Hooke, who declared that "if gravity decreased according to the reciprocal of the square of the distance, the path of a projectile would be an ellipse having the centre of the earth in the focus." Newton had hitherto confined his researches to bodies revolving in circular orbits. He now demonstrated the mathematical necessity of the three laws of Kepler as applied to the motion of a body projected in free space, and acted upon continually by a force directed toward the focus and varying inversely as the square of the distance. Newton could not consider the law of gravitation established so long as the serious discrepancy found in his calculations upon the moon remained unaccounted for. In 1680, hearing of a new measurement of a degree of the meridian by Picard, the French astronomer, which differed materially from the commonly received estimate, he went over the calculation again on the basis of the new measure, and the result was in exact agreement with observation. He perceived that the earth, by its axial rotation and the mutual attraction of the particles of matter composing its mass, must be flattened at the poles, and he determined the amount of this flattening, though according to an incorrect law for the variation of the earth's density. He showed that the spheroidal figure of the earth, combined with its diurnal motion, would cause the weights of bodies at the surface to vary in different latitudes; and this result of pure theory explained a singular fact first noticed by the French astronomer Richer, who in 1672 had found that a clock regulated to mean time of Paris lost 2m. 28s. daily at Cayenne, within 5° of the equator. This led him to an explanation of the precession of the equinoxes. Kepler and others before him had spoken of an attraction of the waters of the earth by the moon. Newton explained the tides. He saw that the masses of the planetary bodies could be determined by observing the effects of their mutual attraction, and that from this cause their several motions would be disturbed. Thus he was conducted to an

elucidation of the intricate subject of the moon's motions, which had long been a stumbling-block to astronomers. He deduced theoretically the two lunar inequalities known as the variation and the annual equation, and also the progression of the apogee and the regression of the nodes, though it was reserved for the mathematicians of the next century to complete the lunar theory. It is not known that he made any public announcement of his discoveries before February, 1685, when he sent to the royal society a paper containing his early researches on centripetal forces. Halley, who had endeavored in 1684 to calculate the law of the solar force directed to the planets moving in elliptical orbits, consulted Newton, and, finding that he had gone over the whole ground, induced him to communicate to the royal society the paper already alluded to. On its presentation Hooke raised a violent reclamation relative to the asserted discovery of the law of gravitation. As early as 1666 he had arrived at very accurate notions of centripetal forces. He had published in 1674 "An Attempt to prove the Motion of Earth from Observations," in which, as Mr. Grant observes, he describes the general nature of gravity with remarkable clearness and accuracy. (There is a Latin translation of this work, printed in 1679.) But he had not attempted to compute the law of the variation of the force at different distances from the centre, which, as applied to the elliptical orbits of the planets, was the very problem which Newton had solved. The pretensions of Hooke called forth from Newton a long letter, dated June 20, 1686, in which he recounts the progress of his researches, and intimates his resolution to suppress the third book of his *Principia* rather than have his peace of mind disturbed by a controversy with envious rivals. By Halley's persuasion, however, Newton consented to let the whole appear. In April, 1686, the first book of the *Principia* was exhibited at the royal society; in June Halley undertook its publication at his own expense, although it involved him in considerable pecuniary risk; and it appeared the next year, bearing the following title page: *Philosophiæ Naturalis Principia Mathematica. Imprimatur Julii 5, 1686. Londini, 1687.* It is divided into three books. The first treats of motion in free space; the second treats chiefly of resisted motion; and the third deduces from these the system of the world. The doctrines of the *Principia*, like all discoveries which tend to overthrow cherished opinions, were hotly combated for many years. The philosophy of Descartes, which the Newtonian theories at length supplanted, was predominant throughout Europe; and Voltaire said that at the time of his death Newton had not more than 20 followers outside of England. "The language of the French mathematicians," observes the author of the "History of the Inductive Sciences," "is Cartesian for almost half a century after

the publication of the *Principia* of Newton." "The profound and intricate reasoning which Newton was compelled to adopt," says Mr. Grant, "formed a serious impediment to the early dissemination of his doctrines." The British universities, however, early introduced the Newtonian philosophy as a subject of study. The university of St. Andrews in Scotland took the lead in 1690, followed by Cambridge in 1699, and by Oxford in 1704. Dr. Bentley made the new principles the basis of a theological argument in the Boyle lectures preached in London in 1692-'3.—After the publication of the *Principia*, Newton was content to extend and develop the principles of his philosophy without advancing into any new fields of science; and even these developments appear to have been based for the most part on experiments and observations previously made. He was elected to represent the university in parliament in 1689, and again in 1701; and though he was rejected in 1705, those who opposed him acknowledged him to be "the glory of the university," but considered that he was sent to "tempt them from their duty by the great and just veneration they had for him." On the dissolution of parliament in 1690 he resumed his philosophical and mathematical studies at Cambridge. After this his health became impaired. In December, 1692, and January and February, 1693, he wrote the four celebrated letters to Dr. Bentley on the existence of a Deity. He was greatly affected about the beginning of 1692 by the loss of valuable manuscripts, which were consumed in his study by the upsetting of a candle. The notable story of his little dog Diamond having occasioned the mischief, and of Newton's remarkable equanimity on seeing what had happened, Brewster considers a fiction. In a letter to Pepys, dated Sept. 13, 1693, and one to Locke about the same time, there are evidences of loss of judgment. A fortnight after the former was written, Newton told a common friend "that he had writ a very odd letter to Pepys, at which he was much concerned;" adding "that it was in a distemper that much seized his head, and that kept him awake for above five nights together." Not many days after his painful letter to Locke was written he wrote again with child-like simplicity and tenderness, asking to be forgiven for thinking ill of him, and subscribing himself, "Your most humble and unfortunate servant." About this time began the celebrated quarrel between Newton and Flamsteed, the astronomer royal, which was only terminated by Flamsteed's death (1719). They had been on terms of cordial intimacy till 1696, when a coolness began to spring up. Newton was engaged on his lunar theory, and required observations of the moon's places. Flamsteed, who at his own expense had put himself in possession of the proper instruments, was the only one who could furnish the observations. They were supplied, though not as promptly as Newton

wished. Complaint followed, with little outbreaks of temper on both sides. Newton was at the summit of his fame, and Flamsteed saw the vast importance of his own labors, then unappreciated, but since fully allowed. Halley, devoted to Newton, embittered the difference. The quarrel culminated in the publication, under Halley's name, of Flamsteed's celestial observations, which Halley had mutilated. (See FLAMSTEED.) Newton received in 1695 the appointment of warden of the mint, worth between £500 and £600 a year; and in 1699 he was promoted to the mastership of the mint, worth £1,200 to £1,500, which office he held during the rest of his life. The chancellor of the exchequer declared that he could not have carried on the recoinage of 1699 without his assistance. On his promotion he appointed Mr. Whiston to be his deputy at Cambridge, with the full profits of the place; and in 1701 he resigned the chair. In 1699 he was elected foreign associate of the academy of sciences at Paris. He was chosen president of the royal society in 1703, and annually reelected during his life. In 1705 he was knighted by Queen Anne. In 1713 he communicated a paper to the royal society on the different kinds of years in use among the nations of antiquity; it was published in the "Gentleman's Magazine" for January, 1715, and the original is in the British museum. In 1717 he prepared two reports on the state of the coinage, which were laid before the houses of parliament. They were followed by a proclamation in December, 1717, reducing the value of guineas from 21*s.* 6*d.* to 21*s.*—In 1705 began the famous dispute with Leibnitz. Newton and Leibnitz, it is now clear, were both original inventors of the infinitesimal analysis, Newton being the earlier. But Leibnitz published his method in 1684, while Newton's did not appear till 1687. The geometry of the former spread rapidly over Europe; he was considered as the sole inventor, and Newton, in the first edition of the *Principia*, acknowledged his claims as an independent inventor. In 1699 a remark was dropped in the royal society casting suspicion upon the originality of Leibnitz's discovery. Leibnitz replied in the *Leipsic Journal* without asperity, asserting his claim. On Jan. 1, 1705, the same publication criticised with marked severity Newton's "Quadrature of Curves," then lately published, in which the method of fluxions was for the first time announced to the world, asserting in effect that the fluxionary method was not an original discovery. Newton and his friends were justly indignant, and Keill, an astronomer, undertook his defence, but was betrayed into doing similar injustice to Leibnitz, charging him in effect with having borrowed his calculus from hints thrown out by Newton. Leibnitz appealed to the royal society, which appointed a commission in the premises. Their report, which vindicates Newton's claims, forms what is called the *Commercium Epistolicum* (1712); for the con-

tents of which, as also of a second edition with a review entitled *Recensio* (1722), Newton was himself fully responsible. In a new edition, edited by MM. Biot and Lefort (4to, Paris, 1856), this report is shown to be in many points unfair. The dissension continued without abatement up to Leibnitz's death (1716). Newton published soon after what Biot characterizes as a "bitter refutation." In the first edition of the *Principia* (book ii., scholium to lemma 2) justice was done to Leibnitz's claim. In the third edition (1725) another scholium is substituted, in which Leibnitz's name is not mentioned.—During his residence at Cambridge Newton was in the habit, as he expresses it, "of refreshing himself with history and chronology when he was weary with other studies." Hence grew up a system of chronology, which however was very imperfect and only existed in separate papers till the princess of Wales (afterward queen consort of George II.), who enjoyed the privilege of his conversation during the latter part of his life, requested a copy of it for her private use. The manuscript after some years was printed in Paris (1725) surreptitiously, and involved Newton in an annoying controversy, in consequence of which he was induced to prepare a larger work, which was interrupted by his death. It appeared toward the end of 1727, under the title, "The Chronology of Ancient Kingdoms amended, to which is prefixed a Short Chronicle from the first Memory of Things in Europe to the Conquest of Persia by Alexander the Great." His system was based on the astronomical observations of the ancients.—Previous to 1692 Newton was known by the appellation of an "excellent divine." It is therefore probable that his posthumous papers on religious subjects were composed in the prime of life, at Cambridge. His "Observations on the Prophecies of Daniel and the Apocalypse of St. John" appeared in London in 1733 (4to). His "Historical Account of two Notable Corruptions of Scripture," mainly composed prior to 1690, but finished in that year, was first published in 1754, under the erroneous title of "Two Letters from Sir Isaac Newton to M. Le Clerc." In some catalogues of Newton's works another edition is mentioned, entitled "Two Letters to Mr. Clarke, late Divinity Professor of the Remonstrants in Holland" (1734). It appears to have been first published entire in Horsley's edition of Newton's works, under the title; "Historical Account of two Notable Corruptions of Scripture, in a Letter to a Friend." That friend was probably Locke. In this work he considers the two noted texts, 1 John v. 7, and 1 Tim. iii. 16. The former he attempts to prove spurious, and the latter he considers a false reading. The publication of several of his private papers in Sir David Brewster's memoir places the fact of his entertaining Arian opinions beyond question. About the beginning of 1691 Locke contemplated going to Holland,

and Newton sent him the above mentioned tract in strict confidence, requesting him to take it with him and procure its translation and publication in French, anonymously, as is evident; the object being apparently to ascertain the judgment of Biblical critics before bringing it out under his own name in English. Locke abandoned his intention of visiting Holland, but sent the manuscript to his friend Le Clerc in that country, who in January of the next year informed Locke that he was about to publish it in Latin. Newton, hearing of this, became alarmed at the risk of detection, and stopped the publication. He left many manuscripts on religious subjects, which have never been published. Besides a Latin dissertation on the sacred cubit of the Jews, printed in 1737 among the miscellaneous works of Mr. John Greaves, Newton's only other published religious writings are the four celebrated letters addressed to Dr. Bentley, first printed in 1756. They are directed against atheism, and aim to show that matter could never have arrayed itself in its present forms without a divine power being impressed upon it. Except a short tract on the nature of acids, his only chemical paper is one printed in the "Philosophical Transactions" for March and April, 1701, under the title of *Scala Graduum Caloris*. It contains a comparative scale of temperatures, from that of melting ice to that of a small kitchen coal fire. To the second English edition of the "Optics" are appended several queries, the 18th and 24th of which contain his opinions in favor of the existence of an elastic ether diffused through all space, "much subtler than air."—During the last 20 years of his life, which he spent in London, the charge of his domestic concerns, as he was never married, devolved upon his niece, Mrs. Catharine Conduitt. For two or three years prior to 1725 he had been troubled with a disorder of the bladder, accompanied with cough and gout. In January of that year he was seized with a violent cough and inflammation of the lungs, in consequence of which he removed his residence to Kensington, where his health improved. From this time the duties of his office at the mint were discharged by Mr. Conduitt. On Feb. 28, 1727, he went to London to preside at a meeting of the royal society, and became greatly fatigued. His old complaint returned with increased violence, and soon proved fatal. He was buried with great pomp in Westminster abbey, where a monument to him was erected in 1731. Though he had accumulated a personal estate worth at his death £32,000, he does not appear to have lived narrowly. He often evinced great generosity; to his relatives in particular he was lavish. He was of medium stature, and in the latter part of his life inclined to corpulency. In old age he had a fine head of hair, as white as silver, without any baldness. He never wore spectacles, and it is said he

never lost more than one tooth to the day of his death. The house in which Newton was born was purchased in 1858 by Miss Charlwood of Grantham, to be pulled down, that a scientific college might be erected on its site. His statue was inaugurated at Grantham, Sept. 21, 1858. His dwelling house, with an observatory which he built on the top, still remains in St. Martin's street, London, and is a place of scientific pilgrimage.—Besides the first edition of the *Principia* above noticed, a second was published at Cambridge in 1713, under the superintendence of Cotes, whose correspondence with Newton at the time has been published (London, 1850), under the editorship of Mr. Edleston. A third edition appeared in London in 1726 (4to), edited by Pemberton; a fourth in 1729 (2 vols. 8vo), Englished by Motte; and a fifth in 1730 (2 vols. 8vo). Several editions have been published on the continent, the most famous of which is the Jesuits' edition (4 vols. 4to, Geneva, 1739-'42), republished in Glasgow under the editorship of Wright (4 vols. 8vo, 1822). A Latin translation of the "Optics," by Dr. Clarke, appeared in 1706 (4to), for which Newton presented the translator with £500. Many other editions have been published. Of his "Universal Arithmetic" there are several editions, both English and continental. The "Optical Lectures" appeared in 1728; "Fluxions," with a commentary, in 1736. His principal works were collected by Bishop Horsley (5 vols. 4to, London, 1779-'85). His communications to the royal society are comprised in vols. vii. to xi. of the "Transactions."—See Sir David Brewster's "Memoirs of the Life, Writings, and Discoveries of Sir Isaac Newton" (2 vols., 1855; new ed., revised by W. T. Lynn, 1875).

NEWTON, John, an English clergyman, born in London, July 24, 1725, died there, Dec. 31, 1807. While a boy he accompanied his father, who was master of a ship, to the Mediterranean, and subsequently made several voyages. In his 19th year he was seized by a press gang and taken on board the Harwich man-of-war, where he was made a midshipman. While the ship lay at Plymouth he deserted, but was soon caught, flogged, degraded, and treated with such severity that he willingly exchanged into an African trader off Madeira. He left this ship at Sierra Leone, and hiring himself out as a laborer to a slave trader in the island of Benaoes, he remained there till 1747, when an English captain arrived at Sierra Leone, commissioned by his father to bring him back. Shortly afterward he commanded a Liverpool slave ship, was engaged in that business four years, and confesses that, during all the time he was in it, "he never had the least scruples as to its lawfulness." But growing disgusted with the occupation, he obtained in August, 1755, the situation of surveyor of the port of Liverpool. While in Africa he had studied Euclid; during his voyages had taught himself Latin; and he now devoted himself to acquiring Greek

and Hebrew. He engaged zealously in the religious movement originated by Wesley and Whitefield, and in 1758 applied to the archbishop of York for holy orders, but was refused on the ground of irregularity. In April, 1764, however, he was ordained by the bishop of Lincoln and appointed curate of Olney in Buckinghamshire, and shortly afterward published "An Authentic Narrative of some Remarkable and Interesting Particulars in the Life of the Rev. John Newton." At Olney he remained nearly 16 years, forming a close friendship with Cowper, in conjunction with whom he wrote the "Olney Hymns." In 1779 he was presented with the rectory of the united parishes of St. Mary Woolnoth and St. Mary Woolchurch Haw, Lombard street, London, where he remained till his death, preaching three times a week even when more than 80 years old. He was a Calvinist, and was a prominent leader in the so-called evangelical party in the church of England. Among his works are a volume of "Six Discourses" (1760); a series of "Letters on Religion" (1762), under the signatures of Omicron and Vigil; "Cardiphonia;" and a "Review of Ecclesiastical History" (1770), besides numerous sermons and tracts. A collected edition of his works was published in 1816 (6 vols. 8vo, London). His life was written by the Rev. Richard Cecil (London, 1808); and several of his letters to Cowper are published in Southey's edition of the life and works of that poet.

NEWTON, Robert, an English clergyman, born at Roxby, Yorkshire, Sept. 8, 1780, died April 30, 1854. With a limited education he began to preach in 1798, and in 1799 was received into the British conference. In 1803 he was appointed to Glasgow circuit, where he attended lectures in the university on theology and philosophy. While he received his appointments regularly from the conference, most of his time was spent in special labors in various parts of England and Scotland. His appointment to London in 1812 brought his extraordinary pulpit talents more prominently before the public, and he was employed with great success in advocating the cause of the British and foreign Bible society. He was also associated with Thomas Coke in promoting the cause of Christian missions. The demands for his labors throughout England, Scotland, and Ireland were extraordinary. During more than 50 years he probably travelled more continuously in the interests of the church than any other man of the century. He was four times elected president of the British conference, and for many years acted as its secretary. In 1839 he was sent as delegate of the British conference to the Methodist Episcopal church of the United States, and during this stay his marvellous eloquence attracted vast crowds.

NEWTON, Thomas, an English bishop, born in Lichfield, Jan. 1, 1704, died Feb. 14, 1782. He graduated at Trinity college, Cambridge,

took orders in 1729, received the curacy of St. George's, Hanover square, London, and afterward that of Grosvenor chapel, and in 1744 was presented by the earl of Bath to the rectory of St. Mary-le-Bow. He was chosen in 1747 lecturer of St. George's, Hanover square. In 1761 he became bishop of Bristol, and in 1768 dean of St. Paul's. In 1749-'52 he published the first critical edition of Milton's "Poetical Works" with variorum notes (3 vols. 4to). His "Dissertations on the Prophecies" (3 vols. 8vo, 1754-'8) became very popular, and were translated into German and Danish. A collected edition of his writings appeared in 1783 (3 vols. 4to, London).

NEW WESTMINSTER, a city and till 1867 the capital of British Columbia, on the N. bank of Fraser river, 15 m. above its mouth in the gulf of Georgia, and 65 m. N. N. E. of Victoria; lat. 49° 13' N., lon. 122° 53' W.; pop. about 2,000, including some Indians. It has a magnificent site, and an equable and delightful climate. In the river (here about a mile wide) are several islands, most of them inhabited. Within a few miles are extensive deposits of silver, which have not been worked. Steamers run to Yale, the head of navigation, 100 m. above, and there is a semi-weekly line to Victoria. Salmon fishing is the principal industry, five large establishments being engaged in it, and shipping annually large quantities of canned and barrelled salmon to all parts of the world. The principal buildings are the court house, council hall, post office, library, masonic and odd fellows' halls, and the penitentiary in course of erection. The Episcopal church has a fine peal of bells, and there are also a Presbyterian, a Roman Catholic, and two Wesleyan Methodist churches. The city has two common schools, a Catholic college for boys, a young ladies' school conducted by the sisters of St. Anne, a hospital, a savings bank, a telegraph office, and a semi-weekly newspaper.

NEW YEAR'S DAY, the first day of the year. Ancient and modern civilized peoples, while differing as to the day from which they reckoned the beginning of the civil year (see **YEAR**), have agreed in distinguishing it by special festivities. The Romans dedicated the day and the whole ensuing month to Janus, offered sacrifices to him on 12 altars, and were careful so to order their conduct on that day that every word and action should be a happy augury of the 12 months of the year. They exchanged kindly greetings and wishes, and sent to their kinsfolk, friends, and acquaintance presents called *strenæ*. These new year's presents became under the Cæsars such a source of personal profit to the sovereign, and so onerous to his subjects, that Claudius limited them by a decree. The first Christian emperors kept up the custom, though still accompanied by many idolatrous rites. The church condemned it, prohibited Christians from joining in the social celebration, and ended by making it a religious festival in memory of the circumcision of Christ.

The bestowal of gifts upon new year's day was not peculiar to the Romans. The druids distributed branches of the sacred mistletoe, cut with peculiar ceremonies, as new year's gifts among the people; and the Saxons of the north, according to Bishop Stillingfleet, observed the festival with feasting and sending gifts. Henry III. of England is said to have extorted new year's gifts, and Queen Elizabeth's wardrobe and jewelry were probably almost wholly supplied from these contributions. Dr. Drake says that, although the queen made returns to the new year's gifts in plate and other articles, she took care that the balance should be in her own favor. As late as 1692, as appears from the "Monthly Miscellany" for December of that year, the English nobility were accustomed, "every new year's tide," to "send to the king a purse with gold in it." In England the ringing in the new year from the belfries of churches is now the only open demonstration of joy at the recurrence of the anniversary. In the city of New York the day is made the occasion of social visits by gentlemen, a custom dating back to the settlement of the town by the Dutch; and the practice has become prevalent in many parts of the United States.—The Jews celebrate their new year's festival (*Rosh hashshannah*) at the beginning of the month of Tishri (September–October), the first of the civil year corresponding to the seventh of the Mosaic or ecclesiastical. The distinguishing feature of the celebration in the synagogues is the blowing of horns, in accordance with Leviticus xxiii. 24. Among the Chinese the new year's celebration, continued for three days, is the greatest festival of the year. Preparatory to it, all accounts are settled and debts paid so far as possible; and tradesmen who cannot pay their debts are generally obliged to give up all their property to their creditors. On new year's day calls are made upon friends, joyous greetings are exchanged in the streets, paper prayers are offered in the temples, fireworks are burned, gongs are beaten, and a general hubbub prevails. At night gambling is practised to an enormous extent.

NEW YORK, one of the thirteen original states of the American Union, and one of the middle states, situated between lat. 40° 29' 40" and 45° 0' 42" N., and lon. 71° 51' and 79° 45' 54" W.; extreme length E. and W., 412 m.; breadth varying from 8 or 10 m. on Long island, and 18½ m. at the W. extremity of the state, to 31½ m. from the Canada boundary to the S. point of Staten island; area, 47,000 sq. m. It is bounded N. and N. W. by Lake Ontario and the St. Lawrence river, and again N. by Canada along the parallel of 45° from the St. Lawrence to the head of Lake Champlain; E. by Vermont (separated in part by Lake Champlain), Massachusetts, Connecticut, and the Atlantic ocean; S. by the Atlantic, New Jersey, and Pennsylvania; and W. by Pennsylvania, Lake Erie, and the Niagara river. It is divided into 60 counties, viz.: Albany, Allegany,

Broome, Cattaraugus, Cayuga, Chautauqua, Chemung, Chenango, Clinton, Columbia, Cortland, Delaware, Dutchess, Erie, Essex, Franklin, Fulton, Genesee, Greene, Hamilton, Herkimer, Jefferson, Kings, Lewis, Livingston, Madison, Monroe, Montgomery, New York, Niagara, Oneida, Onondaga, Ontario, Orange, Orleans, Oswego, Otsego, Putnam, Queens, Rensselaer, Richmond, Rockland, St. Lawrence, Saratoga, Schenectady, Schoharie, Schuyler, Seneca, Steuben, Suffolk, Sullivan, Tioga, Tompkins, Ulster, Warren, Washington, Wayne, Westchester, Wyoming, and Yates. Albany, the capital, is on the W. bank of the Hudson river, about 140 m. N. of New York city; pop. in 1870, within its present limits, 76,216. The population of New York city in 1870 was 942,292, but recent annexations have increased it, according to the census of that year, to 973,773; its total population in 1874 was about 1,050,000. The other cities of the state, with the number of inhabitants as reported by the federal census of 1870, are: Auburn, 17,225; Binghamton, 12,692; Brooklyn, 396,099; Buffalo, 117,714; Cohoes, 15,357; Elmira, 15,863; Hudson, 8,615; Kingston (1874), about 22,000; Lockport, 12,426; Long Island City (1874), about 16,000; Newburgh, 17,014; Ogdensburg, 10,076; Oswego, 20,910; Poughkeepsie, 20,080; Rochester, 62,386; Rome, 11,000; Schenectady, 11,026; Syracuse, 43,051; Troy, 46,465; Utica, 28,804; Watertown, 9,336; Yonkers (1874), about 16,000.—In population New York surpasses every other state in the Union. Under the colonial government, the number of inhabitants in 1698 was 18,067; 1703, 20,665; 1723, 40,564; 1731, 50,824; 1737, 60,437; 1746, 61,589; 1749, 73,348; 1756, 96,790; 1771, 163,337. The results of the United States decennial censuses have been as follows:

YEARS.	White.	Free colored.	Slave.	Total.	Rank.
1790.....	314,142	4,654	21,324	340,120	5
1800.....	557,731	10,417	20,903	589,051	3
1810.....	918,699	25,333	15,017	959,049	2
1820.....	1,392,744	29,279	10,088	1,372,111	1
1830.....	1,873,663	44,870	75	1,918,608	1
1840.....	2,378,890	50,027	4	2,428,921	1
1850.....	3,048,325	49,069	3,097,394	1
1860.....	3,831,590	49,005	3,880,735	1
1870.....	4,380,210	52,051	4,382,759	1

Included in the total of 1860 were 140 Indians, and in that of 1870, 439 Indians and 29 Chinese. Censuses have also been taken by the state as follows: 1814 (total population), 1,035,910; 1825, 1,614,456; 1835, 2,174,517; 1845, 2,604,495; 1855, 3,466,212; 1865, 3,831,777. The population increased from 1698 to 1771, or during a colonial period of 73 years, 804.06 per cent., or at the rate of 11.014 per annum. The increase from 1790 to 1850, or during a period of 60 years, was 810.67 per cent., or 13.51 per annum; 1840 to 1850, 27.52 per cent., or 2.75 per annum; 1850 to 1855, 11.91 per cent., or 2.38 per annum; 1855 to 1860,

OF THE
UNIVERSITY OF ILLINOIS

11.12 per cent., or 2.22 per annum; 1860 to 1865, 12.61 per cent., or 2.52 per annum; 1865 to 1870, 13 per cent., or 2.6 per annum. Of the total population in 1870, 2,163,229 were males and 2,219,530 females; 3,244,406 were native and 1,138,353 foreign born. Of the natives, 2,987,779 were born in the state, 38,851 in Connecticut, 5,985 in Maine, 41,355 in Massachusetts, 4,850 in Michigan, 9,211 in New Hampshire, 32,408 in New Jersey, 36,170 in Pennsylvania, 6,993 in Rhode Island, 36,307 in Vermont, and 7,070 in Virginia and West Virginia. Of the foreigners, 79,042 were born in British America, 110,071 in England, 528,806 in Ireland, 27,282 in Scotland, 7,857 in Wales, 22,302 in France, 316,902 in Germany, 6,426 in Holland, 5,522 in Sweden, 4,061 in Poland, 3,592 in Italy, 818 in Spain, 1,824 in Cuba, and 7,916 in Switzerland. The density of population was 93.25 persons to a square mile. There were 898,772 families, with an average of 4.88 persons to

there were engaged in all occupations 1,491,018, of whom 1,233,979 were males and 257,039 females; in agriculture, 374,323, of whom 134,562 were laborers and 232,649 farmers and planters; in professional and personal services, 405,339, including 5,678 clergymen, 155,150 domestic servants, 931 journalists, 139,309 laborers not specified, 5,913 lawyers, 6,810 physicians and surgeons, and 18,557 teachers not specified; in trade and transportation, 234,581; and in manufactures and mechanical and mining industries, 476,775, of whom 19,291 were blacksmiths, 24,309 boot and shoe makers, 53,046 carpenters and joiners, 11,413 machinists, 16,594 masons, 26,540 milliners and dress and mantua makers, 18,082 painters and varnishers, 10,193 printers, 3,431 ship carpenters, 41,627 tailors, tailoresses, and seamstresses, 11,368 curriers, tanners, and finishers of leather, and 6,869 woollen mill operatives. The total number of deaths during the year was 69,095, being 1.58 per cent. of the entire population. Chief among the causes of mortality were consumption, from which 11,578 persons died, pneumonia, 5,262, and cholera infantum, 3,577; there were 6 deaths from all causes to 1 from consumption, and 13.1 to 1 from pneumonia. There were 1,134 deaths from croup, 1,073 from measles, 582 from smallpox, 864 from diphtheria, 3,403 from scarlet fever, 2,029 from enteric fever, 2,243 from diarrhoea, 1,068 from dysentery, and 1,330 from enteritis. Not included in the census are 5,140 Indians of the Six Nations in New York, on eight reservations, mainly in the extreme S. W. part of the state, of whom 3,060 were Senecas, and the others Saint Regis, Onondagas, Tuscaroras, Oneidas, and Cayugas. They have adopted a civilized life, are intelligent and industrious, and are chiefly engaged in agriculture; 30 schools and an orphan asylum are maintained by the state for their benefit.—The outlines of the state are very irregular, only about one third of the entire boundaries consisting of straight lines. The river, lake, and ocean boundaries are all navigable waters, except 17½ m. on Poughkeepsie river, and consist of 352 m. on Lakes Erie, Ontario, and Champlain, 281 m. on the St. Lawrence, Poughkeepsie, Hudson, Kill van Kull, Delaware, and Niagara rivers, and 246 m. on Long Island sound and the Atlantic ocean; total, 879. The land boundaries along Canada, Vermont, Massachusetts, Connecticut, New Jersey, and Pennsylvania, all made up of straight lines, form a total of 541.28 m. The principal islands belonging to the state are the following: in Niagara river, Grand, Squaw, Strawberry, Rattlesnake, Tonawanda, Beaver, Buckhorn, Cayuga, and Goat; in the St. Lawrence, Carlton, Grenadier, Fox, Wells, Grindstone, a large number of the Thousand islands, and Gallup; in Lake Champlain, Valcour, Crab, and Schuyler; in New York bay, the Atlantic ocean, and Long Island sound, Manhattan, Staten, Long, Gardiner's, Shelter, Plum, Fisher's, all the islands between Long

Seal of the State of New York

each, and 688,559 dwellings, with an average of 6.37 to each, the latter average being larger in New York than in any other state. The number of persons from 5 to 18 years of age was 1,220,988; from 18 to 45, 881,500; male citizens 21 years old and upward, 981,587. There were 163,501 persons 10 years old and over who could not read, and 239,271 unable to write, of whom 70,702 were native and 168,569 foreign born. Of persons 21 years of age and upward, 73,208 white males and 116,744 white females, and 3,912 colored males and 4,874 colored females, were illiterate. The number of paupers supported during the year ending June 1, 1870, was 26,152, at a cost of \$2,661,385; of the total number receiving support at that date (14,100), 5,953 were native and 8,147 foreign born. During the year 5,473 persons were convicted of crime; of the total number (4,704) in prison June 1, 1870, 2,658 were natives and 2,046 foreigners. The state contained 2,213 blind, 1,783 deaf and dumb, 6,353 insane, and 2,486 idiotic. Of the total population 10 years old and over (3,378,959),

island and Connecticut to within a few rods of the Connecticut shore, Hart's, Randall's, Ward's, Blackwell's, Governor's, Bedloe's, and Ellis. The last three are owned by the general government, and occupied as military posts. New York bay and harbor is deep and capacious enough to accommodate all the shipping belonging to and trading with the port of New York. The other principal harbors are Dunkirk and Buffalo, on Lake Erie; Tonawanda and Lewiston, on Niagara river; Genesee, Sodus, Oswego, Sackett's Harbor, and Cape Vincent, on Lake Ontario; Ogdensburg, on the St. Lawrence; Rouse's Point, Plattsburgh, Port Henry, and Whitehall, on Lake Champlain; and Sag Harbor, at the E. end of Long island. The principal river of the state is the Hudson, which is navigable to Troy, 151 m. from its mouth. The Mohawk, the principal affluent of the Hudson, rising in the interior, enters the Hudson at Waterford, descending about 500 ft. in its entire length of 135 m.; it affords extensive water power at Little Falls and Cohoes. Its principal branches are West and East Canada creeks from the north, and Schoharie creek from the south. Oswego river, which receives the waters of all the interior lakes, from Oneida and Cazenovia on the east to Keuka (formerly Crooked) and Canandaigua on the west, furnishes with its branches and tributaries good water power at Penn Yan, on Keuka lake outlet; at Waterloo, Seneca Falls, and Baldwinsville, on Seneca river; at Phelps, on Flint creek and Canandaigua outlet; at Auburn, on Owasco outlet; almost the entire length of Skaneateles outlet (the fall being 453 ft. in 9 m.); at Cazenovia and Chittenango, on Chittenango creek; and at Fulton and Oswego, on Oswego river. The Alleghany, Susquehanna, and Delaware, with numerous branches, drain the western, central, and eastern portions respectively of the S. part of the state, and furnish valuable water power at numerous points. Cattaraugus and Tonawanda creeks are also considerable streams in the west, the former furnishing important water power, and the latter affording slack-water navigation for the Erie canal for about 10 m. from its mouth. The other principal streams are Buffalo river (formerly creek), flowing into Lake Erie; Oak Orchard creek, Genesee, Salmon, and Black rivers, flowing into Lake Ontario; Oswegatchie, Grasse, and Raquette rivers, tributaries of the St. Lawrence; Chazy, Saranac, and Au Sable rivers, and Wood creek, rapid streams or mountain torrents flowing into Lake Champlain, and furnishing almost unlimited water power; Susquehanna river, which rises in Otsego lake, and in its course in the state receives the waters of Charlotte, Unadilla, and Chenango rivers; and Chemung river, which drains a portion of the state between the Alleghany and Susquehanna, and receives the waters of Canisteo, Conhocton, and Tioga rivers. The principal branches of the Delaware are Popacton and

Nevisink rivers.—The state is noted for the great number of beautiful lakes in the interior and N. E. parts. The principal of these are Chautauqua and Cattaraugus, in the west; Hemlock, Honeoye, Canadice, and Conesus, in the Genesee basin, which discharge their waters into Genesee river; Canandaigua, Keuka, Seneca, Cayuga, Owasco, Skaneateles, Cross, Onondaga, Otisco, Cazenovia, and Oneida, in the central part of the state, all of which find an outlet for their waters through Oswego river; Otsego and Schuyler, which empty into the Susquehanna; and George, Schroon, Au Sable, Placid, Avalanche, Colden, Henderson, Sandford, Blue Mountain, the Fulton lakes (eight in number), Raquette, Beach's, Forked, Newcomb, Long, Cranberry, Upper Saranac, Lower Saranac, Tupper's, Chateaugay, Chazy, Rich, Pleasant, Peseco, Smith's, Moose, and numerous smaller lakes, in the N. E. part. Canandaigua, Keuka, Seneca, Cayuga, Owasco, Onondaga, Skaneateles, Chautauqua, Otsego, and Oneida lakes, and Lake George, are all navigable for boats and steamers, and on many of them considerable trade is carried on. Lakes Erie, Ontario, and Champlain are navigable for vessels of all sizes. Seneca lake never freezes, and steamers ply upon it throughout the year. The scenery of these lakes attracts thousands of pleasure seekers during the summer months.—The surface of the state is greatly diversified. The topographical features are clearly marked in the mountain ranges and great extent of certain outcrops forming escarpments which extend across the state E. and W. The range constituting the Highlands on the Hudson, entering the state from New Jersey, extends N. E. through Rockland, Orange, Putnam, and Dutchess cos. It is composed of compact gneissoid and granitic rocks. The highest points, varying from 1,100 to 1,700 ft., are Butter hill, Crow's Nest, and Bear mountain in Orange co.; Bull hill, Anthony's Nose, and Breakneck mountain in Putnam co.; and Beacon hill in Dutchess co. This range in its proper limitation gradually declines northeastward to Dover Plains, and passes in low hills into Litchfield co., Conn. It has been sometimes regarded as a continuation of the Blue Ridge of Virginia, but the connection is not proved, and its geological relation is distinct from the metamorphic formations on either side. The Adirondack range is of the same age as the Highlands, and of the same geological structure. This range begins in the Mohawk valley, and is seen on both sides of it at the Noses, rising on the south 100 ft. above the level of the river, and again at Little Falls, forming the rapids. It extends over the N. part of Montgomery and Herkimer cos., the N. E. part of Oneida, all of Lewis co. E. of the Black river, a considerable part of Saratoga, the most of Warren, Hamilton co. entire, nearly all of Essex, Clinton, and Franklin, the greater part of St. Lawrence, and much of Jefferson. The whole constitutes "that

comparatively immense and beautifully circumscribed nucleus, which from a height [in Essex co.] of nearly 6,000 ft. descends with great irregularity, and disappears under the transition rocks which encircle it, and which border the St. Lawrence, the Champlain, the Mohawk, and the Black river." Under the patronage of the state, Mr. Verplanck Colvin has been for several years engaged in a topographical and trigonometrical survey of some portions of this region, and his reports for 1873 and 1874 present many new facts. The position and altitude of many mountains and lakes have been determined by him, and the heights of well known peaks more accurately measured, giving to Mt. Marcy and Mt. McIntyre 5,402 and 5,201 ft. respectively. Gothic mountain and Basin mountain, nearly 5,000 ft. in height, are among those now for the first time determined. Mts. Dix, Seward, and Santanoni are reduced by Mr. Colvin's measurements to 4,916, 4,384, and 4,644 ft. respectively. He reports the existence in this region of the moose and beaver, though rare and nearly extinct. The bear, panther, and wolf are still common, and are trapped for their fur or for state bounty. The common deer are plentiful in some sections. A commission of state parks appointed by the legislature have reported in favor of setting apart as a state park from 600 to 3,000 sq. m. of the high mountain region of the Adirondacks, embracing Mt. Marcy and all the great peaks; the chief objects being to preserve the forests for their beneficial climatic effects, moderating the spring freshets in the Hudson by sheltering the snow from the heat of the sun, shielding the sources of this river from evaporation, and affording a healthful pleasure ground. The continuation of the Appalachian range proper in New York is seen in the Shawangunk and Catskill mountains; the former a continuation of the Kittatinny and Blue mountains of Pennsylvania, the latter of the Alleghany, Broad Top, Laurel Hill, and others. This range, entering the state from the southwest, extends northeasterly through Sullivan, Ulster, Delaware, and Greene cos., culminating in the Catskills about 8 m. from the Hudson river. Several minor ridges pass through the W. part of Delaware, Broome, Otsego, and Chenango cos., extending into the S. part of Schoharie, and forming a part of the Catskill mountain range. Along the eastern boundary of the state is a less defined but continuous low mountain range belonging to the same system, entering the state from New Jersey W. of the Highlands, there forming Skunemunk mountain, and extending thence through Dutchess, Columbia, Rensselaer, and Washington cos., known as the Taghkanic range. It is usually regarded as subordinate to the Green mountain range. Its highest points are Beacon hill and Mt. Washington in Dutchess co. The Helderberg mountains are a northern extension of the formations constituting the base of the Catskill mountains. These present a steep escarpment

on the north and northeast, over the Helderberg limestones and Hudson river formation, while the higher rounded summits are of the Hamilton group. This escarpment continues more or less distinctly to the Niagara river. Spurs of the Alleghanies occupy the S. part of the western half of the state. The watershed separating the northern and southern drainage of western New York extends in an irregular line through the southerly counties. That portion of the state S. of this watershed, and embracing the greater part of the two southerly tiers of counties, is almost entirely hilly. The highest summits W. of the Susquehanna are in Allegany and Cattaraugus cos., and are 2,000 to 2,500 ft. above tide. N. of the watershed the face of the country descends in a series of rolling and smooth terraces toward Lake Ontario, the region between the hills of the south and the level lands of the north being a beautiful rolling country. S. of the Highlands the surface is generally level or broken by low hills. The river system consists of two general divisions, viz.: that part drained by the great lakes and the St. Lawrence, northerly; and that part drained by the Hudson and other rivers, southerly. The watershed between these two divisions extends in an irregular line from Lake Erie eastward through the southern tier of counties to near the N. E. corner of Chemung co., thence N. E. to the Adirondack mountains in Essex co., thence S. E. to the E. extremity of Lake George, and thence nearly due E. to the E. line of the state. The northern of these divisions consists of five subdivisions or basins, viz.: the basin drained by Lake Erie, Niagara river, and Lake Ontario W. of Genesee river; that of Genesee river and its tributaries; of Oswego river and its tributaries, and the small streams flowing into Lake Ontario between Genesee and Oswego rivers; of the St. Lawrence and the streams flowing into Lake Ontario E. of Oswego river; and that drained by Lakes George and Champlain. The southern division consists of four subdivisions, viz.: the Alleghany, the Susquehanna, the Delaware, and the Hudson river basins.—The geological series within the state of New York is very complete, from the oldest palæozoic rocks to the lower members of the carboniferous system inclusive. This series was described by the New York geologists as the New York system. The Adirondack region, N. of the Mohawk and E. of the Black river, comprises the most ancient highly crystalline rocks, known as the Laurentian system; the lower portions are gneissoid and granitic, and the higher consist of labradorite and hypersthene, forming a coarse granitic mass. Extensive beds of magnetite traverse the strata parallel to the bedding, yielding immense quantities of the ore. The hypersthene rock forms the great mountain centre of which Mts. Marcy and McIntyre are the culminations. In St. Lawrence and Jefferson cos. the prevailing rocks are coarse granite, crystalline limestone, and serpentine,

containing vast beds of specular iron ore. These rocks are doubtfully of Laurentian age, but their relations to other formations have not been determined. The crystalline rocks of this entire area are regularly stratified, and were formed anterior to the Potsdam sandstone, which lies against and upon their upturned and eroded edges. The Highlands on the Hudson are of the same age as the Adirondacks, and also contain heavy beds of magnetite. The gneissoid and mica slate formation, which comes into the state from the south and passes eastward of the Highlands, is of more recent age, and contains no magnetite. In New York the Potsdam sandstone succeeds the Laurentian, and appears in a broad, continuous belt along the N. and N. W. slopes of the Adirondacks, and in interrupted outliers on the east, from Clinton to Saratoga co. Overlying the Potsdam, the calciferous sandstone is coextensive with it in the north, and extends further S. The Taghkanic range, including shales, sandstones, and limestones, often more or less metamorphic, with beds of hematite, white and variegated marbles, roofing slate, &c., must be considered of the same age as the Potsdam and calciferous sandstones and Chazy limestone of Lake Champlain. The Trenton group, including Birdseye, Black river, and Trenton limestones, occupies much of Jefferson co., and, continuing S. E. through Lewis and Oneida cos., is seen at Trenton falls and in the Mohawk valley; thence eastward and northward it encircles at least two thirds of the great Laurentian district. The Utica slate and Hudson river group, extending from near Rondout, form a belt on both sides of the Hudson to the bend at Sandy Hill; following the course of the Mohawk valley as far as Rome, it diverges N. W. through Lewis and Oswego cos. to Lake Ontario. The Shawangunk grit or conglomerate, containing lead and copper ores, extends from the Delaware river to Rondout, where it suddenly terminates, and is not again seen *in situ*, except in Oneida co., where it is known as the Oneida conglomerate. The gray sandstone of Oswego holds essentially the same position, and boulders and pebbles of similar conglomerate have been there found upon the surface. Southward from the outcrop of the Hudson river group, the Medina sandstone and Clinton group come in; the thin edge of the latter, beginning in Schoharie co., trends westward, and extends on both sides of Oneida lake, and thence with the sandstone forms a broad belt along the S. shore of Lake Ontario. The beds of fossiliferous iron ore of the Clinton group are extensively worked in Oneida and Wayne cos., and extend as far W. as Monroe. The limestone of the Niagara group produces the falls of the Niagara and the great escarpment of Lewiston and Queenston, which, beginning as a terrace in Schoharie co., extends through the state and western Canada. Co-extensive with this formation are the water-lime and salt groups; of small force in eastern

New York, they expand in the central part of the state. The salt group is the source of all the productive brine springs and wells, and also of the gypsum. The waterlime group furnishes nearly all the hydraulic cement. Entering the state from the N. W. corner of New Jersey, and occupying the valley W. of the Shawangunk mountain, a series of strata of no great prominence reach the Hudson at Rondout, trend northward in a low terrace everywhere marked by a limestone crest, and extend into Albany co. Here thickening and expanding, they constitute the Helderberg formations, separated into upper and lower by the Oriskany sandstone; these, surmounted by the Hamilton rocks, form the Helderberg mountains. The Hamilton group enters the state from the south at Deer Park, approaches the Hudson at Kingston, and thence following the base of the Catskills turns westward, expanding to a width of several miles, and becoming a highly fossiliferous group. The higher beds furnish the flagstones which are extensively quarried and supplied to all the seaboard cities and towns of the north. The thicker beds are known as the Hudson river blue stone. The Portage and Chemung groups, the former marked by dark shales and flaggy sandstones, the latter by olive shales and heavy-bedded sandstones, form a broad belt, entering the state from Pennsylvania on the Delaware river; thence, skirting the base and forming a considerable portion of the lower part of the Catskill mountains, they sweep around them to the north and occupy the valleys between them. From the Chenango river west these formations cover almost the entire width of the two southern ranges of counties, and outcrop on Lake Erie from Eighteen-mile creek to the Pennsylvania line. The Catskill or old red sandstone formation enters the state on the south in several belts, trending N. E. The more westerly of these soon die out, but the three easterly ones continue into Greene co., and uniting form the Catskill mountains. These belts, which are synclinals, carry also outliers of the succeeding formation, the lowest sandstones of the carboniferous system, forming considerable areas on the higher summits of the Catskills and further south. Beyond these lower carboniferous beds the geological series in direct succession is not continued within the state of New York. The red sandstone of the middle secondary, or trias, extends from N. E. New Jersey over a part of Rockland co., terminating at the Palisades on the Hudson and at Haverstraw bay. The cretaceous formation is known on Long Island. The more recent formations are the post-pliocene of the Champlain valley, and the glacial or water-worn drift which to a great extent overspreads the older formations. The mineral springs of Saratoga and Ballston rise from a line of fault which brings the Hudson river slates against the calciferous sandstone and limestones above. The sulphur springs of Sharon, &c., rise from the upper part of the

Onondaga salt group. In western New York the sandstones are bituminous, and in several of the counties petroleum issues with the water of springs; and carburetted hydrogen rises from fissures in the rocks, or through standing or running water. The rock formations from the Potsdam sandstone up, which have been named, with their various subdivisions, constitute what is called the New York system, and with the carboniferous group complete the Appalachian system. Though the whole series is found in Pennsylvania, the formations below the carboniferous are more fully developed in New York, and are especially richer in fossils. In this state therefore they have been studied to the best advantage, and when recognized in other parts of the country are generally known by the names given to them by the New York geologists. (See GEOLOGY, and PALEONTOLOGY.) Many of the groups are in great part made up of limestones, and even among the shales and slates of the others calcareous strata are of frequent occurrence. The effect of this wide distribution of calcareous matter has been to insure a general fertility of soil, and to give to New York a high position among the agricultural states of the Union.—Somewhat more than half of the total area of the state is under cultivation. In the northern counties and the highland regions along the S. border and on the Hudson, stock and sheep raising and dairy farming are the almost exclusive agricultural pursuits; while the low lands that form the greater part of the surface of the W. portion of the state are best adapted to grain growing. Broom corn has long been the staple crop of the Mohawk valley intervals; tobacco is extensively raised in the Chemung valley, and parts of Onondaga and Wayne cos.; hops are a leading product of Madison, Oneida, Otsego, and Schoharie cos.; grapes are successfully cultivated in the valley of the Hudson below the Highlands, on the N. shore of Long island, and in all the lake valleys in the central part of the state. Maple sugar is an important product of the northern and central portions; and fruits, particularly apples, peaches, pears, and strawberries, are grown in the western counties N. of the watershed. Large tracts in the vicinity of New York city are devoted to market gardens and to furnishing the city with milk.—The climate possesses a wider range than that of any other state in the Union. Those portions affected by the winds from the ocean, sound, and lakes are more even in temperature and suffer less severely from late and early frosts than more inland districts in the same latitude. The mean temperature of the state, as determined from observations made at 58 meteorological stations, for periods ranging from 1 to 25 years, is 46.49°. The mean length of the season of vegetation, from the first blooming of apples to the first killing frost, is 174 days; while on Long island it is 12½ days longer, and in St. Lawrence co. 22 days shorter. The

mean annual fall of rain and snow is about 40.93 inches.—The most noted waterfalls in the state are Niagara falls in Niagara river, 2,900 ft. wide and 164 ft. high; the falls of Genesee river (see GENESSEE RIVER); Trenton falls, in West Canada creek, Herkimer co., consisting of five cascades with a total fall of 200 ft. in ¾ m.; Taghanic falls, Tompkins co., 230 ft.; Chittenango falls in Chittenango creek, Madison co., 136 ft.; Lyon's falls, in Black river, Lewis co., flowing down an inclined plane 63 ft. at an angle of 60°; Kaaterskill falls, Greene co., consisting of two falls, 180 and 80 ft.; Bash-bish falls, Columbia co. (partly in Massachusetts), a succession of falls in a deep ravine, the total fall in 1 m. being about 700 ft.; Baker's falls, Washington co., a succession of falls and rapids, having a total descent of 76 ft. in 60 rods; Cohoes fall in the Mohawk, near its mouth, with a total fall including rapids of 103 ft.; Glen's falls, Warren co., 50 ft.; High falls, in the Hudson, Warren co., 60 ft.; High falls, Ulster co., 50 ft.; the Au Sable falls, in Wilmington, Essex co., 100 ft.; Enfield falls, Tompkins co., consisting of a series of cascades with a total fall of 230 ft.; Buttermilk falls, Genesee co., 90 ft.; and the falls in Fall creek, Tompkins co., consisting of five cascades with a total descent of over 500 ft. in 1 m. Watkins glen, near the head of Seneca lake, is a deep and narrow ravine about 3 m. long, having perpendicular walls in some places 200 ft. high. Its annual visitors number more than 50,000. Havana glen, 3½ m. distant, is similar to it. Within a radius of 10 m. from Ithaca are numerous picturesque ravines and waterfalls. Upon Stone Bridge creek, Warren co., is a natural bridge 40 ft. high, 80 ft. broad, and 247 ft. long. The principal mineral and medicinal springs are the salt springs of Onondaga co.; Saratoga Springs; New Lebanon and Stockport, Columbia co.; Massena, St. Lawrence co.; Richfield, Otsego co.; Avon, Livingston co.; Clifton, Ontario co.; Sharon, Schoharie co.; Chittenango, Madison co.; and Alabama, Genesee co. The "Lake ridge," the shore line of the ancient lake, is a beach-like ridge from 4 to 8 m. S. of Lake Ontario and rising from 5 to 20 ft. above the general surface, extending from near the Niagara river to Sodus, Wayne co.; thence with many interruptions its line may be traced to the St. Lawrence near its point of egress from the lake.—In many respects New York is the leading agricultural state of the Union. According to the census of 1870, the area of farm lands was greater than in any other state except Illinois; they were valued at upward of \$118,000,000 more than those of any other state, and yielded during the year nearly \$43,000,000 more. In several of the western and southern states the yield of wheat and Indian corn was greater, but New York produced more than a fifth of all the hay raised in the United States, more than a third of the buckwheat, and 17,558,681 lbs. of the entire growth (25,456,669 lbs.) of

hops. The state ranked first in the production of peas, beans, and potatoes, as well as in the value of the produce of market gardens, orchards, and forests; next to Ohio in flax, Pennsylvania in rye, California in barley, Vermont in maple sugar, Illinois and Pennsylvania in oats, and Ohio and California in the amount of wool and the number of sheep. In dairy products the prominence of New York is specially marked. In 1870 there were on farms 8,935,332 milch cows in the United States, of which 1,350,661 were in New York. The dairy products of the whole country were 514,092,683 lbs. of butter, 53,492,153 of cheese, and 235,500,599 gallons of milk sold; of New York, 107,147,526 lbs. of butter, 22,769,964 of cheese, and 135,775,919 gallons of milk sold. The factories of the United States produced 109,435,229 lbs. of cheese, valued with other products at \$16,771,665, of which 78,006,048 lbs., valued at \$12,164,065, were the product of New York. The great dairy counties of the state are St. Lawrence, Delaware, Chenango, Chautauqua, Jefferson, and Orange. In 1870 there were on farms 15,627,206 acres of improved land, 5,679,870 of woodland, and 883,734 of other unimproved land. The number of farms was 216,253, averaging 103 acres; 13,006 contained from 3 to 10 acres each, 18,145 from 10 to 20, 54,881 from 20 to 50, 73,956 from 50 to 100, 55,948 from 100 to 500, 209 from 500 to 1,000, and 36 over 1,000. The cash value of farms was \$1,272,857,776; farming implements and machinery, \$45,997,712; total amount of wages paid during the year, including value of board, \$34,451,362. The agricultural productions of New York in 1873, and the number and value of live stock on farms Jan. 1, 1874, as reported by the U. S. department of agriculture, were as follows:

PRODUCTIONS AND LIVE STOCK.	Quantity and number.	Average yield per acre.	Number of acres in crop.	Total valuation.
Indian corn, bushels	17,692,000	81	570,710	\$12,384,400
Wheat..... "	7,047,000	13.5	522,000	11,275,200
Rye..... "	1,858,000	14	182,857	1,598,580
Oats..... "	27,548,000	81	888,645	11,345,640
Barley..... "	5,576,000	21.2	277,170	6,468,600
Buckwheat. "	2,947,000	19.7	149,594	2,269,190
Potatoes ... "	24,925,000	103	241,990	18,459,500

Sheep..... "	2,037,200	6,544,992
Hogs..... "	651,500	5,036,095

In 1870 the total estimated value of all farm productions, including betterments and additions to stock, was \$253,526,153; products of orchards, \$8,347,417; of market gardens, \$3,432,354; of forests, \$6,689,179; of home manufactures, \$1,621,621; of animals slaughtered or sold for slaughter, \$28,225,720. The productions were 1,834,330 bushels of spring and 10,344,132 of winter wheat, 2,478,125 of rye, 16,462,825 of

Indian corn, 35,293,625 of oats, 7,434,621 of barley, 3,904,030 of buckwheat, 1,152,541 of peas and beans, 28,547,593 of Irish and 10,656 of sweet potatoes, 98,837 of clover and 57,225 of grass seed, 92,519 of flax seed, 5,614,205 tons of hay, 2,349,793 lbs. of tobacco, 10,599,225 of wool, 3,670,818 of flax, 6,692,040 of maple sugar, 896,286 of honey, 86,333 of wax, 82,607 gallons of wine, and 7,832 of sorghum and 46,048 of maple molasses. There were on farms 536,861 horses, 4,407 mules and asses, 1,350,661 milch cows, 64,141 working oxen, 630,522 other cattle, 2,181,578 sheep, and 518,251 swine. The value of live stock was \$175,882,712. There were 319,380 horses and 40,906 neat cattle not on farms.—According to the census of 1870, more than a sixth of all the capital invested in manufactures in the United States was employed in New York, and more than a sixth of the value of the entire products of the country was the result of New York industry. In the state ranking next, Pennsylvania, nearly \$40,000,000 more capital was invested than in New York, but the products of the latter state were valued at upward of \$72,000,000 more than those of the former. The capital has increased from \$99,904,405 in 1850 to \$172,895,652 in 1860 and \$366,994,320 in 1870; and the total value of products from \$237,597,249 in 1850 to \$378,870,939 in 1860 and \$785,194,651 in 1870. In the last named year, the total number of establishments was 36,206, using 4,664 steam engines of 126,107 horse power, and 9,011 water wheels of 208,256 horse power, and employing 351,800 hands, of whom 267,378 were males above 16, 63,795 females above 15, and 20,627 youth. The materials used amounted to \$452,065,452; wages paid, \$142,466,758. Not included in the above results for 1870 are the statistics of mining and quarrying, in which industries 5,177 hands were employed, \$4,696,091 capital invested, and \$4,324,651 worth of products obtained, including 525,493 tons of iron ore valued at \$2,095,315, and \$1,832,976 worth of stone; and those of fisheries, in which the products amounted to \$235,750. The most extensive iron mines are in Essex, Dutchess, Clinton, and Orange cos. The greater portion of the stone was quarried in Ulster co., though a large amount of marble was produced in Westchester co. In the following table of the leading industries a comparison is afforded between the values in New York and in the United States of those products in which the former ranks above all other states. In several other important industries, New York holds a very high but not the first rank. Thus, taking the value of products as a standard, the state ranks next to Massachusetts in the production of boots and shoes and paper, to Connecticut in hardware, to Illinois in planed lumber, to Ohio in agricultural implements, and to Pennsylvania in brick, carpets other than rag, drugs and chemicals, iron manufactures, and machinery.

INDUSTRIES.	No. of establish- ments.	No. of hands employed.	Capital.	Wages.	Value of materials.	Value of products.	Products of the United States.

In Onondaga co. are the most extensive salt works in the United States. They are owned	and managed by the state, which derived from this source in 1873 a net revenue of \$15,180.
--	---

The works in operation have an annual productive capacity of 10,700,000 bushels; 7,450,-257 bushels were inspected in 1873, and 6,594,-191 in 1874. (See SALT.)—For commercial purposes the state is divided into the following ten United States customs districts, of which the ports of entry bear the same name unless otherwise specified: Buffalo Creek, Cape Vincent, Champlain (port of entry Plattsburgh), Dunkirk, Genesee (Rochester), New York, Niagara (Suspension Bridge), Oswegatchie (Ogdensburg), Oswego, and Sag Harbor. In the district of New York, Albany, Esopus, Hudson, Kinderhook, Newburgh, New Windsor, Port Jefferson, Poughkeepsie, Rhinebeck Landing, and Troy are ports of delivery. The imports and exports for the year ending June 30, 1874, were as follows:

DISTRICTS.	Imports.	Domestic exports.	Foreign exports.
Buffalo Creek.....	\$2,916,406	\$460,473	\$53,949
Cape Vincent.....	524,480	118,110
Champlain.....	2,176,784	1,041,154	34,957
Dunkirk.....	8,623
Genesee.....	429,472	367,527	38
New York.....	395,133,622	340,360,269	14,633,463
Niagara.....	4,579,846	351,078	65,731
Oswegatchie.....	1,977,751	605,233	136,264
Oswego.....	7,200,952	1,724,651	187
Sag Harbor.....

The movement of foreign shipping in the various districts, and the number of vessels registered, enrolled, and licensed, were as follows:

DISTRICTS.	ENTERED.		CLEARED.		REGIST'D, & C.	
	Vessels.	Tons.	Vessels.	Tons.	Vessels.	Tons.
Buffalo Crk	730	241,456	704	224,130	805	163,829-08

Sag Harbor.....	24	5,334	25	5,452	7	385

Details of the commerce of the port of New York are given in the article on that city. The only district in which vessels were reported to be engaged in the fisheries was that of Sag

Harbor, where in 1873 128 were employed in the cod and mackerel fisheries and 1 in the whale fishery; 7 vessels entered and 9 cleared in the general fisheries. Within the past few years the state commissioners of fisheries have taken measures to stock the internal waters of the state with varieties of edible fish. A state hatching house is maintained at Caledonia, Livingston co., and there is an extensive shad nursery in the Hudson, about 10 m. below Albany.—The first railroad in New York, the Mohawk and Hudson (from Albany to Schenectady), 17 m. long, was opened in 1831. In the following year the Saratoga and Schenectady, 21 m., and one mile of the New York and Harlem, were opened. The mileage of the state had increased to 719 m. in 1845, 2,444 in 1855, 2,769 in 1865, 3,829 in 1870, 4,927 in 1873, and 5,178 in 1874. There are stringent laws concerning the formation and continuance of railroad corporations, and strict regulations as to the protection of passengers. Each corporation is required to make an annual report under oath to the state engineer and surveyor, giving details as to the condition and transactions of the company; and this officer reports annually to the legislature. The chief items relating to all the corporations in the state in 1874 are shown in the following statement, in which the figures, except the mileage specified for New York, are not limited to the state, but apply to the entire corporations:

Miles of entire main line and branches.....	8,552
" of double track and sidings.....	8,956
Total track mileage.....	12,508
Miles main line and branches exclusive of second tracks and sidings completed in New York.....	5,178
Capital stock authorized.....	\$611,298,570
" paid in.....	\$202,365,070
Funded debt.....	\$201,681,017
Floating ".....	\$30,801,657
Total stock and debt.....	\$232,847,735
Cost of construction and equipment.....	\$598,543,330
Total annual expenses.....	\$66,087,974
Total annual earnings.....	\$97,951,073
Net annual earnings.....	\$31,868,099

The two most extensive railroad corporations of the state are the Erie and the New York Central and Hudson River. The former, chartered in 1832, was opened from Piermont to Goshen in 1841, to Binghamton in 1848, to Elmira in 1849, to Corning in 1850, and to Dunkirk in 1851. The eastern terminus was subsequently extended to Jersey City. More than 1,000 m. of railroad are operated by this company, whose earnings in 1873 exceeded \$20,000,000. The New York Central and Hudson River railroad is a consolidation of numerous lines. It was completed from Albany to Buffalo in 1841, and from New York to Albany in 1851. About 860 m. of road are owned and leased by the company; the total earnings in 1873 were about \$29,000,000. The following table exhibits the names of the lines lying wholly or partly within the state, together with the termini, the number of miles in operation within the state Jan. 1, 1875, and the paid-in capital stock and cost of construction and equipment for the entire lines:

NAMES OF CORPORATIONS.	TERMINI.		Miles completed in the state in 1874.	Total length between terminus when different from preceding.	Capital stock paid in.	Cost of construction and equipment.

The canals of New York are a highly important feature in its commercial facilities. (See CANAL, vol. iii., p. 685.) The Erie canal, connecting Lake Erie with the Hudson river, affords a continuous water channel through which the produce of the western states and Canada may reach the port of New York; while the several canals traversing the state from north to south supply transportation facilities to the interior of New York and Pennsylvania. The canals and navigable feeders owned by the state aggregate 857 m. in length, and the river and other improvements exclusive of lakes which have been completed increase the length of the artificial system of navigable waters to 907 m. The general su-

perintendence of the canals is vested in three commissioners elected for three years, who have charge of the construction of new and the repairs of old canals. The state engineer and surveyor inspects the canals and performs other duties, while the canal board, composed of the lieutenant governor, comptroller, secretary of state, treasurer, attorney general, state engineer and surveyor, and the canal commissioners, fix the rates of toll with the concurrence of the legislature, appoint officers, &c. The amount of freight transported on all the state canals during 1874 was 5,804,588 tons, valued at \$196,674,322, including products of the forest valued at \$17,840,356; agricultural products, \$64,344,898; manufactures, \$7,094,531;

merchandise, \$64,477,540; and other articles, \$42,916,997. The total quantity of freight carried by the canals was nearly half as great as that transported by the Erie and New York Central railroads. The amount of freight brought to the Hudson river by the Erie and Champlain canals was 3,223,112 tons, valued at \$107,976,476; 1,709,816 tons of freight, worth \$71,294,867, were brought by canal boats directly to New York. The number of boats arrived at and cleared from New York, Albany, and Troy was 30,806. Until 1874 the legislature was prohibited by the constitution from

selling or leasing any of the state canals; but in that year an amendment was adopted removing the restriction except in the case of the Erie, Oswego, Champlain, and Cayuga and Seneca canals. Besides the state canals there are belonging to corporations the Delaware and Hudson canal, extending from Honesdale, Pa., to Eddyville near Rondout, 108 m., of which 83 are in New York, and affording communication between the Delaware and Hudson rivers; and the Junction canal, which extends from Elmira to the Pennsylvania state line, 18 m. The details of the state canals are as follows:

NAME OF CANAL.	TERMINI.		Length in miles.	Total cost of construction to Sept. 30, 1872.	Financial result of operating (including ordinary repairs) from 1846 to 1872.		Income from tolls and total expense for three years ending Sept. 30, 1874.

The above statement shows that the profits of operating the canals from 1846 to 1872 exceeded \$60,000,000, after crediting each canal with the tolls properly belonging to it and deducting the cost of collection, superintendence, and ordinary repairs, but not the taxes levied for enlargement, extraordinary repairs, payment of damages, &c., amounting to about \$25,000,000 which is placed with the construction and enlargement account. The total tolls and miscellaneous receipts of all the canals from 1836 to the close of 1874 amounted to \$115,318,504, and the expenses of collection and repairs to \$38,791,685, leaving a surplus revenue for that period of \$76,526,819. In 1874 the tolls amounted to \$2,921,721, and the disbursements to \$2,696,357, including \$1,297,716 for ordinary repairs and \$1,398,640 for extraordinary repairs and new work. The total canal revenue from all sources other than taxation was \$2,947,972.—For 30 years following 1818 the laws of New York restricted the banking business to companies or institutions chartered by special law. This was followed by the "free banking" system, which was based on the deposit of securities with redemption at a fixed rate of discount.

* Included in Erie. † Including Champlain.

State and savings banks are required to report to the superintendent of the banking department, the former quarterly and the latter semi-annually. Three examiners are constantly passing through the state inspecting banks. The superintendent reports annually to the legislature. In October, 1874, 81 banks were doing business under the laws of the state. The amount of circulation outstanding, including that of the 41 incorporated banks and of banking associations and individual bankers, was \$1,105,189, of which \$367,438 was secured. The number of national banks on Nov. 1, 1874, was 276, with a paid-in capital of \$108,339,691; bonds on deposit, \$64,963,050; outstanding circulation, \$59,299,049. The circulation *per capita* was \$13 53; ratio of circulation to the wealth of the state, 9 per cent.; to bank capital, 54·7. The total number of savings banks on Jan. 1, 1874, was 155, with 822,642 depositors and deposits aggregating \$285,520,085; average to each depositor, \$340 12; resources, \$307,589,730; liabilities, \$285,140,778; surplus assets, \$21,448,952. Insurance companies are subject to rigid inspection by the superintendent of the insurance department, who reports annually to the legislature. At the beginning of 1875 the insurance corporations of New York held more than

\$500,000,000 assets, while their risks exceeded \$8,000,000,000. The assets of the fire and marine and of the marine companies doing business in the state were returned at \$160,133,455, and of life and casualty companies at \$327,281,896; the amount insured by the former was \$6,313,967,008, and by the latter \$1,997,236,230. There were 218 fire and marine and 50 life and casualty insurance companies doing business in the state; 119 of the former and 23 of the latter were New York companies.—The constitution of New York gives the right of suffrage to every male citizen of the age of 21 years who shall have been a citizen 10 days and an inhabitant of the state one year next preceding the election, a resident of the county four months, and of the election district 30 days. The general state election is held annually on the first Tuesday after the first Monday in November. The legislature consists of a senate of 32 members elected for two years, and an assembly of 128 members chosen for one year. An apportionment of assembly and senate districts is made decennially immediately after the state census, the latest being in 1865. Under the constitutional amendments of 1874 each member of the legislature receives \$1,500 a year (previously \$3 a day for a session limited to 100 days) and 10 cents a mile for travel once to and from the capital. No one is eligible as a member who at the time of his election, or within 100 days next preceding it, was a member of congress, a civil or military officer under the United States, or an officer under any city government. The legislature meets annually on the first Tuesday in January. Special legislation is restricted by the constitution. The governor (annual salary, \$10,000 and residence) and lieutenant governor (\$5,000) are to be elected from 1876 for three years (the term having been previously, since 1821, two years). The secretary of state, comptroller, treasurer, attorney general, and state engineer and surveyor are chosen (in even years) for two years. The treasurer may be suspended from office by the governor during the recess of the legislature. Members of the legislature and all elected officers, executive and judicial, except specified inferior officers, are required before entering upon their official duties to make oath or affirmation that they have not been guilty of bribery at the election at which they were chosen. A majority of the assembly may impeach. The court of impeachment is composed of the senate and the judges of the court of appeals. The highest judicial tribunal of the state is the court of appeals, which has only appellate jurisdiction in the case of judgments and certain orders from the general term of the supreme court, the superior courts of the cities of New York and Buffalo, the New York court of common pleas, and the city court of Brooklyn. It consists of a chief (salary \$7,500 and \$2,000 expenses) and six associate judges (\$7,000 each and \$2,000 expenses), and is in session in Al-

bany the greater portion of the year. The commission of appeals, composed of five judges, was organized under a constitutional amendment of 1869 for the hearing of cases that had accumulated in the court of appeals; the former is subsidiary to the latter, and temporary. There are 33 justices of the supreme court, four in each of the eight judicial districts, except the first, comprising the city and county of New York, in which the number is five. The supreme court has general original jurisdiction. Special terms and circuits are held by one justice, the former without and the latter with a jury. General terms are held in each of the four departments into which the state is divided for this purpose, by a presiding and two associate justices designated by the governor, the concurrence of two being necessary to a decision. Its jurisdiction is appellate, appeals being made from the special term and circuits, from judgments entered by the court on referees' reports, from judgments of county courts and mayors' and recorders' courts, and from certain orders. A county court is held in each county, except that of New York. In some counties the people elect a surrogate, who has jurisdiction of probate matters; where such special courts have not been provided, the county judge performs surrogate duties. Criminal jurisdiction is exercised by courts of oyer and terminer, composed, except in the city of New York, of a justice of the supreme court, a county judge, and two justices of the peace; courts of sessions, comprising a county judge and two justices of the peace; courts of special sessions; and police courts held by a single justice. Besides the above there are mayors' and recorders' courts of cities and justices' courts, a city court in Brooklyn, and a superior court in Buffalo. The several courts peculiar to the city and county of New York are described in the article on that city. The judges of the various courts are elected by the people, those of the court of appeals and supreme court for fourteen, of county courts for six, and justices of the peace for four years. Sheriffs, county clerks, coroners, and district attorneys are chosen by the people. There are three districts, northern, eastern, and southern, for holding United States courts; sessions are held in New York city for the southern, in Brooklyn for the eastern, and in Albany, Utica, Canandaigua, Rochester, and Buffalo for the northern district. The organized state militia, called the national guard, comprises 23,360 men, classified into 8 divisions and 20 brigades, viz.: 1 regiment, 1 battalion, and 9 troops of cavalry, 12 batteries of artillery, and 31 regiments, 12 battalions, and 3 detached companies of infantry. The state exercises a strict supervision over corporations, especially those which are fiduciary or involve extensive financial interests. Corporations, except municipal, must be formed under general laws. Railroad, banking, and insurance corporations are subject to the inspection of special departments, to which

sworn reports must be made, and by which reports are annually made to the legislature and published. A married woman may hold to her separate use real and personal property, if acquired from any other person than her husband, and may convey and devise it; she may also carry on business on her own account, and sue and be sued. Neither license, magistrate, nor minister is necessary to a valid marriage contract; it has even been held that the agreement of the parties constitutes legal marriage. The sole ground of divorce occurring after marriage is adultery; at the time of marriage, impotence, idiocy, or lunacy, and consent obtained by force or fraud. The legal rate of interest is 7 per cent.; usurious contracts are void; taking of usury is a misdemeanor; and corporations cannot interpose the defence of usury. New York is represented in congress by two senators and 33 representatives, and has

therefore 35 votes in the electoral college.—The state debt, with the unapplied balances of the sinking funds, Sept. 30, 1874, was as follows:

CHARACTER OF DEBT.	Debt.	Balance of sinking funds.	Balance of debt after applying sinking funds.
General fund.....	\$3,988,526	\$4,142,694
Contingent.....	68,000	82,828	\$85,176
Canal.....	10,230,430	1,561,019	8,669,411
Bounty.....	15,912,500	7,125,288	8,787,222
Total.....	\$80,199,456	\$12,861,814	\$17,491,509

The only contingent debt of the state is \$68,000 incurred for the Long Island railroad, the interest of which is paid and the payment of the principal provided for by that company. The condition of the several trust funds on Sept. 30, 1874, is shown in the following statement:

FUNDS.	Capital Sept. 30, 1874.	REVENUE AND EXPENDITURE.		
		Receipts during the year, includ- ing balances Oct. 1, 1873.	Payments during the year.	Balance Sept. 30, 1874.
School fund.....	\$3,054,772 10	\$392,372 45	\$301,908 96	\$468 49
Literature fund.....	271,980 76	50,157 13	45,894 20	4,322 93
United States deposit fund.....	4,014,520 71	276,310 96	238,862 24	37,448 72
College land scrip fund.....	473,402 87	24,284 54	22,342 47	1,942 07
Cornell endowment fund.....	128,596 61	12,508 91	11,135 00	1,373 91
Elmira female college educational fund.....	50,000 00	8,500 00	8,500 00
Long Island railroad company sinking fund.....	82,823 49	17,786 30	14,250 63	3,555 67
Trust fund for payment of bounties.....	20,830 00

The total receipts into the treasury on account of all the funds except the canal and the free school funds (the latter arising from the state tax), for the year ending Sept. 30, 1874, were \$26,465,370, and the payments \$19,636,308. Among the ordinary public expenditures were: executive department, \$31,255; legislative, \$289,991; judiciary, \$400,578; public offices, salaries, clerk hire, and expenses, \$301,734; printing for the state, \$181,131; military, \$356,159; educational, including common, normal, and Indian schools, academies, &c., \$3,278,858; state prisons, including transportation of convicts, \$967,930; support of deaf and dumb, blind, insane, and idiotic, \$338,852; quarantine, \$215,483. The statute requires real and personal estate to be assessed for taxation "at the full and true value thereof," but it is

maintained by high authority that not more than one third in value of the property liable to taxation is placed upon the assessment rolls. The aggregate taxation of 1874 included state tax \$13,015,847, school \$2,711,634, county \$32,119,578, and town \$9,964,321. The rate of the state tax was $7\frac{1}{4}$ mills, viz.: schools, $1\frac{1}{4}$; general purposes, $1\frac{1}{2}$; general purposes (deficiency), $\frac{6}{10}$; bounty debt, 2; new capitol, $\frac{1}{2}$; asylums and reformatories, $\frac{1}{16}$; canal floating debt, $\frac{1}{10}$; new work on canals and extra repairs, $\frac{1}{8}$; for payment of awards by canal appraisers and commissioners, and certain certificates of indebtedness, $\frac{1}{32}$. The total amount produced by this rate (state and school taxes) was \$15,727,481. The valuation of property and taxation for a series of years are shown in the following exhibit:

YEARS.	Real estate.	Personal.	Aggregate valuation.	State taxes, exclusive of school taxes.	Rate of total state tax, in mills, on each dollar of valuation.	Town, county, and school taxes.	Total taxes.	Rate of tax on \$1; valuation in cents.

—All the charitable, eleemosynary, correctional, and reformatory institutions of the state, except prisons, whether receiving state aid or maintained by municipalities or otherwise, are subject to the inspection of the state board of charities, composed of 11 members appointed by the governor with the consent of the senate, besides the lieutenant governor, secretary of state, comptroller, attorney general, and state commissioners in lunacy, all of whom serve without pay. The board reports annually to the legislature concerning the various institutions visited by them, which embrace the state, local, incorporated, and private charities for the insane, blind, deaf and dumb, idiots, inebriates, juvenile delinquents, orphans, paupers, &c. The number of insane in New York on Jan. 1, 1872, was reported at 6,775, of whom 1,093 were in state and 312 in private institutions, 2,233 in city asylums and almshouses, 1,319 in county asylums and poorhouses, 75 in the Auburn asylum for insane criminals, 161 in the institutions of other states, and 1,582 in the custody of friends. In 1874 \$102,234 was paid by the state for the maintenance of insane persons, besides large appropriations for buildings, &c. There are five state institutions for the treatment of this class, of which the oldest is the lunatic asylum in Utica, opened in 1843 and having accommodations for about 600. Acute cases are chiefly treated here, while the chronic insane are received in the Willard asylum, opened at Ovid, Seneca co., in 1869, which, with projected improvements, will accommodate 1,000. The Hudson river hospital for the insane in Poughkeepsie, the state asylum in Buffalo, and the homœopathic asylum in Middletown are state institutions not yet (1875) completed. The estimated cost of each of the two former is \$3,000,000; when completed each will accommodate about 600 patients. The institution at Middletown is smaller. On Sept. 30, 1874, there were 1,719 inmates, 590 being in the Utica asylum, 879 in the Willard, 212 in that at Poughkeepsie, and 38 in that at Middletown. There is also a state institution on Ward's island, New York city, for insane immigrants. In addition to these there are two city institutions in New York city, Brigham hall at Canandaigua, Marshall infirmary in Troy, the Providence lunatic asylum (Roman Catholic) in Buffalo, and the asylum at Bloomingdale, all of which are incorporated; and Sanford hall, Flushing, the home for nervous diseases at Fishkill, and the home for insane and nervous invalids at Pleasantville, which are private. The Bloomingdale asylum is one of the oldest institutions of the kind in the United States, having been opened in 1821, and has a wide reputation for the excellence of its management. Any person or association is prohibited by law from establishing or keeping an institution of any kind for the reception of persons of unsound mind, without license from the board of state charities. The whole
